The third paper presented was by Mr. W. Louis Carr (Member), and dealt with "The Influence of Town Planning upon the Public Health." The author explained how a scheme prepared under the Housing and Town Planning Act can influence the public health of a community, such as that of the district of Ruislip-Northwood, in the county of Middlesex, of which he is surveyor. They were the first Urban District Council to obtain authority from the Local Government Board to prepare a scheme, and now they have on exhibition a draft town planning scheme, including "General Provisions," for the consideration of the various owners included in the area. After due consideration of the objections raised by owners, the Council will shortly forward to the Local Government Board for their approval this draft amended as far as may be advisable.

The routine methods of procedure to obtain the sanction of the Local Government Board to prepare a scheme are set out in "Town Planning in Practice" (price 1s.), a booklet issued by the National Housing and Town Planning Council. The powers given by this Act are intended to be applied to land in any stage of development.

(1) An already developed area—probably a town built many years ago not on satisfactory lines. The Act in this case enables the authority to gradually re-model such town.

(2) Areas partially developed, or ripe for development, where a growth of the population is in evidence. The Act in this case gives power to an authority to frame such "General Provisions" as will ensure the future growth of a district on more satisfactory lines than those haphazard developments which the past has taught us to be expensive, unsatisfactory and insanitary.

A scheme prepared under the Act has a bearing upon the public health of a partially laid out and growing district as regards the following points among many others:—

(1) Roads (their width, construction, convenience to the community, relaxation of by-laws, &c.); (2) sanitation (sewers, refuse collection, &c.); (3) cemeteries; (4) sewage disposal works; (5) sites for public buildings; (6) open spaces (private and public); (7) building lines; (8) space about buildings; (9) limitation of numbers of buildings per acre; (10) height of buildings; (11) character of buildings; (12) protection from fire; (13) sanitary convenience and amenity (such as offensive trades, advertisement hoardings, fences and trees, streams, &c.); (14) allotments.

Mr. Carr then enlarged on these various heads. In speaking of No. 7 (building lines), he said he believed in foreign countries the building line is one of the chief and most important features of their town plan, and bears more relation to the other provisions of a scheme than anything else. On existing main roads, and those the Council consider are likely to become main roads in the future, a building line should be fixed and shown on the map, when it can be enforced under the Act. A minimum building line for the whole area to govern the width between buildings should also be defined—probably 60 feet is the least. As to building lines on any new streets of a width of 40 feet, he sug-

gested that the limitation of the number of buildings per acre is the most satisfactory way of controlling this. For instance, in the case of a 40-foot road in an area scheduled at eight buildings per acre the building line would probably be 15 feet from the boundary of the street, 35 feet from the centre of the road, and 70 feet between houses on either side. Building lines will also require to be determined for streets over 40 feet in width, for the projection of shops (in shopping centres), corner sites, bay windows, and certain public buildings to project beyond the general building line.

SPACE ABOUT BUILDINGS.

The proportion of site covered by buildings has to be settled, due regard being given to distinguishing the space to be allowed for a shop, warehouse, or dwelling-house. The space at the rear of buildings is a most important health matter, and a considerable amount of thought must be given to it. Reference may be made to the dark and ill-ventilated kitchens to houses, owing to the window opening opposite a high brick wall, perhaps only some 2 feet away. A clause should be inserted in any town planning scheme which will obviate this. The least distance should be 5 feet.

LIMITATION OF NUMBER OF BUILDINGS TO THE ACRE.

This is one of the most complex problems arising from any application of the Act, and requires separate consideration for every district. Each district will have to consider its own particular amenities; no standard can be fixed. In a manufacturing district the circumstances will be found entirely different from those of a residential area such as mine. At the same time, the question of any part of an area at present residential being converted into a large manufacturing centre must be considered. The Ruislip-Northwood Council are dealing with this question as follows:—

(a) The lands belonging to any owner which are contiguous, and which are not greater than five acres in extent, shall form a "land unit" within the several restricted areas. (b) In all other cases the lands which belong to the same owner, and which are comprised within each of the five-acre squares, shall form a "land unit" within the several restricted areas. (c) Provided that any lands comprised in any such square, which are not greater than two acres in extent, may, where such lands immediately adjoin other lands belonging to the same owner, be included with, and shall, together with such other lands, form a "land unit," but in no case shall any "land unit" be greater than seven acres in extent. The several restricted areas in the district are four, six, eight and twelve to the acre, and on one acre in a "land unit" not more than twenty buildings may be erected as dwelling-houses, and not more than twenty-four buildings of any other kind. Here is an example. On a five-acre estate in a restricted area of eight to the acre the owner may, if he wishes, build twenty houses on one acre, leaving the remaining twenty to be built on four acres. A landowner may take advantage of this very materially; he may have quarry workings, say, and build round the outside of them, and leave the remainder as open space.

HEIGHT OF BUILDINGS.

Provision under this heading should be made governing the measurement of the height of buildings in streets, for corner buildings, and storeys in domestic buildings in restricted areas where the limit exceeds eight to the acre.

CHARACTER OF BUILDINGS.

Areas should be scheduled for warehouse and factory sites, shops and business premises, compulsory and optional. As regards the size of living-rooms and bedrooms, the Ruislip-Northwood authorities are, in their scheme, suggesting that every new dwelling-house shall be provided with at least one living-room having a floor area of not less than 144 square feet, and containing not less than 1,152 cubic feet, and one bedroom having a floor area of not less than 135 square feet, and containing not less than 1,080 cubic feet. No bedroom or other habitable room in any such dwelling-house shall have a floor area of less than 70 square feet, or contain less than 500 cubic feet. In a restricted area above eight to the acre no domestic building shall be constructed for the use of, or be occupied by, more than one family, except in the case of a dwelling-house, or flats or chambers specially planned for the purpose, and every person who shall intend to erect a new domestic building, or alter any existing building within such restricted areas, shall, before commencing to erect or alter such building, deliver to the Council a statement in writing declaring whether such building is intended to be constructed for the use of, or occupied by, more than one family. In their "General

Provisions" they propose to limit the grouping of buildings to eight erected under one roof, or without a break in building down to the level of the ground level, and no such break shall be of less width than 4 feet.

External elevations to buildings should, in Mr. Carr's opinion, be governed to a certain extent by the local authority, subject to referring any dispute to the Royal Institute of British Architects.

All the above provisions as to "character of buildings" will tend to stop the miserable housing seen in different parts of England at the present time, and better lighting, ventilation and drainage are to be hoped from such clauses framed under the Act.

RELAXATION OF BY-LAWS AS TO NEW STREETS.

A Council should provide for some relaxation of the Model By-laws to apply to all their area, whether town planned or not, and Model By-laws are issued by the Local Government Board, in which may be filled in the desired width and form of construction. Here is an example of a by-law as to construction and lay-out approved in a certain district by the Board:—Thirty-six feet street (not greater than 900 feet in length), with 24-feet carriageway, 16 feet metalled; two 6-feet paths, 5 feet metalled; turning places for vehicles every 300 feet apart, the space between the metalled portions being suitably laid out with grass, trees or shrubs.

As regards the relaxation of by-laws in a town planning area, these will have to be framed so that they are capable of dealing with all cases of estate development, and by-laws will be put into the "General Provisions" for dealing with these. The width of any new street will be probably determined by its length, allowing for suitable turning places for vehicles, width of metalled roads and paths. A 20-feet street will probably be laid out with a 14-feet metalled carriageway and a 24-feet street with a 16-feet metalled carriageway. This would allow two vehicles to pass.

The keynote of the Act is for a local authority, in using the power bestowed by the Act, to relax, mitigate or waive immaterial by-laws in return for more material advantages which can be given by the landowner, so that the public may gain certain advantages without anyone being the worse or out of pocket.

It must also be borne in mind that the temptation to a public body to misuse or absolutely apply these new powers is very great, but unless they keep strictly within the bounds of reason and fairness the whole Act will be rendered nugatory and void. It must be remembered that a person developing an estate has to make it a profitable undertaking, and if the profits are unduly taxed by unfavourable imposition a state of stagnation will arise, or the development of a district will be seriously retarded and hindered, and its last state rendered worse than its first. The aim of all parties must be to give away what is unnecessary if any advantage can thereby accrue to the other parties, and to secure from them some tangible benefit in return; in other words, to obtain a quid pro quo.

APPENDIX.

Some particulars of the Ruislip-Northwood town planning scheme:—

Area of district	6,585 acres
Area in town planning area and scheme	5,690 "
" " " " " "	60 "
Area of excluded portions in town planning area	Outside Authority. 195 acres
Areas for proposed open spaces (in restricted area 4 to the acre)	21 "
Areas for proposed open spaces (in restricted area 6 to the acre)	None
Areas for proposed open spaces (in restricted area 8 to the acre)	100 "
Areas for proposed open spaces (in restricted area 12 to the acre)	56 "
Areas for restricted area 4 to the acre, all residential	1,310 "
Areas for restricted area 6 to the acre, residential and shops, and factories optional.	260 "
Areas for restricted area 8 to the acre, residential and shops	2,000 "
Areas for restricted area 12 to the acre, small residential, shops and factories optional	2,180 "
	5,750 "
Areas for factories optional, 110 acres.	
Areas for shops and business premises optional, 200 acres.	
Areas for shops and business premises compulsory, 54 acres.	

Mr. A. R. Bleazard, borough engineer, Clitheroe, argued that it must inevitably be more expensive to erect only ten or twelve houses to the acre than to put forty as under the old conditions. Another difficulty existed in, for instance, the north-east of Lancashire, where it was essential for people to live near their place of employment. It would be interesting to know how town planners were going to get over such a problem as that.

Mr. E. R. Capon said that town planning, when carried

out, will be a high ideal; but when that ideal will be attained it was difficult to say. His own Council had had the question under consideration for the past two years, and they had not yet got very far forward. Supposing there were ten owners concerned in a particular scheme, nine might agree, but if the tenth stood out the scheme was hung up. It was, he feared, going to prove a very costly affair to the ratepayers. A minimum height of 8 feet for rooms seemed to him much too low, because cottage property required higher rooms than better-class property.

Mr. A. E. Prescott, borough engineer and surveyor, Eastbourne, invited the meeting to come to Eastbourne for a lesson in town planning. There they had only two large landowners to deal with, both of whom were men of large minds. Twelve thousand trees had been planted in the streets, and most of the thoroughfares had grass verges. With regard to the latter, it seemed impossible to keep them in order unless they were protected with hurdles or railings. However, it was possible to put down gravel verges, which looked equally well, while not costing nearly so much. The chief thing for planners was to see that a new town was laid out on new lines, with a central point and wide roads. In the past towns had been too much under the jerry builder, who wished to erect two houses on a site where only one should be. The success of the Act depended very largely on the way in which the landowners were going to look at the question.

Mr. E. A. Strickland, A.M.Inst.C.E., borough surveyor, Windsor, advocated that every surveyor who has to deal with the apportionment of land should urge the provision of crematoria, instead of spending thousands of pounds on new land for cemeteries. By so doing they would be doing good both for the present generation and for the future.

Mr. W. Louis Carr, in replying to points raised by these and other speakers, mentioned that the general opinion seemed to be that twenty houses to the acre was going to be the maximum allowed by the Local Government Board. It was undoubtedly true that if the landowners were against a scheme of town planning the local authority would be able to do very little. Under the Act it was possible to get amenities of every kind. The Ruislip-Northwood Council had already secured over eleven acres of open space without the expenditure of a penny, and some of that land is valued at £800 an acre. With regard to the proposed minimum height for rooms in cottages, it was his opinion that 7 feet 6 inches was sufficient if there was extra superficial area. The cost up to date of the Ruislip-Northwood scheme, inclusive of everything, was £267. A site had been appropriated for the various municipal activities.

FOUR CONTEMPORARIES FROM OVERSEAS.

The American Architect (New York) illustrates some sumptuous decorative buildings in Hudson County Park, Hoboken, N.J., in which Mr. Arthur Ware, the architect, has followed Italian precedent in his treatment. There are also views of some recently built county and suburban houses.

Der Architekt (Vienna) has some interesting studies for the laying-out and building of the Palacky Kais at Prague by R. Wels, of Vienna; some designs by Professor Moritz Balzarek, of Linz; and a view of the new Rathaus at Bilin, of which Professor Dr. Friedrich Kick is the architect.

Arkitektur og Dekorativ Kunst (Christiania) gives a view, with plans and elevations, of a new public school at Bergen; premiated competition designs for a railway station; and photographs of furniture designed by architects.

Annali della Società degli Ingegneri e degli Architetti Italiani (Rome) for once is more architectural than engineering, and contains a full series of views of the new Government offices for the Ministry of Public Works and Telegraphs of Mexico, the work of Silvio Coutri.

Bauwelt (Berlin) makes a special feature of modern church architecture in Germany, wherein Romanesque and *Neubau* feeling seem to largely influence the design.

Construction (Toronto) illustrates fully Ottawa's great hotel, Château Laurier, of which Messrs. Ross & Macfarlane are the architects. A bungalow residence in Victoria, British Columbia, forms the text of an article on "The factor of environment in domestic design."

La Construction Moderne (Paris) gives illustrations of the Salon d'Honneur in the French section of last year's exhibition at Turin; a modern house in Venice; and a cottage-house at Fresselines, which is a welcome departure by M. Henri Gray from the usual type of French country house.

FORTHCOMING EVENTS.

Monday, November 11.

- Architectural Association : Paper on "Marbles used in Greek, Roman, and Byzantine Buildings," by Mr. J. A. Marshall, at 8 p.m.
Surveyors' Institution : Presidential Opening Address by the Hon. E. G. Strutt and other business at 8 p.m.

Tuesday, November 12.

- Royal Sanitary Institute : Discussion on "The Report of the Departmental Committee on Intercepting Traps and House Drains," to be opened by Mr. H. Percy Boulnois, M.Inst.C.E., at 8 p.m.
Nottingham Architectural Society : Fiftieth Anniversary of the Society, Conversazione at the Exchange Hall at 8 p.m.

Wednesday, November 13.

- Northern Architectural Association : Presidential Opening Address by Mr. Wm. Milburn, F.R.I.B.A., at 7.30 p.m.
Edinburgh Architectural Association : Associates' paper on "Town Planning," by Mr. A. Lorne Campbell, F.R.I.B.A., at 8 p.m.
Egypt Exploration Fund : Ordinary general meeting at Burlington House, W., at 4 p.m.

Thursday, November 14.

- Sheffield Society of Architects and Surveyors : Paper entitled "Some Notes on Surveying" by Mr. F. H. Wrench, A.M.Inst.C.E., Lic.R.I.B.A., at 7.30 p.m.
Concrete Institute : Presidential Opening Address by Mr. E. P. Wells, J.P., at 7.30 p.m.

THE STUDY OF ARCHITECTURAL HISTORY.

THE house of B. T. Batsford "has the pleasure to announce the publication of an entirely new History of Architecture by an eminent author, attractively written and richly illustrated."*

It might have been doubted whether at this period there is room for another history of architecture, but a very short inspection of the publication which Mr. Batsford announces will convince the doubter of the fact that there is not only room, but a necessity for a handbook treating of the history of architecture in the manner that has been adopted by Mr. Statham.

It has been too much the custom amongst writers and compilers of architectural history books to deal with the development of architecture as a matter that could be chopped up into divisions, each labelled and called a "style," of which the distinguishing marks were to be found in various treatments of mouldings, features, and ornament that apparently had a particular period or phase of development and might be pigeon-holed and labelled as separate and distinct entities.

In the publisher's circular it is put forward that "it is realised that the time has come when every person of culture is desiring to have the same acquaintance with architecture that is possessed on such other subjects of intellectual interest as history, painting, or music, and Mr. Statham's book has been specially written to impart or increase such knowledge." The publisher in making this statement to the non-professional reader hardly, we think, does sufficient justice to the scope of the new history of architecture.

Mr. Statham's book, carefully studied and assimilated, will give the student of architecture, whether amateur or professional, a very intimate acquaintance with architecture and, what is of far more importance, a comprehension of the development of architecture as the result of the solution of problems of building connected with, firstly, the provision of plans and arrangements for specific needs, and, secondly, with the construction of buildings suitable to the requirements of accommodation, the facilities of the building materials available, and the abilities of the builders to make adequate use of those facilities.

The new history of architecture is, in short, based upon constructional necessities rather than accidentals,

hence we do not find rigid adherence to time or locality when the author is dealing with a practical method of construction; thus in discussing the treatment adopted in the building of domes those of Southern France are compared with earlier structures in Persia or in Greece.

At the same time the progressiveness of architecture in the solution of building problems down to the commencement of the Renaissance movement enables the writer to maintain a fairly regular chronological sequence in the treatment of his subject, and to present the history of architecture as a continuous development in point of time as well as in methods of construction. Mr. Statham has also been careful to explain that architecture is not merely of utilitarian origin, but is the expression of an ideal in which each detail is of æsthetic consequence; thus the reader is led to consider what are the influences and what the treatment of design which have gone to make good or bad architecture.

Although, however, the author is critical in his treatment of history, he does not give an entirely exhaustive exposition of the influences which have gone to form architecture, but leaves a certain field open for the consideration of the reader; thus in calling attention to the varied positions of columns in monumental work, it is pointed out that in Egyptian architecture the columnar effects were all internal; in Greek and Roman architecture the columns emerged from their obscurity and were ranged on the exterior of the temple; in Latin and Romanesque architecture, mainly for structural reasons, the column became again an internal feature; but the reasons for these changes are not explicitly given.

This is, in fact, one of the chief merits, to our mind, of Mr. Statham's treatment of history; it is not a collection of facts, dates, and figures which might be learnt by heart by the student who is cramming for an examination, but it is a critical and thoughtful exposition of the development of architecture in which the reader is given the benefit of the acumen of a learned and keen observer and critic, and at the same time is led to think for himself and to make his own observations and criticisms.

When he does so he will sometimes no doubt differ in opinion and conclusion from the author. He may, for example, not be inclined to agree with Mr. Statham that the typical form of the Corinthian capital is rather Roman than Greek, particularly when he has before him the charming illustration of a Corinthian capital from Epidauros to which Mr. Statham attributes a probable date of 400 B.C. The Bassae example and that of the temple of Jupiter Olympius at Athens might also justify

* *A Short Critical History of Architecture.* By H. Heathcote Statham, Fellow of the Royal Institute of British Architects, Member of the Hellenic Society, and of the Society for Roman Studies, &c. (London: B. T. Batsford, 10s. net.)

him in arriving at the conclusion that the typical form of the Corinthian capital was evolved and settled by Greek artists, although modified in detail by Roman workmen; even the invention of the Composite order he may be disposed to regard as Greek rather than Roman with the example before him of the capital from the temple of Jupiter at Aizani in Asia Minor.

He may also be inclined to believe that Mr. Statham is hardly justified in maintaining the nineteenth century view with regard to the irregularity of plan of the Erechtheion, particularly if he has become acquainted with the fact that many archaeologists are now prepared to admit that a western wing was intended to correspond with the eastern, and he may justly be supposed to ask if it were probable that any sensible architect at any period of history, still less a Greek architect in the days of Pericles, would have been guilty of such an absurdity as to erect a magnificent approach to a building, like the north portico of the Erechtheion, so badly placed that it actually projected beyond the plan of the building to which it is the presumed entrance. It is scarcely possible to doubt, from a common sense point of view, that this north portico was intended by its designer to be the central feature of a façade, symmetrical so far as the conditions of the site would allow, or that it was built before the necessity was recognised that the original intention of the designer was impossible of realisation, although this contingency was accepted when the position of the so-called caryatide portico was settled.

One could go on to suggest other differences of opinion that the thoughtful reader might form, but the possibility does not detract from the admirable character of this critical history whose function is, we are sure, in the desire of the author, to stimulate the intelligent consideration of architecture rather than the plain acceptance of dogma, even from a master of criticism.

We would rather turn to other excellences of this new history. Whilst the masterpieces of architecture which have become familiar by repeated delineation time after time are not omitted, there is a delightful feeling of freshness in the numerous illustrations which the author has included of essentially instructive buildings which have escaped the notice of, or been ignored by, other writers. Mr. Statham, moreover, has not been content to borrow his history from the works of others, but has gone beyond them and introduced to the student the results of modern investigation and research, many of them the individual work of the author.

From the mere point of view of a picture book more than 700 excellent illustrations make the volume of high interest to the amateur and of surpassing value to the professional student. To the latter we may commend this newest history as being within the limits of its size and price the most valuable handbook that has yet appeared in the English language for those who wish to understand the architecture of the past.

NOTES AND COMMENTS.

THE remarkable collection of drawings with which the walls of the Royal Institute were adorned on the occasion of the opening meeting of the Session on Monday last filled us with a feeling of regret that they could not remain on view for longer than the one evening. We cannot help wishing that the occasional glimpses which are vouchsafed to members of the wealth of draughtsmanship and illustration hidden away amongst the Institute's possessions could be amplified into a series of exhibitions, which would not only be instructive to architects, but, if run on business lines, might be a source of income to the Institute, and would certainly help forward what is eminently desirable, the rapid growth of that dawning interest of the Philistine in architecture which is one of the most encouraging signs of the times and should certainly be accelerated by the Institute to the utmost of its power.

Hall i' th' Wood, Bolton, Lancs., is perhaps one of the best known examples of half-timber building in the country from the multiplicity of drawings, sketches, and photographs of it that have been made and published, but that, nevertheless, does not argue a lack of judgment on the part of the recently retired Professor of the Manchester School of Architecture, Mr. S. Henbest Capper, in selecting the building for the first essay of the School in its publication of a portfolio of measured drawings by its students. Mr. William J. Roberts, the student whose name is appended to the drawings, has done his work with effectiveness of presentation, but without that completeness which should, we think, be the dominant note of such a publication under University auspices. We should have liked to see the first part of the Manchester School's Portfolio of Measured Drawings so complete a record of the building measured that if it should, unhappily, be burnt down, it could be rebuilt in exact facsimile. Not that it need be. Instead of this we have a few excellent drawings which appear to be a student's study of what appealed to him, and his excuse for incompleteness is naive. "The back elevation is so purely archaeological (sic) that it was thought to be hardly worth measuring. The date of it will be somewhere about 1600." The first floor plan and the sections are also presumably "so purely archaeological."

The Manchester Art Gallery is fortunate, and deservedly so, in having received a gift from Mr. Charles Shannon and Mr. Charles Ricketts of five plaster models by Alfred Stevens for his projected decoration for the dome of St. Paul's Cathedral. The *Manchester Guardian* says of these schemes, unfortunately never carried out: "The two reclining figures represent St. John and St. Mark, each with his traditional symbol. The statuettes are of Jael, David, and Judith. All are roughly modelled first conceptions, but they have both charm and significance. What an artist sees and seizes first is an indication of his temperament. In the case of these little studies by Stevens we notice how entirely he was concerned with the æsthetic rather than the human conception of his subjects. Jael's hammer, David's sling, Judith's sword, are merely symbols and their wielders are mere figures, not the individuals, intensely conscious of their mission and perhaps grotesquely human, that Reinhardt would have made of them in a painting or etching. But in both cases a fundamental conception of art is represented, and in these little figures by Stevens we have the sense of rhythm, the power of imaging types purged of individual peculiarities, and—looking at them as sculpture—the sense of mass and line that we call classical. Jael, in fact, has the charm of a Tanagra figure, and the head of Judith is beautifully formed and poised; and the other figures show in their own way the instinct for decorative fitness in which Stevens was supreme among English nineteenth-century artists. The set forms a delightful addition to the collection of modern sculpture which is gradually taking shape in Manchester."

We are glad to note the point of view of Archdeacon Norris, who, speaking at the Art Exhibition at Halifax Technical College, urged the value, even from a material and commercial point of view, of the general education of the public in appreciation of art by means of a carefully, wisely, and reverently chosen collection of pictures, sculpture, and so forth, including, we may hope, architecture. The Archdeacon said that the appreciation of what was beautiful and good was largely a matter of education. He was glad to say that nowadays in the nursery and the schoolroom we tried to surround children with good pictures and artistic decoration, and this would tend to improve the general artistic taste. It was not only the duty of public authorities to see that every opportunity was taken to teach people the power of selection in the matter of sight, but undoubtedly in industrial towns like Halifax, with the trades that were characteristic of the district, it was commercially important that this should be done. Was it seriously supposed that Leeds and

FROM SKETCHES SUBMITTED BY MR. J. R. LEATHART FOR PUGIN STUDENTSHIP, 1912.

Bradford took this matter up merely as a hobby, or did it for fun? Was it ever considered why it was that one town went ahead in textile manufacture, and another town stood still? Ultimately it was to a large extent a matter of design. The other day a prominent Halifax citizen, one of the few who had tried to help art, said in effect that it was not much good trying to put beautiful things before Halifax people, because owing to the dinginess and duskiness and the severity of their surroundings they could not appreciate them. He ventured respectfully to disagree with him. A great many of the working people of the district could appreciate beautiful things, but apart from that, his main reason for wanting works of art to be within easy reach of the public was because they lived in such dingy surroundings.

A rather belated and adjourned report respecting the fatal fire at Moor Lane in the City of London in July has been presented by the Building Acts Committee to the London County Council, which, whilst it justifies the Council, also, we consider, contains some useful lessons. In 1898 the Council served on the owners sealed notices requiring the provision of additional means of escape in case of fire from Nos. 19 and 21 Moor Lane, and Nos. 66 and 67 Milton Street, which were then, with the exception of the basement and ground, first and fourth floors of No. 21 Moor Lane, in the occupation of a firm of printers. The fourth floor of No. 21 was occupied by a firm of ladies' tailors, and the basement and ground and first floors by several other firms. The Council's requirements included a new incombustible staircase in each building and a gangway, with doorway access, between Nos. 19 and 21 Moor Lane, on each of the upper floors. The case was referred to arbitration, and

the arbitrators failing to agree, the umpire issued an award requiring the provision in No. 21 Moor Lane of a new incombustible staircase connected with all the floors and access to the roof from the top floor independent of the staircase, but the doorways and gangways required by the Council were omitted. The owner provided the required access to the roof, but appealed against the requirement for the new staircase on the ground that its construction would involve a trespass on the basement, ground, and first floors, which were in different occupations. The High Court upheld the appeal and remitted the case to the arbitrators, who then issued an amended award requiring some minor alterations of the then existing staircase, which was enclosed with matchboarding, and the provision of balconies between Nos. 21 and 23 Moor Lane, with window access thereto from both buildings. The means of escape were completed in accordance with this award. A staircase leading to the roof from the fourth floor was also provided. The drawings of the work as completed showed the fourth floor to be divided into two rooms by a wooden partition, in which was a doorway fitted with a door. This door was subsequently removed, and a doorway, giving direct access to the main staircase from the front room, was blocked up. The window access to the balcony leading to No. 23 was in the back room close to the doorway in the partition. In 1906 a firm of Christmas card manufacturers took the two rooms. No notice was given to the district surveyor of any of these changes. At the time of the fire a large quantity of celluloid, about 1,600 lb., was stored on this floor, and the outbreak was due to some lighted sealing wax being dropped on to a parcel of the celluloid in the front room. This occurred when eighteen women and four men were employed in the

front room, and fifteen women in the back room, whence the only means of escape to the principal staircase was through the front room. All of those engaged in the front room and two of those in the back room escaped down the main staircase. The remainder went up the staircase leading to the roof, and ran to the left to a part from which escape was almost impossible. Had they turned the other way they could have reached the roof of No. 23 Moor Lane, when they would probably have been rescued. It would appear from evidence given at the coroner's inquest that the failure to use, as a means of escape, the balcony leading to No. 23 was due mainly to the fact that a ventilating fan in the rear wall of the back room drew the flames across the window opening to the balcony, and that this was facilitated by the removal of the door from the doorway in the partition. It would also appear that access to the balcony was obstructed by goods, and that the notice "exit in case of need" had not been maintained. Taking all the facts into consideration, it appears likely that there would have been no loss of life had the owners complied with the Council's requirements. The inquest was held on July 26, 27, and 28 and August 2. At the conclusion of the evidence the coroner addressed eighteen questions to the jury, and the more important answers were to the effect that—(i.) No criminal blame attached to anyone. (ii.) The factory inspector was responsible for seeing that the means of escape were maintained. (iii.) The exits were reasonably safe, but handrails should have been provided to indicate and render safer all routes of escape over adjoining premises, and the second doorway between the front room and the main staircase should not have been blocked up. (iv.) The blocking up of the doorway between the front room and the main staircase and the removal of the door in the partition between the two rooms were not structural alterations. The jury also found that the quantity of celluloid on the premises was too large for one building, and that one of the first things which should have been done on the outbreak of the fire was to switch off the ventilating fan, which, in conjunction with the open doorway in the partition, was, as previously stated, the main reason for the failure to use the balcony provided as a means of escape. We would add that we do not concur in the opinion of the jury that the alterations made were not structural alterations. During the last session of Parliament the Bill promoted by the Council for the regulation of the storage of celluloid was thrown out, but a departmental committee has since been appointed by the Home Secretary to inquire into the questions of the storage and use of celluloid.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first general meeting of the seventy-eighth session of the Royal Institute was held on Monday, November 4, at 9 Conduit Street, W., Mr. Reginald Blomfield, A.R.A. (President), in the chair.

The Secretary stated that the Council had nominated twenty gentlemen for candidature as Fellows and fifty-two as Associates of the Royal Institute. It was also announced that M. Stanislas Louis Bernier, President of the Société Centrale des Architectes Français, has been nominated for election as Honorary Corresponding Member. It was further announced that the Council, in the exercise of their discretion under By-law 78, have admitted the Hampshire and Isle of Wight Association of Architects to alliance with the Royal Institute.

Mr. Blomfield then gave the following

Opening Address.

It has become the custom of this Institute to look to its Presidential Addresses for announcements on matters of serious interest to the profession, for the foreshadowings of policy, sometimes for sanguine anticipations of ideals that we should all like to see realised. You will recollect the frankness of my predecessor in this chair, and the zeal with which he attacked the difficult problems which confronted him during his term of office. Many circumstances combined to make his tenure of office more than usually full of

arduous situations. I who have the honour to succeed him do not look for a series of alarms and excursions. Rather, so far as I can see, the time has come for a steady consideration of our position, and for a period of serious, if less brilliant, development on practical lines. I hope I shall not disappoint you if I say that I have no heroic policy to offer you, no infallible panacea for the many difficulties that lie before us; but I shall ask you to follow me in the suggestions which I shall put before you as to the present position, and to help me on your part with your clear, unprejudiced, and close attention.

The points which I would ask you to consider with me to-night are: The position of this Institute; the position of the architect; registration; and education. I will deal first with the position of the Institute.

We have in the last two or three years incurred a large expenditure, and this has induced some anxiety among our members in regard to the future. I think I can safely reassure any member who has an uncomfortable feeling of insecurity. As a body this Institute has never been so strong as it is to-day. The total of its membership, including Licentiates, amounts to some 4,700, in addition to the numerous class of probationers and students from whom the members of the future will be drawn; and I would remind those of the latter class to whom the Insurance Act applies that an Architects' and Surveyors' Approved Society under the Act has lately been formed by the Architectural Association, with the approval of this Institute and of the Surveyors' Institution. The net-work of Allied Societies, working in close relation with the central body, now covers not only the United Kingdom, but practically the whole of the English-speaking Dominions, and your Council has recently taken in hand the consideration of the relations of the Allied Societies *inter se* and to this Institute, in order that no district shall be without a representative body to assist the architects practising within its boundaries. The constant reference to the Institute in matters of public importance I need not touch on, because it is a matter of common knowledge to all of you. In regard to our financial position, as freeholders of these fine premises which have recently been enlarged and improved, the Institute is in a more secure position than it was two years ago, when it was merely the holder of a lease of half these premises with some fifty years to run. Such a serious undertaking has necessarily put a temporary strain on our finances. In the years 1909, 1910, and 1911 the Institute spent about £31,000 on the purchase of these premises and their repairs and re-arrangement, skilfully carried out by our Hon. Secretary, Mr. Hare. In addition to this, the Town Planning Conference involved a capital expenditure of £2,235. To meet these liabilities the Institute had in hand £21,095 capital. The result was that during these years we had to borrow from our bankers the sum of £12,144. But the soundness of our finances is shown by the fact that by the end of last year our indebtedness was reduced to some £9,000, and we have reason to believe that in this and following years an annual surplus of income over expenditure will enable us to reduce our debt by at least £1,000 a year. I need hardly say that the sooner the whole of this debt is wiped off the better, and this is the more necessary as there still remains to be dealt with the mortgage of £4,000 which we took over with these premises from the Architectural Union Company. There is much that the Institute would like to do, and yet hopes to do in the future, which your Council do not feel justified in undertaking till this debt is cleared: our splendid architectural library, for example, perhaps the finest in this country, should be kept up to date by the purchase of the best contemporary publications both in this country and abroad, but at present your Council is not always able to follow the legitimate representations of the Literature Committee for financial reasons. Then there is the pressing question of the payment of our Examiners, long ago recommended by the Board of Architectural Education, but as yet unrealised for the same reason, and all that the Institute can offer to these gentlemen who place at its disposal their highly skilled and valuable services is its platonic, if very genuine, gratitude. I would remind you also that the promotion of registration, whatever form it may take, must in any case mean the expenditure of money, possibly of a good deal of it. I venture to suggest one obvious means of adding to the sinews of war, and that is that those Associates who are qualified for the Fellowship should take up their Fellowship without further to do. The status of a Fellow of the R.I.B.A. is assuredly a distinction, and I suggest to you that all our Associates ought in due course to proceed to the

Fellowship, and that the senior Associates should give a lead to their juniors by taking up their Fellowships at once. I appeal to you as good sportsmen to lend a hand in this very practical way, having regard to the facts that I have now laid before you. I would say again that our position is perfectly sound, but it is only common sense to deal with our existing liabilities before we embark on large enterprises, whose end, however desirable, must be to some extent problematical.

The position of the architect as a professional man has given ground for a good deal of anxious consideration in the last year or two. Adverse verdicts have been given in the Courts, which appear to saddle us with unfair and impossible responsibilities, and there can be no doubt that the position of a practising architect to-day is more difficult than it was forty years ago. He is expected to know a great deal more, and to do a great deal more for his money, than was expected of his predecessors in the halcyon days of the seventies. Applied science has developed so fast and in so many directions that it is impossible for an architect to keep pace with every branch of it; and, beside all this, he has his own art to master. For when all is said and done, the first business of an architect, that which differentiates him from other men, is his power and knowledge of design; and that, in the chaos of modern styles and the kaleidoscope of fashion, is not less but more difficult to acquire now than it was 150 years ago when everybody worked in one manner as a matter of course, and every village builder knew the Orders. And it is more difficult than it was fifty or sixty years ago when hygiene was a negligible quantity, electricity as a commercial power unknown, and the builder was a man who really knew something of the practice of building. At the same time, I think there has been an unnecessary scare in this matter. We architects have, and have always had, our responsibilities to our clients, and, provided an architect knows his business, watches his work, and takes due care of his clients' interests, I do not think his position is one of greater danger than that of other professional men. The pressure of competition is keener than it used to be, and the standard of attainment is higher, but this is due in the one case to causes beyond our control, in the other to our own efforts; and what we have to do is, on our part, to qualify ourselves for our responsibilities, and to stimulate in the public a more intelligent appreciation of the services that an architect can and ought to render. If the public understood that an architect is an individual with the necessary limits of an individual, and not merely a wholesale *entrepreneur* on the one hand, or a building policeman on the other, there would be less of the regrettable misunderstandings that sometimes occur in the practice of architecture—but architects should not forget that the only effective passport to the appreciation of the public is the merit of their own personal work, and that if the profession of architecture is to receive a higher recognition in the State than it obtains at present, it can only do so by insuring a high standard of education and attainment among its individual members.

This brings me to the thorny question of registration. In this matter, if you will bear with me, I wish to explain certain developments that have formed part of the history of this Institute. Over twenty years ago I had the honour to be an Associate Member of Council, and about that time a move was made in the direction of registration, which appeared to some of us, old as well as young, to be heading off architecture into a cul-de-sac of unmitigated professionalism. But since those days much water has flowed under the bridge. Free discussion has cleared away the misunderstandings of earlier days, the Institute has taken a very active and, if I may say so, in regard to its members, self-sacrificing part in the reorganisation of education, and there has grown up a fairly general consensus of opinion that registration, in some shape or another, is desirable, not only in the interests of architects, but in the interests of the public. So far this Institute is pledged to the policy stated in the report of the committee of 1907, and your Council has for some years endeavoured to give effect to that policy. Your Council can hardly hope to produce a scheme that will at once satisfy all, or nearly all, shades of opinion, and also be within the range of practical politics—this last is important—for I think you will agree with me that, if you run a horse, you should run him for all he is worth, and that it is unworthy of serious men of affairs to waste time and money on mere *ballons d'essai*. We are after a practical scheme, one that will protect both the public and architects. Various solutions have been proposed. So far none of them have met with general acceptance, but it must not be supposed that the labours of the last few years have been wholly

in vain. They have at least shown us some of the difficulties in the way, and have brought it home to thoughtful men that this is a very difficult and intricate problem not to be settled off-hand, and that if a real and satisfactory solution is to be found for it, that solution will have to be built up by careful and exhaustive consideration of the case in all its aspects; of what is required by the public, of what is due to the architect, and of the effect of any such scheme on other professional bodies whose interests may be affected. And if after this careful consideration it is found to be impossible to go quite so far as some of the more ardent of our registrationists might desire, I would remind them that half a loaf is better than no bread, and I would appeal to them, and, indeed, to all of our critics, to have patience and not to take the bit in their mouths and bolt. It is no use striking before the iron is hot, and it has become clear that there are many issues to this question, all of which must be dealt with before it will be possible to reach the psychological moment of solution. The conditions of modern society are so complex that it is impossible to deal with any of its problems in watertight compartments. What may appear to us as very clearly in the public interest may seem less convincing to our neighbours on the other side of the fence; and the experience of history is conclusive that drastic changes are not to be made *uno actu*. If such changes are to take their permanent place in the social organisation, they will only do so as the result of much previous effort, of anxious thought, of the slow attrition of those awkward angles which have split up many a well-meant scheme of reform. One of the first acts of your new Council has been to appoint a large and carefully selected committee to consider the whole question of registration, and it has strengthened it by the addition of a number of representative members from the provinces. I would ask you to give this committee time to deal with the question in all its bearings, and, when the recommendations of the Council come before you, not to look for impossibilities, but to give it your careful consideration as practical men of affairs, and with an anxious regard to the future of architecture. For, after all, whether members of the Council or not, we are but trustees for the next generation, and it should be our business to hand on our inheritance, not tarnished or diminished, but greater and more splendid, because it is held on the terms of a higher standard of attainment. On one point I feel sure we shall all agree. The object of a registration scheme should not be to make architecture a close profession, regardless of professional skill. We do not want to repeat the history of the Trade Guilds in their later days, when their object was to surround their members with a jealously guarded ring-fence of monopoly. Our object is to put a stop to incompetence, and to establish and maintain a reasonable level of accomplishment, and to see that that level is reached by those who undertake the very responsible work of an architect. There is not a man in this room who would say "*la carrière ouverte aux talents*," but what we insist on is that the "talent" should really be there, and that is the substantial issue to which registration should be directed. It should be really and effectually the hall-mark of professional competence.

So, by this roundabout way, we come back to the vital question of education, or, rather, as I should prefer to put it, a sound and thorough professional and artistic training as the basis on which any form of registration must be founded. If we are to obtain public and formal recognition of the fact that architecture is not an art that can be practised by Dick, Tom, and Harry with advantage to the community, and that there is a difference in kind between the work of the trained designer and the architectural efforts of the gentleman who combines the practice of architect, auctioneer, and estate agent, we shall see to it, not only that our present standard is maintained by all who enter our ranks, but also that it is slowly and surely raised, so that there can be no question as to who is and who is not qualified to undertake the work that legitimately falls to an architect.

It is to this object that the Institute, through its Board of Architectural Education, has steadily applied itself during the last few years. Sir Aston Webb was the first and most admirable Chairman of that Board. I had the honour of succeeding him, and we can both testify to the unswerving sympathy and support which the Institute, through its Council, gave to that Board, and thereby enabled it to carry out the important and far-reaching reorganisation of architectural training, which has been quietly going on for the last few years. The syllabus of training for architect-

tural students has been thoroughly overhauled, and quite recently a serious attempt has been made to render our examination a more effective and intelligent test of architectural capacity, and also a real stimulus to the artistic enthusiasm of our students. Design, the adequate invention of buildings which are good to live in and to look at, is, after all, the essential object of our training. Many studies are necessary as subsidiary to this, but the aim of our training must always be to make our students competent architects, artists to whom the methods and materials of buildings are as his canvas and colours to the painter, or his bronze and marble to the sculptor. The initiation of a test in design, which is to some extent competitive, is an important step forward and a further development of that reorganisation of our methods of training which has been one of the most valuable constructive works carried out by the Institute during the last few years. And by design I do not mean scene-painting. Under modern conditions it is more than ever imperative that power of design and knowledge of construction should go hand in hand—that the architect should have the technical knowledge of building necessary to realise the flights of his imagination. Where the engineer stops at construction, the architect, as an artist, sees further possibilities of beautiful form and its combinations, and he should possess sufficient knowledge, at any rate, to start the realisation of these possibilities.

At the meeting of the British Association in September last Professor Archibald Barr gave a very able address on the duty of the engineer to the community, and in the course of it called attention to the unfortunate severance of engineering from artistic design. The engineer, he said, takes a too exclusively utilitarian view of his calling, and architects have not sufficiently mastered the science of steel construction to be able to design in it freely. I think there can be little doubt that Professor Barr is right in his contention; and the conclusion to be drawn from it is that in the modern practice of architecture the necessity of the study of scientific construction becomes more and more urgent. That is a point that will not be lost sight of in our scheme of architectural training, and I may assure you that on this point our Examiners are adamant. Yet there are one or two considerations which I venture to offer, to reassure the old-fashioned lover of bricks and mortar. I do not believe that the whole future of architecture rests with steel construction or reinforced concrete, any more than I believe that the whole future of painting lies with the post-impressionists or the Cubists. Brickwork and masonry must always hold their place in building, and though architects will do well to avail themselves of all the resources of applied science, that is no reason for throwing up their familiar tools and rushing headlong into methods, however brilliant their promise, which have not yet stood the test of time.

We artists have to live in an age of science, and science is steadily invading the territory of the arts; not content with brushing us aside as people of no account, it has stolen our one ewe lamb—it has annexed the term "beauty" for its own purposes, and misled the public by using it in a sense of its own. In consequence of this insidious misuse of the middle term, we artists wake up to find our work judged by irrelevant standards, and condemned accordingly. One hears the term "beauty" applied to subjects so diverse as St. Paul's or Westminster Abbey, to the steel-work of the Gare d'Orléans, or to some complicated piece of machinery. Now, it is obvious that the same thing cannot be meant in each of these instances. In the case of the buildings, we mean that our sense of rhythm and proportion, our enjoyment of light and shade and the like are gratified; in the two latter cases that we derive intellectual satisfaction from the exact solution of a problem of construction or mechanical function; and it is only because we are lazy or careless of speech that we talk of "beauty" in the case of the steel roof or the steam engine. There is, of course, a borderland, where our pleasure is partly æsthetic and partly intellectual, such as the scale of a great dam, or the lines in perspective of an ironclad. But from the point of view dealt with by Professor Barr I suggest that the term "beauty" as applied to steel construction means technical beauty; that is, that its appeal will be to the intellectual satisfaction given by perfectly efficient work, rather than to the æsthetic enjoyment to be derived from the "ordonnance" of noble architecture. One is, therefore, the less daunted, and I do not think that architecture is going to be stranded high and dry by the engineer; but I heartily endorse Professor Barr's appeal for more thorough study of construction and for closer co-operation between the engineer and the architect. The

two should pull together, and should do so from the first. It is no use asking an engineer to design a bridge, or even a shopfront as was recently suggested, and afterwards calling on an architect to invest it with "artistic merit." Both architect and engineer will have their views on the main form and distribution, but they will have studied the problem from different points of view, and it is only by laying their different points of view together, before the treatment of the problem as a whole is decided on, that it will be possible to attain the unity of effect essential to monumental architecture.

I would take this opportunity of expressing our appreciation of the admirable spirit in which several of the Universities have endeavoured to give effect to the Institute scheme in their schools of architecture. The control of the Institute over the training of architectural students has been placed on an efficient basis by the organisation of the system of external Examiners. The Institute has been brought into satisfactory relations with the Universities, and is now recognised by them as the official centre of reference for questions concerned with the training of architectural students. We have our representatives in the schools of London University, the Architectural Association, Cambridge, Manchester, Liverpool, Sheffield, Glasgow, and Edinburgh; and, finally, at the invitation of the Board of Education at Whitehall the Institute has undertaken to conduct next year the examinations in architecture of candidates in the National Competition of Art Students. The horizon of the work of this Institute is steadily widening, and the part that it is called on to play in the training of architects becomes each year of greater importance, of vital importance, to the next generation of architects, and scarcely less so to the public and to our own members, because, as I have ventured to assert already, trained technical ability must be the basis of statutory recognition.

In this branch of the work of the Institute prospects are very much brighter than they have been hitherto. The Jarvis bequest has placed at the disposal of the Institute annually a scholarship of £200 a year tenable for two years; and within the present year, through the generosity of the Commissioners of the 1851 Exhibition, the new School at Rome, long dreamt of by this Institute, has been established by Royal Charter. The first instalment of the building is already in hand, and a scholarship of £200 a year tenable at this school for three years is to be awarded annually. The Institute has offered its hospitality to the Commissioners in regard to the examination for this scholarship, which will be the blue ribbon of the year. The jury will be the Faculty of Architecture, all of whom are members of this Institute. In these scholarships, and in the gold and silver medals of the Royal Academy, not to mention other scholarships and prizes, there are solid inducements to tempt the young man of genius out of his hiding. The importance of the scholarships tenable in the School of Rome will be obvious to all who recall their own days of studentship, those aimless and often solitary wanderings on the Continent, pleasant enough as a sketcher's pilgrimage in search of the picturesque, but of little value as artistic training, owing to the absence of intellectual discipline and authoritative guidance. Indeed, as a student of the development of architecture, I am sometimes tempted to attribute the weak points of the architecture of the last fifty years to the habit of indiscriminate and undisciplined sketching. I regret to admit that we have all of us done it: sometimes, it is but fair to say in self-defence, from the sheer pleasure of drawing some very drawable object—the sheer joy of draughtsmanship—more often, I fear, from a certain laziness and disinclination for the hard thought involved in the critical analysis of architecture. The results, alas! have too often been an unlicensed orgy of details snatched from every land and every style. But the sketching and measuring of actual buildings with a clearly realised object, and carried out with the aim of artistic analysis, becomes of inestimable value to the student, especially when checked by the free discussion of students working together. For the first time students will have the chance of working together and in touch with their brethren the painters and sculptors in that city which must always be the mother of the arts. The School at Rome may take years of patient effort to perfect, but we may look for great things from it in the next generation. One of the most serious difficulties in the modern practice of architecture is the absence of tradition, the want of a common method and of a recognised standard of attainment. It is not too much to hope that in lapse of time it may be the privilege of the students at our School

at Rome to restore this method and standard. That ideal is still far distant, and to complete our programme we must go further afield and enlist the help of all who care for our progress in the arts. I think the time has come when closer attention than it has hitherto received is due to the organisation of training in the arts in this country. Excellent work is done in our schools, but the schools are not sufficiently organised *inter se*, and there is need for further development both in regard to this and also in regard to the advanced stages of training in the arts. Our schools bring the students up to a certain point, and far ahead for the brilliant few there will be the artistic paradise of the School at Rome, but there is an interval between these stages to be bridged over, so that others, not among the brilliant few, yet good men too, may have the benefit of the most advanced training in design, with all the resources of a great establishment and the benefit of the skill and experience of the most competent artists. I believe that the want can be met by the development of existing institutions, but it is one that will require very serious and anxious consideration, in co-operation with such educational establishments as the Royal Academy.

In this short survey of the present situation of what I may call architectural politics I have endeavoured to indicate a certain unity of idea, and even of fact, that underlies the whole position. If the architect is faced by graver responsibilities than heretofore he must meet them by mastering his business and attending to it. This means more thorough training. If as a profession we are to succeed in effecting such further official organisation as will protect both the public and ourselves from the depredations of poachers, the foundation-stone of that organisation must be systematic professional training, and it is, and will always be, one of the most responsible duties of the Institute to see that that training is really efficient, and its standard steadily maintained. In saying this I do not for one moment imply that our present methods of training are not efficient. They are efficient, whenever they are properly applied. The mischief is that they are not universally applied, or, to put it another way, that they are not insisted on in the case of all who set out to practise architecture. The strength of a chain is its weakest link, and however strong a profession may be in individuals it is the minimum of excellence that determines its position with the public. Thus it is that, by insistence on this training, with its corollary of a widespread level of accomplishment, we may hope to build up in the mind of the public a real understanding of architecture. I fear that, until that is done, we shall continue to suffer from the unfortunate vicissitudes of art in this country, those failures of method and intelligence which result in constant disappointments, only relieved at rare intervals by some effort of individual genius or patriotism. I will not dwell here on the alarming architectural results that may arise from the bureaucratic instinct, that growing centripetal tendency in our State and municipal departments which deprives the public of the use of the best ability in the country and so far hinders it from getting the best value for its money. Nor need I enlarge on such matters as the lack of organised protection for our national monuments. A Bill for their protection is now being considered by a Committee of both Houses, and you will have fresh in your memory an astonishing piece of vandalism which was only rectified at the last moment through the munificence of a distinguished statesman. Mistakes which are afterwards a source of the keenest regret seem to slip through by accident. In those far-distant days, when real ability and solid attainment will be the condition precedent to the practice of architecture, one may hope to see these evils remedied, because a sense of the place and value of architecture will be widespread among educated people. The serious importance of this art in the State will be realised, and with this keener sense of the gravity of the problems of architecture fuller trust will be given to those whose high calling it is to practise the art.

Lastly—and this time it really is lastly—there is the relation of the architect to himself. So far I have been discussing his position in regard to the public. But more important than this is his own attitude to his career, the point of view from which he regards the work of his life. There is a real danger, in all this whirl of architectural politics, of our forgetting that first of all we are artists, and that the art which we practise is a very great and a very old one. The cares of business, the keenness of competition, the feverish haste of modern work, are apt to reduce the lamp of art to the merest flicker if they do not put it out altogether. Those of us who have wide experience of practice

know how difficult it is to keep that lamp alight, but here I am addressing myself not to my seniors and contemporaries, but to our younger members: to those who will take our places and carry on our work. Scholarship and research have always been among the best traditions of this Institute. I need only recall such names as Donaldson, Cockerell, and Penrose, and remind you that whatever view one may take of the historical justness of the Gothic Revival, there can be no question of the intense enthusiasm that inspired the labours of such men as the younger Pugin, Street, Burges, and Nesfield. If you turn over the pages of the earlier volumes of our "Transactions" you will find papers on matters of serious interest, marked by a learning and ability that give them a permanent value in architectural literature. I hope, and I do not doubt, that that tradition will be worthily maintained by the rising generation. Current politics may be fascinating, but they are the outside of the cup and platter; they are a very poor substitute for that patient forging and perfecting of your artistic armament which will enable you later to practise your art with the enjoyment that comes of real mastery. And to those that have enthusiasm this labour will be a perennial delight, the joy that is to be won from the study of past art. Who of us, after all, does not look back with vivid pleasure to those wrestlings with the mysteries of some great cathedral, quiet hours with pencil, note-book, and two-foot rule spent in some exquisite chapter-house, long autumn rambles among the time-worn buildings of historic cities? These things are the privilege of the architectural student, and it is this touch with the past that gives to our work its abiding interest. You may recollect the old Greek game of the Lampadephoria, where runners took torches lit at the altars of Prometheus, Athene, and Hephaistos, and passed them from hand to hand till they reached the winning post. That, gentlemen, is our position. It is our business to hand on the torch of architecture. Some of us may be getting old and stiff in the joints, and may have to content ourselves with painfully nursing the flame. It is for you of the younger generation so to train yourselves in your calling that, when the torch is passed into your hands, you may fan it to more vigorous life, and enable it to shine again with all the splendid brilliancy of the great ages of architecture.

Lord Plymouth said it was his privilege to move a very hearty vote of thanks to the President for the very interesting and able address which he had just delivered on the opening of the seventy-eighth session of the Royal Institute. The President had made a most interesting survey of the present position of the Institute and of the general future policy, both from its administrative and educational sides. Those were matters which he had no claim to criticise, even if he desired to do so. Perhaps there was one matter which he might refer to, and it was a matter which came more vividly to one's mind by looking round the walls of that room and seeing the drawings there displayed, and it was as to the very large part played by ancient buildings and ancient monuments in the architectural interest of their surroundings. The President had reminded them that the Government had introduced a Bill into Parliament with the intention of dealing with the preservation of ancient monuments. The Committee was now sitting, and had not yet reported. But he would like to recall to those present that evening one or two great difficulties which confronted that Committee in dealing with this question, and he would make an appeal to the Institute with regard to it. There were two extremes which confront the Government. One he might describe as the method hitherto practised in this country, viz., leaving alone those responsible for ancient buildings and monuments (whether as trustees of more or less public buildings, or whether they be private owners), with the hope and confidence that they are alive to their responsibilities and will do their best to keep them in a proper state of preservation. Although there are existing by-laws dealing with the preservation of our ancient monuments, they exercise so very limited a control that it may fairly be said that we in this country go to the extreme of leaving the question alone. On the other hand, they were constantly having quoted to them the practice of other nations; but he very much doubted whether the powers there conferred had been so very successful in the treatment of ancient buildings in large European countries. At any rate, they in this country might profit by that experience, while not hurriedly adopting organisations which they might find not only did not suit them here, but had not been completely successful in those countries where they have been practised. The nation, he ventured to hope and believe, were approaching this question with care, and the Committee

were making a great endeavour to constitute some organisation which will in the first place assist those who have the responsibility and care of ancient monuments in getting expert advice in dealing with those buildings. One of the greatest difficulties of all was to set up any advisory board which would have the complete confidence of the country, and whose advice and final decision will carry with it the general consensus of those interested in these buildings. It was in connection with that matter that he would like to make an appeal to the Institute. After all, though there are representatives of archaeological societies who might well belong to such an advisory board, it was to the architects who had studied the construction and various methods of building, ancient and modern, to whom they would have finally to turn for the preservation of ancient monuments. It would, he thought, be agreed that taste and knowledge had changed in the architectural profession more quickly because those in it had studied the question more deeply; but taste had changed throughout the whole country in the last half-century. Previous to that time some eminent architects had more interest in the construction and what they thought was the permanent stability of a building than reverence for the ancient stones. But undoubtedly things had changed very much; there existed a general feeling among the public that now they have a duty to perform, and that it was necessary to take all the steps they could towards the preservation of those ancient buildings. It was to the Royal Institute of British Architects, as the leading architectural body, that they must turn for architectural advice. Personally he had not only paid a great deal of attention to the subject for some time past, but he had been engaged just lately in some Parliamentary Committee work in regard to it. He could only venture to say that, so far as he could see, they were proceeding with great care and great caution, and were prepared to turn to those whose training and experience has given them the right to the final word how such ancient monuments and buildings should be treated.

Sir Aston Webb, R.A., in seconding the vote of thanks, said they were all delighted to see Mr. Blomfield in the chair, and while they congratulated him they also congratulated themselves on having got him. They knew him as an architect of distinction, an architect who had great literary gifts and had written on English and French Renaissance, and one who had taken also a very high University degree. Mr. Blomfield had another side to his character, viz., that he was a good all-round sportsman. When the Royal Academy students have their annual cricket match at Lords their first desire is to have Mr. Blomfield to play; indeed, he secured once over a hundred runs for them. He was also an excellent rider to hounds and a fine lawn-tennis player. In a word, he was an excellent all-round man. It was commonly asserted that the practice of architect produced one-sided men. The charge was refuted in Mr. Blomfield, who was, he might say, a polygonal President. They were glad to see him there for another reason. Mr. Blomfield could be looked upon as a symbol of reconciliation among the members. They of the Institute might feel inclined to say, "This my son was dead, and is alive again." Now they had got him they intended to keep him and to make the most of him. It was a strange nemesis that the first thing that their President had to do was to form some scheme of registration. But they were united now, and he believed there was a determination among the members of the Institute, whether they believed in it or not (and he for one did not do so) to see whether by putting their heads together honestly and sincerely they could not draw up some scheme. They would then submit it as a means of stopping that long business which has been going on for years and years, and of which they were all getting sick. They would like to see the Institute undertaking matters more advantageous to architecture and to their members. Mr. Blomfield probably looked upon education as the thing with which he was most largely concerned. They knew that he largely helped in preparing the scheme of education now in process of adoption, and he had also just adumbrated the possibility of some advanced training, which might take the form of a diploma course. Everyone would hope that something might be done in the matter. Mention had been made of the Royal Academy; he (Sir Aston) might say, although he possessed no authority to make any announcement, that he knew enough to promise that the Royal Academy would give a sympathetic hearing to any proposal. Indeed, the Academy were far more ready than was generally supposed to listen to such schemes. Part of the work of the Royal Institute was the care of those gentlemen who had fallen in the race.

He might mention that the Architects' Benevolent Society would be extremely glad to have new subscriptions. Another important feature of their work was education. Here they were full of hope that they would have in the future a better-trained body of architects than in the past. No great buildings would be designed unless there grew up men who would help one another. He seconded very gladly the vote of thanks.

The vote was then carried by acclamation.

Mr. Reginald Blomfield briefly acknowledged the vote of thanks. In conclusion, he drew attention to the most remarkable collection of drawings by Bibieni and others hung round on the walls, which had been presented to the Institute through Sir Charles Barry by Sir J. Drummond Stewart in 1838.

The next meeting of the Institute will be held on Monday, November 18, when Mr. J. L. Ball will read a paper on "Bath and Wells."

SMALL HOUSES IN EAST ANGLIA.

CLUB HOUSE FOR DOVERCOURT SPORTS CLUB, LTD.—This building has been recently erected upon the grounds of the Dovercourt Sports Club, which has an area of about two acres in a charming position directly facing the sea, of which an excellent view is obtained from the windows and loggia. The accommodation consists of a large entrance hall, with bar attached and cellar under, with servery to dining-room, and lounge and reading-room, which has a beamed ceiling and fine Elizabethan fireplace and open grate built in 2-inch red bricks; a fine billiard-room, ladies' and gentlemen's dressing-rooms, bath-room, shower bath and lavatories, smoke-room, &c., with kitchen, pantries, &c., for steward. The exterior is finished in cream rough-cast plaster, woodwork dark oak, and roof covered in dark-red sand-faced tiles and tile hanging. The building has been well carried out by Messrs. Blay, Ltd., of Dartford and London, the furnishing by Messrs. Frasers, Ltd., of Ipswich, and the whole from the designs and under the superintendence of Mr. H. Steward Watling, architect.

MANOR CLOSE, LOWESTOFT.—This house is about to be erected at Lowestoft, and faces almost due south, giving a charming aspect from the verandah. The plan is somewhat unique, being of an L shape with an octagonal entrance hall, panelled with oak, from which the staircase is recessed in an alcove. There is also a fine general sitting-room some 25 feet in length, and other rooms in proportion, the whole of the woodwork of which is of oak. The exterior is finished in cream rough-cast plaster above the antique red-brick plinth, the chimneys being built to match. The timber work is of rough-surfaced oak, with oak piers projecting, and the gables and roof covered with dark-red sand-faced tiles. The oak throughout is oiled and finished antique, the garden being laid out in keeping with the general style of the building. The contract has been secured by Mr. Styles, and the plans have been prepared by Mr. H. Steward Watling, under whose superintendence the work is to be carried out.

THE BUNGALOW, IPSWICH.—This bungalow, now in course of erection by Mr. F. Read, builder, Ipswich, is from the designs of Mr. H. Steward Watling, architect.

THE CROFT, LOWESTOFT.—This detached residence has been recently completed by Messrs. A. G. Beckett & Son, of Oulton Broad, under the superintendence of Mr. H. Steward Watling, architect.

THE GABLES, OULTON BROAD.—This residence and buildings have just been completed by Mr. E. Neech, of Oulton, from designs by Mr. H. Steward Watling, architect.

HOUSE, GREAT FRONKS ESTATE, DOVERCOURT.—This house, being the first of forty houses to be erected on this estate, is in course of completion by Mr. Edw. Saunders, builder, Dovercourt, from designs by the estate architect, Mr. H. Steward Watling.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE have received only a few drawings of bay and oriel windows, which are features which ought to be well and carefully studied, as there is scarcely a small modern house in which one or the other is not introduced. The old examples have a charm whose secret can only be discovered, whose feeling can only be imbibed by the careful study imposed by measurement.

"Alpha" has measured a semi-octagonal two-storeyed stone bay from Welton Hall, Northumberland, an example of good proportion and simple, unaffected treatment of entirely satisfactory character. The drawing is well done and workmanlike.

"Owain" gives us a carefully measured and decently

HOUSE OF HANOVER—THE GEORGIAN ERA.

(Concluded from last week.)

HAREWOOD HOUSE, Yorkshire, was in course of erection in 1760 from designs of John Carr of York; Holkham was practically completed the following year, when Kedleston, Derbyshire, occupied the attention of Robert Adam, who commenced Lansdowne House some four years later.

Meanwhile Sir William Chambers was actively employed at Kew Gardens erecting pagodas and temples to adorn the grounds. Chambers's earlier works include Pembroke House, Whitehall Gardens, which is now threatened with demolition. The accompanying views show a chimney-

KENT'S CHIMNEYPiece, PEMBROKE HOUSE.

drawn study of a circular bay window from Kirby Hall, with its interesting Gothic lines and Renaissance detail.

"Avec beaucoup de peur" has selected an earlier example in the richly wrought bay window in the Deanery, Wells. The drawing, though sufficiently workmanlike, is a little confused by economy of paper.

"Chelt" sends the only example of an oriel, and that in brick, from the Rye House, Hoddesdon, Hertfordshire, which is both interesting and charming, and is well drawn by our contributor.

We award prizes of half a guinea each to "Alpha," "Owain," "Avec beaucoup de peur" and "Chelt."

piece by Kent, who formerly executed some work here, in a room now occupied by the President of the Board of Trade. The ante-room on the first floor has an elegant decorative theme for so small a room, which is to be seen in the second view of the staircase.

Carrington House, which formerly stood on the site now occupied by the new War Office building, was an exceedingly tastefully designed house, especially as regards the interior. Chambers' design for the ball-room exists in the collection of his drawings at the Soane Museum. The room has an alcove at the end, and the walls are panelled with large and small panels, the latter having a plaster or carton pierre treatment in his favourite man-

ner. The difference between the work of Chambers and Adam is very distinct, although contemporaneous, the ornament of the former's examples being of a more varied and studied character, with just sufficient relief to make it bolder, more sympathetic to the theme, and thereby vastly more interesting. This is particularly noticeable in the detail of the ante-room at Pembroke House, the design of which shows obvious study of French principles on the wall side, while the window side has an English traditional basis in the design of the long sculptured panels and the ornament to the mullions.

Robert and James Adam were the most important decorators of this period. The life of the family has been ably traced by Mr. John Swarbrick, A.R.I.B.A., in his prize

to obtain the rich effect which his productions certainly give. His greatest faults lie in the repetition of meretricious ornament, absence of colour, and a leaning towards too delicate an execution of his designs. When he secured the assistance of Antonio Zucchi and Angelica Kauffmann, the effect of his interiors was very much enhanced by the contrast of the paintings with the plaster decorations. This was just what his style chiefly lacked, and the combination proved eminently successful. The Brothers Adam published a series of their designs, but the majority of their original sketches were made into 55 volumes, which were bought by Sir John Soane, and are now in the Museum of that name in Lincoln's Inn Fields.

The scheme of decoration adopted in the drawing-room

essay of the Architectural Association for 1903, published in their "Journal" for that year. The "Adam" vogue was of almost unlimited extent to the exclusion of many of their compeers; they readily fell in with the demands of their day, designing in various styles: Moorish, Gothic, Chinese, and more especially their own peculiar invention associated with their name, which has been termed the "English Empire" style. Robert Adam, as the principal inventor of the style, infused his brothers and assistants with an enthusiasm for producing like work, the character of which exhibits a love of detail of a refined nature based upon his foreign studies and adapted to the modern requirements. He avoided the heavy cornices and bold projection of the work of his predecessors, placing his faith on the slight projections of bas-relief, using pilasters preferably to columns where possible, and relying on his ornament

at Stoke Edith has already been referred to. The walls were designed with panels grouped together at intervals, the central one in each bay being decorated with an oval containing a Greek tripod with griffins' heads. The border of the ceiling is ornamented with a design of laurel leaves in geometrical scrolls, and other ornaments are adapted to the frieze and panels. The general effect is somewhat restless and disconnected. There are all the attributes of good design, an harmonious scheme with rectangular treatment, but it is spoiled by puerile and meaningless detail. The description of this room fully typifies other examples, although Adam frequently exhibited much originality and variety in the planning of additions to the larger residences upon which he was engaged. This work was executed about 1771, two years after which date the brothers commenced the publication of their "Works on Architecture," which came out

periodically, and one of their draughtsmen, G. Richardson, brought out a "Book of Ceilings" in 1776, based on the same principles. A year later M. A. Pergolesi published his "Designs," containing friezes, cornices, &c., similar to P. Columbani's "Book of Ornament," which preceded it.

Robert Adam was engaged on his decorations to Newby Hall for Mr. William Weddell in 1772, when he built the additional wings, including the triple sculpture gallery, which, being based on a Roman model with little decoration except to the arches and alcoves, is highly successful for the purpose for which it is intended. In the drawing-room are exceedingly fine Gobelins tapestries of eighteenth-century workmanship, making a good composition, although the ceiling treatment is cold and hard in design, redeemed by some tasteful paintings by Antonio Zucchi. The library walls are decorated with arabesque panels similar to those at Stoke

supervision in connection with these decorations, although the *hand* is obvious.

The ceiling of the drawing-room at Broome Park is in the Adam manner, but the eighteenth-century alterations were carried out under the direction of James Wyatt in 1778, after he had transformed the Pantheon, Oxford Street, and prior to his "fall," when he acquired mediæval predilections. Sir Henry Oxenden confined Wyatt chiefly to the entrance hall and drawing-room, the former being rather bald in its absence of decoration. The ceiling is plain; Tuscan columns support beams flanking the central area, the windows being altered to sashes. There is an apology for a cornice, the most decorative feature being the light stone paving, which is worked in geometrical patterns with darker bands.

Claydon House, Buckinghamshire, parts of which are illustrated by the accompanying photographs, has already

STAIRCASE, PEMBROKE HOUSE.

Edith; the chimneypiece is a good design, which, with the painted panel above it, forms an interesting feature in the room.

In their designs for chimneypieces the Brothers Adam excelled, and more especially in the metal interiors. There are numerous examples of their work, notably at Barnsley Park and Kirklees Park in Yorkshire, which latter was being decorated for Sir George Armytage about the time Robert Adam was engaged on his extensive work at Harewood House, to which Sir Charles Barry made additions in the following century. Mr. Tipping has unearthed the names of two people connected with the decorations at Kirklees Park—namely, that of "Mr. Lindley" for plans of a new room, for which he received six guineas in 1777, and "Mr. Bertram," who obtained the sum of £37 6s. "for carving in the Great room," there being no definite record of Adam

been alluded to in a previous article. It remains to describe the work of Chippendale and Adam. The house was made a subject of importance in *Country Life* for March 1912 by Mr. Lawrence Weaver, who there traces the lineal descendants of the Verney family. The chief decorations are of eighteenth-century origin, presenting as a whole an overwhelming sumptuousness having some historical interest in indicating the florid tastes of the time. Here may be seen actual examples of the influence of Edwards and Darly's book on "Chinese Designs," published in 1754—inlaid doors and an elaborate staircase, with inlaid treads and risers ornamented with mother-of-pearl; doors of French influence; a modernised Gothic decoration said to be the early work of Adam. Mr. Weaver's research has, however, brought to light the name of an Italian plasterer, one Patroli, who worked there for some considerable time, perhaps under

Adam's direction. The quieter work of Adam is to be seen on the walls of the staircase, of which the handrailing is a very fine specimen of wrought-iron work. Of the fireplaces that in the library is the most tasteful, while the north hall, Gothic room and saloon contain others with more elaborate carving than our modern ideas of refinement allow. The ceilings vary in a similar way, and have as much excess of freedom in their design and execution. There are fine features, taken individually, in many of the rooms—oak door frames of the library and the pedimented doorways of the saloon

two talented artists. Maria Anna Angelica Kauffmann was born in 1741 at Coire, Grisons. Her family migrated to various towns, as Como, Milan, Schwarzenberg, and subsequently to Rome in 1763, where she made the acquaintance of Winckelmann. She studied the paintings of Titian, Tintoretto and Veronese at Venice, and came to England in 1766 with Lady Wentworth, living with her father in Golden Square, where she executed many portraits of the nobility. Her decorations include the Flower-room at Frogmore for the Queen; the ceiling of the Council Chamber at Burlington

AT SHEEN HOUSE, RICHMOND.

being cases in point—but one hesitates to estimate the value from an art standpoint of the majority of the decorations which glare out from every corner. The whole house suggests that the owner was of an arbitrary nature, in possession of little taste, which resulted in the employment of artists of entirely opposed calibre.

The marriage of Angelica Kauffmann to Antonio Zucchi in 1781 calls for some remark as to the part played by these

House; decorations for Lord Londonderry in Ireland, and many like works, apart from the extensive amount of painting she did for the Brothers Adam. Her personality must have been of a very charming nature to have received the attentions of Garrick, Goldsmith, Fuseli, Nathaniel Dance and Sir Joshua Reynolds. After her marriage she went with her husband to Rome, where she died in 1807.

Angelica Kauffmann favoured the French "red-chalk

manner of engraving" introduced by Francesco Bartolozzi (1727-1815). He was a great friend of Cipriani's, with whom he lodged in Warwick Street, Golden Square, having come to England in 1764 at the request of Mr. Dalton, librarian to George III. J. B. Cipriani produced his "Book of Ornament" in 1786; he was an excellent draughtsman, executing many designs for the Brothers Adam. In 1782 Joseph Rose, junr., published a book containing "330 Designs for Friezes, &c.," from the designs of the Brothers Adam, Wyatt, and Stuart, which gives a very good idea of the class of work carried out at this time.

An early instance of stencil work and decorative painting exists at Sheen House, Richmond, executed about 1785, illustrated by the accompanying photograph. Very little stencil work was done until the advent of Alfred Stevens towards the middle of the nineteenth century, examples of whose work exists in the collection at the Victoria and Albert Museum. In this museum may be seen some very fine inlaid chimneypieces made by Peter Bossi, the sculptor, from Dublin, who practised there during the last quarter of the eighteenth century.

The interior of Dover House, Whitehall, 1786, presents

work to realise its suitability to the character of the decorations of the later Georgian era, and even with work of the nature of that adopted by Chambers with which it is eminently harmonious.

Upon the work of Sir John Soane we do not need to dwell at any length, since a review by the writer appeared in this journal in October 1911. The influence of his work, which has hitherto been somewhat overlooked, is now being more fully appreciated, as no doubt his valuable library will be during the present era of Greek revival. The danger of this movement lies chiefly in the possibility of losing the spirit of the work, which originally depended for effect as much upon colour as form. If the colour be omitted the form becomes merely a hard repetition of characteristic detail, and without freedom of execution combined with originality of design this movement is doomed to a premature burial, a revival of the advanced Empire style of Thomas Hope being the incipient resultant, and one cannot do better than quote a voice from the past upon this very point in the words of C. J. Richardson: "The English school, as left to us by Wren and his pupils, gave us a style admirably adapted to our wants; and if, instead of correcting the heavy contentious ornament belonging to it, through the medium of the puerile

CAPITAL IN WALNUT WOOD.—DESIGNED BY ALFRED STEVENS, EXECUTED BY DAYMOND & SONS.

an entirely different class of decoration from the contemporary work. Henry Holland was an architect who based his work upon sound principles of construction. He was born in 1746, and had an extensive practice, executing Carlton House, Pall Mall, for George, Prince of Wales (afterwards George IV.), which was pulled down in 1827. His Dover House work constituted additions to Paine's building. In a similar way he made alterations to Wyatt's work at the Pantheon, Oxford Street, the portico of which is a subsequent addition by Smirke. Portions of Althorpe Hall, Northamptonshire, are from designs of Holland, who imparted to Sir John Soane some of his early education.

The age of Heppelwhite, Shearer and Sheraton was ushered in by the publication of several books on cabinet work, upholstery, &c., wherein they do not hesitate to point out the sins of omission of their predecessors in the trade.

With all the boasted refinements and grandeur they professed to introduce, the age of Chippendale has yet to repeat its history, and will be recognised ere long as the period when the art of the joiner was most successful and promised the best æsthetic results. Delicacy and refinement is not necessarily the most practical form of treating an object which has to suffer considerable wear and tear. One has only to examine a few examples of the best Chippendale

pencils of the Adams, we had applied the pure principles of Grecian art and Grecian taste (the true source of all correctness and beauty), the style of that period gave promise of equalling the best productions of foreign schools, and of being surpassed by none."

Cockerell is, perhaps, the only English architect who interpreted the Greek spirit within the meaning of the above expression, but since a description of his work would necessitate reviewing the work of the nineteenth century we must leave this for a later opportunity, when we have space to deal adequately with the subject of the work of Sir Charles Barry, Goldicutt, and Alfred Stevens. The period was somewhat barren and devoid of a high standard of taste in the intervening years, and the shining lights of genius very few. Stevens started a new school of thought and design, having, unfortunately, too few followers to carry on the good work he began.

In conclusion, I have to express my indebtedness to Mr. Lawrence Turner for the loan of several useful photographs illustrating some Jacobean and Georgian examples; to Mr. Walter Spiers for the photographs of Chiswick House and Pembroke House; to Mr. Lawrence Weaver for information about Claydon House, and to Mr. Goodison for permitting me to see photographs in his possession of Carrington House.

FRENCH RENAISSANCE ARCHITECTURE.—IV.

IS the third of the ten public lectures dealing with French Renaissance Architecture, now being delivered on Thursday evenings at University College, Gower Street, W.C., Mr. W. H. Ward, M.A., A.R.I.B.A., had dealt particularly with Church Architecture under Francis I. and the beginnings of the Advanced Renaissance. He showed how the influence of the early Renaissance of Northern Italy introduced by the colony of Amboise or Loire school was beginning to wane before that of the Roman Renaissance, propagated on the one hand by the new colony of artists engaged by the King to embellish Fontainebleau, and on the other by a number of young Frenchmen, some of whom had learnt the new manner in the course of their travels in Italy, and especially in Rome.

In his fourth lecture Mr. Ward dealt with "The Louvre and Advanced Renaissance, or Style of Henry II." The latter style was, as previously pointed out, well established before the death of Henry's father. One of the last acts of Francis I. was to set about rebuilding, at least in part, the feudal Louvre. He selected in 1546 as architect the Frenchman Pierre Lescot, whose style was of the advanced Renaissance; and for the first time an artist was accorded complete administrative control of building operations. In all the four known works of this architect Jean Goujon worked as a sculptor. At the Louvre, Pierre Lescot was genuinely the architect and responsible for the general design, but he acted in consultation with Goujon, who doubtless exercised considerable influence on him. Mr. Ward would not accept the view that Goujon was the real architect of the Louvre, and Lescot merely a figurehead.

When Henry II. came to the throne the most celebrated example of the Advanced Renaissance in France had thus already been begun. One of the most important departures from tradition at the Louvre was the fact that the design was conceived as a whole from the first, and set out not only with symmetry and regularity, but in such a manner that it would produce a broad and dignified effect by the grouping and proportion of its masses and storeys. The decoration was bolder and confined to carefully selected portions. The most striking characteristic lies in the treatment of the Orders, which are detailed and proportioned, applied and combined, in accordance with the rules deduced by the Italians from ancient monuments and the writings of Vitruvius. All the mouldings and enrichments are cut with a crispness, sharpness, and delicacy which is hardly found at any other period. A few less important buildings which exhibit similar characteristics were mentioned by Mr. Ward, such as the Hôtel Cabu at Orleans, the Château of Bournazel, and Hôtel d'Assezat at Toulouse.

In the diminishing church architecture the fashion principally showed itself in individual features as the door of St. Nicholas at Troyes (c. 1555) and the south-west tower at Gisors.

In the Louvre a rare distinction and an almost feminine grace and delicacy are amongst the most striking characteristics. But simultaneously with them were rising other buildings, principally works of the School of Fontainebleau, in which there is less delicacy but greater boldness. An example of these is the east wing of the Fountain Court of Fontainebleau, possibly a work of Serlio, but more probably of Primaticcio. It is remarkable for its symmetrical massing, bold rustication, and majestically conceived flights of steps. Another example is the Château of Monceaux-en-Brie, which, according to Mr. Ward, was probably begun in 1547 for Catherine de Medici from the plans of Primaticcio. Here was introduced for the first time in France a giant order.

Soon liberties began to be taken with classical design, and the purer traditions of Bramante and Raphael were forsaken for the freer practice of Michel Angelo. Both Il Rosso and Primaticcio at Fontainebleau gave free reign to their fancy in decoration and employed the most fantastic devices, particularly the free use of the human figure, for architectural functions, together with a lavish use of scrolls, wreaths and swags, and especially of the cartouche. Among the contemporary French architects there was the same discontent with the simpler classic forms used in their logical application. Among these was Jacques Androuet du Cerceau, whose published designs show the gradual development between 1533 and 1584. Somewhat similar motives inspired Philibert de l'Orme and Jean Bullant. The first-named on the death of Francis I. was appointed architect and inspector-in-chief of all the royal buildings, with the exception of the Louvre. One of the most important of his innumerable works was the rebuilding of the Château of Anet (1548-

1554); it suffers considerably from over-elaboration and fuss. On the death of Henry II. in 1559 de l'Orme was dismissed in favour of Primaticcio, the Queen Mother's favourite. Within three years, however, Catherine employed de l'Orme to prepare a scheme for her new Palace of the Tuileries. Here he exhibits his usual characteristics, but as regards the plan there is an advance on Anet. On his death in 1570 the palace was continued by Bullant, a man whose work is very various and difficult to estimate.

In the thirty troublous years after Henry II. met his death in a tournament in 1559 France fell into a state of ever-increasing anarchy and demoralisation, and building became more difficult and new edifices rarer. Those erected often show a love for bizarre and contorted forms and for overloaded ornament. Rustication also begins to be lavishly used, and the tendency to enhanced scale increases. Prominent in this period were the remarkable architectural family of Androuet du Cerceau.

POST-IMPRESSIONISTS AT THE GRAFTON GALLERIES.

"AND they said one to another, It is manna, for they wist not what it was." A fitting text to any review of this, the second of these Exhibitions (apt word!). The first one was held two years ago, and is doubtless remembered by all those who attended it. Indeed, who could forget such work as is presented here to the eyes of an unadmiring public? For let it be ever understood that the general public (always more or less sane) has but laughter (at the worst) and scorn (at the best) for such a medley as the Grafton Galleries are now displaying, though mercifully closing their doors ere a New Year dawns.

In the course of some unconsciously-apologetic praises by the several preface-writers of the English, French, and Russian groups, the English apologetic laudator, Mr. Clive Bell, remarks that "New wine abounded, and the old bottles were found wanting." Ay, truly! and the sooner this new wine is corked up in new bottles and stowed away in old or new cellars the better. And what in the name of Art does Mr. Bell mean by this? "It is possible to contemplate emotionally a coal-scuttle as the friend of man. We can consider it in relation to the toes of the family circle and the paws of the watch-dog." Further on he merits and receives our grateful assent. "Looking at these pictures, every visitor will be struck by the fact that they are neither pieces of handsome furniture, nor pretty knick-knacks, nor tasteful souvenirs," and he adds, "They are intended neither to please, to flatter, nor to shock"; but, Heaven help us! even if not so intended they certainly *do* shock us. Mr. Roger Fry in his Preface remarks that these artists "do not seek to imitate form, but to create form; not to imitate life, but to find an equivalent for life. . . . They aim not at illusion, but at reality"—and they signally fail in their aspirations.

But enough of the preface-writers; let us prepare to deal with some of the works presented to our sight. It would seem to be a radical idea of all post-impressionists to disregard form, drawing, proportion, harmonious colour, values and poetic conception amongst other recognised qualities of Art, whose requirements such men as Murillo, Rubens, Reynolds, and an innumerable host studied to satisfy. We know that beauty is but of the surface, and not always then apparent; but, except in historical works or specific portraits, surely an interesting face and a pleasing figure are desiderata. However, the post-impressionists deny this in practice, for never (or hardly ever) one or the other is portrayed. Leighton glorified (as he was justified in doing) the grace, the beauty of the nude; alas! the post-impressionists give us the nude denuded of all grace, all beauty, all life! Regard, par exemple, M. Henri Matisse's "La pose du nu," where, however, we gratefully recognise a good scheme of light and shade. Let us dispose of this practitioner's work at once. "Les capucins" recalls to our memory the title of a quarter-century old song, "You should see me dance the polka" (only we would prefer to close our eyes on the vision), just as "La coiffeuse" suggests the song "Two lovely black eyes"; and with all diffidence we ask—"Would not the lady have done better to have donned, if only a chemise or even a chemisette, before subjecting herself to the labours of the hairdresser? If we desire to regard M. Matisse in his glory, let us observe (but only for a second) "Conversation." Here is a large, a monstrously large, canvas with two profile figures—man in pyjamas, with hand in pocket, facing seated woman, whose facial profile has almost disappeared; there is also a balcony and a garden—such a balcony and

such a garden! "La luxé" shows three women (of course, nude) post-impressionally posed and drawn. "Jeune Marin" has emerald knickers, and as there was some of the colour left on the palette M. "Wemmick" Matisse said to himself: "Ma foi! Here is some emerald green over; let's use it for the eyes, the eye-brows, and—yes! there is just enough left for the upper lip." He exhibits one passable pen-and-ink sketch, and in his "Les danseuses," ghastly as it is, we recognise the search after flow of line and the desire to express legitimate emotion. We must finally draw attention to his plaster figure of "L'Araignée" for its sinuosity, which does not suggest a spider, and for its unreality, which does not suggest a woman. Au revoir, cher M. Matisse!

In this Exhibition we realise how much the jig-saw craze has influenced certain post-impressionists. In some cases the artists (we shiver when so designating them) have more or less successfully solved the puzzle, whilst elsewhere they have tired after a time, and in some instances have, ab initio, fitted the sections in anyhow nohow, so long as a rectangular block was obtained. Signor Pablo Picasso and Mr. Wyndham Lewis are the two chief sinners in this line; the former in his "Tête de femme" (No. 64), "Tête d'homme" (which is mad), "Buffalo Bill" (which is madder), and "La femme au pot de moutarde." In comparison, his portrait of "Mademoiselle L. B." is presentable. And what does Mr. Lewis give us? There is his "Mother and Child," which is jig-saw rampagous. Shut the eyes—quick!—And keep them shut! In "Creation" more appropriately are the sections coming together deliberately, but they have not yet assumed their proper positions altogether (and that is wording it mildly). Mr. Lewis also shows some drawings for a masque of "Timon of Athens"; in No. 201 the effect is as though he muttered to himself, "There's not one piece in its right place; what shall I do?"

M. André L'Hôte's "Tête de Nègre" is very passable, if we reflect that "In the land of the blind the one-eyed are kings." M. Henri Rousseau's "Scène de Forêt" shows the reddest, the hardest, the most unattractive sun ever presented to the vision, and the vegetation is as hard as a bar of cast iron, and quite as unbeautiful. M. Marchand's "Vue de Ville" is a design in Richter's anchor building blocks for children. Why not? Is not a large proportion of the exhibits apparently the daubing of juveniles? M. Chabaud's "Chemin dans la Montagne" presents us with a couple of lines of seemingly Bourse news-tape along the road, with never a soul in sight to read off the latest prices of stocks and shares: "Le troupeau sort après la pluie" is awful; and carefully note that the various curious objects shown are trees, not branched candlesticks.

In Mynheer van Dongen's portrait of his wife we observe the first clever work, our principal objection being to the green shades on the flesh; but the work is brilliantly clever, the pose striking, the face attractive and well modelled, and though veiled behind dark lashes, yet the eyes are suggestively bright behind the veil. The artist has been less successful in other works. Bearing in mind "the land of the blind," M. Flandrin's "Canal à Venise" and "Basilique Romaine" are passable. Mr. Henry Lamb's portrait of Mr. Lytton Strachey is probably a good likeness, though not a work of art. Mr. Gore's "Letchworth Station" has most exaggerated figures on the platform. Mlle. Vera Joukoff's "Portrait of an Old Woman" is as hard and uncompromising as nails; and M. Eugène Zak's "Le Berger" shows a shepherd oblivious of his flock (of three sheep) in the far distance; he would seem to have hurt his hand, and we are shown the enormous drops of blood that are floating on the surface of the water.

But is it not all vanity and vexation of spirit? No! Not the latter, apparently, for laughter is perforce drawn forth, and at times we missed the presence of a companion who would laugh with us. More often we missed her gentle influence to soften the maledictions with which we were fain to maledict the desecrated altars of painting and sculpture.

ARCHITECT'S RIGHT TO ORDER GOODS.

As important point respecting the right of an architect to pledge the credit of a builder was argued in the Court of Appeal before Lords Justices Vaughan Williams, Buckley and Kennedy on Monday, November 4. There were cross appeals in the action of Ramsden & Carr, metal workers, Seymour Place, South Kensington, and Messrs. J. Chessum & Sons, builders, South Place, Finsbury, the question at issue being goods supplied in connection with the erection of a cinematograph theatre in 1910 at 225 Oxford Street.

The place was built by the defendants for a company which, counsel said, had since gone into liquidation. The plaintiffs supplied a quantity of hammered silver and brass door plates, artistic door handles, and other goods, which were ordered by the architect (Mr. M. S. Ward), and for which Ramsden & Carr contended the builders were responsible. The plaintiffs claimed £142 13s alternatively in respect of goods sold and delivered as money had and received by the defendants for the use of the plaintiffs, or as money held in trust for them. Chessum & Sons denied liability and repudiated the authority of the architect to pledge their credit. Mr. Justice Hamilton, in the Court below, held that the plaintiffs had failed to show that any money was received by the defendants from the company that should be allocated to the account for the goods, but that Ramsden & Carr succeeded in the issue as to goods sold and delivered. On that issue the learned Judge entered judgment for the plaintiffs with costs, the defendants getting costs on the issues on which the plaintiffs had not succeeded.

Mr. Ratcliffe, K.C., for Chessum & Sons, said the question was whether his clients or the building owners should pay.

In the course of the arguments Lord Justice Vaughan Williams said: It is plain there was a difficult question to be answered, and yet the plaintiffs asked for summary judgment without a trial. They say they believe there is no defence to the action. I can only say that is most improper, and if I were the Judge in Chambers and the summons came before me, I should not only dismiss the summons, but I should order the plaintiffs to pay the costs in any event, and I should see if I could not make the solicitors pay too.

Mr. Eames, for the respondents, said his clients knew nothing of the facts at that time as disclosed in Court now.

Mr. Ratcliffe said the architect ordered this metal work, or a great deal of it, purporting to act on behalf of the contracting builder. But the architect had no authority to do that. They were extras, and the contractor was not responsible for them. Under no circumstances could his clients be held responsible. The learned Judge below said "if Mr. Ward is not your agent, you have had these things, they have been fitted in your house, and that is an implied contract." The contractor was not bound to supply these goods, and the architect had no authority to order them. Certainly they were affixed by one of his clients' workmen, but that was by order of the architect.

Lord Justice Williams: Is Ward a party to the proceedings?

Mr. Eames, for Messrs. Ramsden & Carr, replied that he was not. He had not been served.

Lord Justice Buckley: Did Ward give evidence?

Mr. Eames: Yes.

Replying to the Court, Mr. Ratcliffe said the cost of the building was about £26,000. What the architect should have done was to tell the contractor what things were needed and ask him to obtain them.

Mr. Eames said the defendants had had these goods and made use of them. They took the benefit of them as though they were supplied under the contract. It was inferred the goods would be paid for by the appellants. His friend was wrong in suggesting that the architect had done something wrong. In the Court below the counsel for the defendants (Mr. Scott) formally admitted that they knew of the goods, that they were on the premises, that they were ordered by contract, and it was also admitted that they were goods treated as coming under the contract. The defendants also admitted that Ward had done nothing wrong, and the only ground on which the defendants objected to pay was that they had not been paid by the building owner.

When the case was resumed on Tuesday, November 5, Mr. Eames contended that there was an implied promise by the defendants to pay for the goods supplied, because they were accepted and used by them. There was authority under the contract for Mr. Ward to give the order. There was also good ground of action by the plaintiffs, because the defendants had received the money from the building owners.

Lord Justice Kennedy: I did not understand that the money had been received.

Mr. Eames said they received bills, which were treated as cash. If, said counsel, one took or accepted a negotiable instrument and the parties treated it as cash, that would render the giver liable for the amount. It could be treated as money had and received, although as a negotiable instrument it had never been met. He desired to correct a statement that had been made to the effect that at the time Mr. Ward gave the orders the Cinematograph Company was in financial difficulties. That statement must have been made

under a misapprehension, because so far as the first lot of goods was concerned most of the orders were given as early as April 1910, before either the architect or the builders had any idea or fear that financial difficulties would arise. The plaintiffs were not a business firm in the strict sense. They knew Mr. Ward, and had accepted his orders before on behalf of builders. The first invoice was certainly made out to Mr. Ward.

Lord Justice Williams: Is not that *prima facie* evidence that Mr. Ward is liable?

Mr. Eames said it was merely in the nature of a memorandum that the goods were supplied to the order of Mr. Ward, but it meant in reality that he was purchasing them on behalf of the defendants. He contended that the certificate given by Mr. Ward for £1,700 included the amount due to the plaintiffs. He submitted that Mr. Ward had authority to act as the agent of the defendants, and that they ratified and adopted his act.

Lord Justice Buckley: Will you argue that in the cross-appeal?

Mr. Eames said he had no desire to go over all the ground again, and he would prefer that the arguments he had used should be taken as what he would say in the cross-appeal. He would further submit that the defendants had received the money to which the plaintiffs were entitled.

On Wednesday, the 6th inst., the Court of Appeal delivered judgment.

Lord Justice Williams said there was no evidence that the architect had power to order goods either for the builders or the building owners. Neither was it proved that the contractors knew that the goods had been supplied, and that they were to be held liable for them. Agency had not been proved, nor had it been proved that any money had been paid by the building owners to the contractor for the benefit of the plaintiffs. The appeal of the defendants, therefore, would be allowed, and the cross appeal dismissed.

Lord Justice Buckley concurred.

Lord Justice Kennedy dissented. The defendants, said his Lordship, had accepted the goods and used them, and they were therefore liable. It was quite optional on their part. Had they liked they could have rejected the goods.

The Court, by a majority, allowed the defendants' appeal and dismissed the cross appeal.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Building Trade Prosperity.

SIR.—I was pleased to read your remarks in Notes and Comments quoting your Irish contemporary who stated that the building trade in Ireland is flourishing, particularly so in Dublin. Despite every possible difficulty the building trade seems to be improving also in England—to be able to return to the good old days when our manufacturing firms were complaining that they could not cope with their orders; when our leading builders hardly knew which way to turn, and on calling on leading architects the report was, "Quite unable to see you, even by appointment." What a desirable position! Is it coming again? Will England ever see it, and, if so, how long?

Apologising for trespassing on your space.—I am, &c.,
AN AGENT.

Fire! Fire!! Fire!!!

SIR,—The fire at the premises of Messrs. Barker, of Kensington, gives proof of the value of a fireproof constructed building with fireproof doors. But for such, a terrible fire would have resulted, with much greater loss of life. It is sad to think of the loss which has attended the fire, and it does not do to contemplate what might have been but for the efficient way in which walls and doors withstood the enormous heat. Might I be permitted through your columns to make a suggestion, which I have seen carried out with some effect: in the roof why not a large storage tank for rain water which could be used as a huge sprinkler in case of fire?—Your obedient servant,

A. N. S.

SIR,—When I take stock of the many big fires that our metropolis has witnessed during a period of but a few months, I am necessarily led to wonder where the main responsibility lies, not so much as regards the outbreak, but more with respect to the extent of the ravages. In these days of fireproof (!) materials, construction and details, how is it that, despite the several claims made for the superiority of one patent over all its predecessors and possible successors, the damage is so great and the death-roll so high? It seems to me that initially there should be a system of localising in construction, much in the same way that boats are now built with watertight compartments; and though we know that, even so, disasters may occur (as witness the *Titanic*), yet the chances of serious damage are minimised. If necessary, the L.C.C. should require (by legislation, to be obtained) smaller cubical dimensions to be enclosed by fire-resisting floors, walls and doors. I would go further and suggest that every lift-enclosure should be provided at each floor-level with a close-fitting, sliding, horizontal fire-resisting shutter, to be run into position and so maintained during all the hours when the premises are closed. We can never, I believe, eradicate chance dangers, but we should do everything possible to minimise them.—Faithfully yours,

PERCY L. MARKS.

Provincial Members and the Quantity Surveyors' Association

SIR.—It is about ten years since I wrote to the building papers suggesting the formation of an association of quantity surveyors. My proposal was energetically taken up by Mr. F. B. Hollis, of London, and the result was a meeting in London in March 1903, at which I took the chair and the present Q.S.A. was formed.

We then estimated that there would be double the number of London over provincial members, and by virtue of incessant attendance and determination to see my provincial colleagues properly represented, I succeeded in enforcing a by-law that the London members of the Council should not exceed double the number of provincial members. But provincial members were necessarily in the minority, and I could not get a fixed rule made that of the President and two Vice-Presidents one should be a provincial surveyor, although the principle was agreed to, and promised verbally, and has ever since been honourably adhered to.

Time has shown serious defects in our calculations. There are now 107 London members and 84 provincial ones. In order to have double the number of London over provincial members the London members should be increased by 19 (which is impossible), or 12 provincial members should resign.

But the members of the Council vary in inverse ratio, as all past Presidents are *ex officio* members of the Council; thus the number of London councillors is 13, against five provincial ones. Yet just at this time the Council have repudiated altogether their verbal agreement, and by force of superior numbers have elected London members as President and both Vice-Presidents.

The London members, too, have always an advantage in their ability to attend, as the loss of time and serious costs of journeys from the provinces prevents members attending so regularly. The average annual provincial attendance is five (which I think is good), compared with eleven London attendances.

The matter is one of such importance to provincial surveyors, who are thus being entirely swamped by London men, that I have protested to the utmost, unfortunately without effect, and I have therefore resigned my membership of the Association rather than stultify the honourable office to which I have been so frequently elected; and as the only time to act effectually is at the commencement of any irregularity, may I ask you to permit me to appeal through your paper to provincial quantity surveyors for their opinion of the loyalty to my stewardship?

My figures are the official published ones for the last year.—Yours obediently,

W. HOFFMAN WOOD.

No. 8 Queen Square Chambers, Leeds:
November 4, 1912.

MR. B. C. ANDREW, St. Austell, has been appointed local hon. secretary of the Society of Architects.

FORTHCOMING EVENTS.

Saturday, November 16.

Architectural Association : Visit to the Wesleyan Church House, Westminster, S.W.

Edinburgh Architectural Association : Visits to New Masonic Hall and New Hall of United Free Church of Scotland, 121 George Street, Edinburgh.

Monday, November 18.

Royal Institute of British Architects : A paper entitled "Bath : A Comparative Study," by Mr. J. L. Bail, at 8 p.m.
Liverpool Architectural Association : A paper entitled "The Original Drawings for the Palace at Whitehall, attributed to Inigo Jones," by Mr. J. A. Gotch, F.R.I.B.A., at 6 p.m.
Institute of Sanitary Engineers : Paper entitled "Intercepting Traps in House Drains," by Mr. E. Van Putten, M.Inst.C.E., at 8 p.m.

Tuesday, November 19.

Institution of Municipal Engineers : North-Western District Committee meeting at Manchester at 7.30 p.m.
Illuminating Engineering Society : Meeting at the premises of the Royal Society of Arts, John Street, W.C., at 8 p.m.
Royal Sanitary Institute : Adjourned discussion on "The Report of the Departmental Committee on Intercepting Traps and House Drains" (opened by Mr. H. Percy Boulnois, M.Inst.C.E.), at 8 p.m.

Wednesday, November 20.

Northern Architectural Association : Students' Meeting at 6 Higham Place, Newcastle, at 6 p.m.

Thursday, November 21.

Architectural Association : Conversazione at 8 p.m.
Leeds and Yorkshire Architectural Society : Opening Meeting at Queen's Hotel, Leeds, at 7.30 p.m.

MEDIAEVAL FIGURE-SCULPTURE IN ENGLAND.

A SENSE of the amplitude of mediæval art is the dominant impression that we gather from a first perusal of the masterly work* on English figure-sculpture in the middle ages with which Mr. Prior and Mr. Gardiner have endowed us, a field in the corners of which many students and enthusiasts have delved, but whose whole area is now harvested for the first time.

Mediaeval figure-sculpture may be grouped in one or other of two dominant classes, work in the shop and work on the building, and throughout the whole period covered by the authors they ever seem to have this classification in mind and are particular to note when the latter class was independent and distinct, when it was influenced or dominated by the former. It is, however, the view of the authors that, notwithstanding this influence or even at times domination, the real mediæval figure-design was that which was worked all through the ages of mediæval building in the architectural fabric.

Hence the sculpture was always work in building-stone and subject to the capabilities and limitations of the material. The textures of marble and bronze are foreign to its nature, the technique of the craftsman in these materials impossible to the mason and stone-cutter. The mediæval figure-sculptor was but a higher grade of craftsman amongst the masons who worked ashlar, cut mouldings, or carved foliage, and his work was as much part of the architecture as that of his slightly less skilful co-workers. "His art must be accepted as that of a sculptor *lapidum*, not of a modeller with clay or of a goldsmith at his bench."

From the intimate connection of the mediæval figure-sculptor with the actual building it naturally follows that his work is essentially architectonic, it is as much part of the structure as the mouldings or the wall face. Hence it is that we find the general character of the architecture of the period reflected in the figure-sculpture. The strength and intensity of contrast in chiaroscuro of Early English, the delicacy of gradation and of flowing line in Decorated, and the mechanical richness of Perpendicular, all have their counterparts or complement in the figure-sculpture. "In its architectural consistency at least our mediæval art has nothing to ask from the Greek."

* *An Account of Mediæval Figure-Sculpture in England.* With 855 Photographs. By Edward S. Prior, M.A., F.S.A., Slade Professor of Fine Art in the University of Cambridge, and Arthur Gardiner, M.A., F.S.A. (London: Cambridge University Press. 63s. net.)

In another respect also we are glad to find that our authors recognise, as, indeed, the thoroughness of their studies would oblige them to do, that Gothic architecture including its sculpture was akin to the Greek—in the adornment or completion of its finishing with colour and even plaster. The Greek covered his Poros stone and even on occasion his marble with stucco and paint. The mediæval craftsman did likewise.

It is remarkable as further evidence of the position of figure-sculptors in the middle ages who were only sculptor-masons and not sculptor-artists, or at any rate did not pride themselves on being such, that, as the authors point out, Gothic figure-sculpture is never found signed, that we know of, in England, nor are there any notices to show that any special artistic distinction attached to the makers of the most beautiful of art stone reliefs or statues.

Thus the figures for the Westminster chapter-house are described in the accounts only as "*II imagines ad tascham cissas*"—"two figures dressed by the job"—there being no mention of the sculptor.

Even when the names appeared of persons to whom orders were given for sculptured figures it seems that these were merely intermediaries between the client and the craftsman.

During the 14th century, however, there evidently came into vogue the employment of makers of detached figures to order, alongside of the metal working imager, or shop sculptor, whose work was chiefly in metal, and in the 15th century the shop sculptor, whether in metal or stone, seems to have been dominant. For marble figures the shop worker had been in existence from about the beginning of the 13th century, and included amongst them were the workers in alabaster. These craftsmen, however, although working alongside of, and contemporaneously with, the sculptor-mason on the building, are not admitted by the authors as exponents of characteristic mediæval figure-sculpture. It would perhaps be more correct, as well as more generous, to recognise that there were two distinct branches of mediæval figure-sculpture which offered scope for the work of artists of separate class with different aims and potentialities, but each entitled to cordial recognition.

In their detailed treatment of the subject the authors do not ignore the work of the shop sculptors, and thus tacitly admit the position of which we have spoken. They have, indeed, devoted special chapters to the City trade furniture and a special section of their volume in Book III. to the sepulchral effigy.

SUBMITTED FOR PUGIN STUDENTSHIP, 1912.—FROM MEASURED DRAWING BY MR. J. B. LEATHART.

In dealing with the work of the building sculptor the authors have adopted the chronological treatment commencing with the consideration of pre-Conquest figure-sculpture, then Anglo-Norman, and later Romanesque, followed by the architectural work of the three Gothic periods.

In dealing with each of these chronological periods the authors take note of and classify various sub-divisions which appear in each. In this way they give us a very complete analysis, and render comparison easy and clear between the various phases of development and the divergence in the treatment of mediæval figure-sculpture. Thus in the treatment of shop sculpture there is not only a distinction drawn by the authors with regard to the work of different schools, chiefly differentiated by locality, but there is classification and sub-division of the subject according to material used, so that whilst they dis-

tinguished between the characteristics of South-Western, Northern, and Midland districts, we have also distinction between the treatment of Purbeck effigies and freestone effigies, and also of those in bronze, oak, alabaster, and clunch.

By thus sub-dividing their analysis of English figure-sculpture into many sub-sections and treating of each thoroughly the authors have produced a splendidly complete conspectus of mediæval figure-sculpture in England in all its branches.

NOTES AND COMMENTS.

THE Joint Select Committee of the House of Lords and the House of Commons on the three bills before Parliament, relating to the protection of ancient monuments, have issued their report and expressed the opinion that

the Ancient Monuments Consolidation and Amendment Bill (House of Lords) should alone be allowed to proceed. Amongst the salient points in the report is an expression of opinion that the care of ancient monuments should be entrusted to the Commissioners of Works or the council of a county or county borough. In return for the restriction on the rights of property placed upon the owners of ancient monuments, exemption is recommended from liabilities for probate or death duties. This is obviously no more than is fair if owners of ancient monuments are to be prevented for the good of the State from realising and turning into hard cash their property; they thus become, in a sense, trustees for the nation, and ought not to be expected to pay for their enjoyment of the full rights of ownership which they no longer will possess. The Committee are not prepared to recommend the exemption of ecclesiastical buildings from the provision for their preservation as ancient monuments, and they rightly, in our opinion, justify their position by reference to the undoubted fact that although the ecclesiastical authorities are acknowledged to be increasingly alive to their duty of protecting old churches, there are still cases where due regard is not had to architectural and historic considerations. Not only the buildings, but movable property, such as plate and other articles of historical interest, belonging to the Established Church are, according to the recommendations of the Committee, to be by law protected. This, as recent history shows, is a very essential provision, and the property of municipal corporations is, we are glad to know, to be subject to similar treatment.

An important and interesting report has been presented to the Manchester Corporation by Mr. Haydn T. Harrison and Mr. Jacques Abady, on modern lighting systems in Princess and Portland Streets in that city, the former being lighted by gas, and the latter by electricity. In Princess Street modern high-pressure gas lamps of high power are used; in Portland Street efficient flame-arc lamps are used, so that we may fairly say that gas and electricity are here given an opportunity, each in an effective form, of demonstrating their relative advantages. The experts were not entirely agreed, and presented separate and, to some extent, antagonistic reports, but they do agree upon the following points:—(1) That for all practical purposes the degree of illumination in Portland Street and Princess Street is approximately equal. (2) That, based upon the figures of costs of current, and gas, &c., given them by the respective departments, the arc lamps as used in Portland Street are provided at an annual cost which is less than the gas lamps as used in Princess Street. (3) That, as a comparison between the possibilities of arc lighting and high-pressure gas lighting, the results are vitiated by the fact that the high-pressure gas lamps are giving an efficiency very much below similar lamps when properly installed and adjusted.

In the course of their reports the experts have drawn attention to the importance of the method of distribution of the light as affecting its efficiency. They tell us that the most desirable distribution is an increase in candle power as the angle to the horizontal becomes less down to fifteen or twenty degrees. Neither the arcs nor the gas lamps give ideal distribution, but, except for the shadow below the arcs, the former perhaps approach nearer to perfection than the gas lamps. To some extent the particular light distribution of a type of lamp can be allowed for by suitably choosing the height and the distance apart of the lamps. Thus, judging from the distribution, the ratio of height to horizontal distance should be greater for the arcs than for the gas lamps. This is, in fact, the case in the Manchester test installations, but Mr. Abady apparently thinks that advantages in other directions would be secured by lowering the gas lamps from 26 ft. 6 in. to 20 ft. and increasing the distance apart from 107 ft. to 130 ft. The arcs are spaced 121 ft. at a height of 27 ft. 6 in.

We regret to have to record the death of Mr. George E. Grayson, the well-known Liverpool architect. Mr. Grayson was for many years head of the architectural profession in Liverpool. He commenced practice in 1860, on the completion of a long tour in Southern Europe. His best known works include the City Liberal Club, Walbrook, London; the Rainhill County Asylum, the Grain Stores at the north end of Liverpool, and the head office of the Bank of Liverpool. In Castle Street he had almost a monopoly, for he designed the offices of the British and Foreign, Scottish Equitable, Scottish Provident, Messrs. Jones & Sons' premises, Leyland and Bullens Bank, Victoria Chambers, and the extension of the N. and S. Wales Bank. His churches include St. Mary's, Liscard; St. Faith's, Waterloo; and the parish churches at Allerton and Woolton; while innumerable small houses and many large country mansions were designed by him in various parts of England. For many years Mr. Grayson was on the Council and the Practice Committee of the Royal Institute of British Architects, and he was president of the Liverpool Architectural Society in 1886. He was a freeman of the City of London, and served on the Livery of two of the ancient City Companies. He took the late Mr. E. A. Ould into partnership in 1886, and Mr. Hastwell Grayson in 1896, and retired from practice on the last day of the nineteenth century.

BRITISH SCHOLARSHIPS AT ROME.

PARTICULARS have just been issued of the British "Prix de Rome" in sculpture and decorative painting. These scholarships, of the value of £200 per annum each, will be tenable for three years at the British School at Rome. Candidates must be British subjects, and less than thirty years of age on July 1, 1913.

The competition for the prize in sculpture, which will be conducted by the Faculty of Sculpture of the British School at Rome, will be in two stages: (a) An open examination; (b) a final competition, open to not more than four candidates selected from those competing in the open examination. In the open examination competitors must submit the following works: (1) A model of a nude figure in the round from the life, half life size. The model to be executed by the competitor. (2) A model in bas-relief, two feet six inches by one foot six inches, modelled and designed by the competitor, the composition representing not less than two figures. (3) Four drawings from the life, two of which must be of the nude figure, one of drapery, and one of hands and feet life size. The drawings must be the work of the competitor, and must be on sheets of paper thirty by twenty inches. (4) Some drawings or photographs, or both, of original works which have been designed by the candidate. (5) Not less than two photographs or drawings of designs for decorative purposes with architectural features, the designs to have been the work of the candidate.

Competitors must notify the Honorary General Secretary, British School at Rome, 54 Victoria Street, London, S.W., of their intention to compete in this examination not later than February 15, 1913, and with such notification must enclose a certificate of birth, or a declaration as to age and nationality duly attested by two responsible persons. The models must be cast in plaster, and together with the drawings and photographs (which must be unframed and unglazed), addressed to the Honorary General Secretary, British School at Rome, care of James Bourlet and Sons, Ltd., 17 Nassau Street, London, W., and delivered at that address not later than April 5, 1913. The words "Scholarship in Sculpture" should be clearly marked on the outside of each case. The names and addresses of competitors must be clearly written and attached to each work. The works must be forwarded at the candidate's expense. The works will be returned to candidates at their own expense. The Faculty will undertake no responsibility in the case of any damage or loss.

The final competition will be held in London from June 30 to August 23, 1913, and will be open to not

more than four candidates selected from those competing in the open examination. The subject will consist of a design for a figure, group, or relief (as determined by the Faculty of Sculpture), to fill a given space for a given purpose, and to a given scale. Eight weeks will be allowed for the execution of the design, and during that time candidates will be provided with studio accommodation, and given an allowance of 2*l.* per week towards the cost of models, etc. The successful candidate in this competition will be recommended for appointment to the Commissioners' Scholarship.

The scholarship in decorative painting is open to competition on very similar lines.

The competition, which will be conducted by the Faculty of Painting of the British School at Rome, will be in two stages: (a) An open examination; (b) a final competition, open to not more than four candidates selected from those competing in the open examination.

Competitors in the open examination must submit the following works: (1) Not less than four drawings of the nude figure from the life. (2) One painting of a head, and one painting of a figure from the life in oil or tempera. (3) Two figure compositions in colour suitable for wall decoration (not larger than thirty inches by twenty-two inches). (4) Sketches of designs for decorative purposes, which should include some architectural studies. Competitors must notify the Honorary General Secretary, British School at Rome, 54 Victoria Street, London, S.W., of their intention to compete in this examination not later than February 15, 1913, and with such notification must enclose a certificate of birth, or a declaration as to age and nationality duly attested by two responsible persons. The works submitted for the open examination must be addressed to the Honorary General Secretary, British School at Rome, care of Messrs. Chapman Bros., 241 King's Road, Chelsea, London, S.W., and delivered at that address not later than April 5, 1913. The words "Scholarship in Decorative Painting," should be clearly marked on the outside of each package. The names and addresses of competitors must be clearly written on the back of each drawing, painting, etc. The works must be sent unframed and unglazed, and must be forwarded at the candidate's expense. The works will be returned to candidates at their own expense. The Faculty will undertake no responsibility in the case of any damage or loss. The final competition will be held in London from June 30 to August 23, 1913, and will be open to not more than four candidates selected from those competing in the open examination. The subject will consist of a design for a wall decoration to fill a given space for a given purpose, and to a given scale. Eight weeks will be allowed for the execution of the design, and during that time candidates will be provided with studio accommodation, and given an allowance of 2*l.* per week for models. The successful candidate in this competition will be recommended for appointment to the Commissioners' Scholarship.

For the prize in architecture candidates must be less than thirty years of age at the date of entry for the final competition in September 1913. The examination will be graduated in three stages:—(a) An open qualifying examination, the closing date for entry to which was October 31 last; (b) a first competition, open to candidates selected in the open qualifying examination, to the winners of certain scholarships, and to candidates nominated by certain bodies; (c) a final competition, open to not more than ten candidates selected from the candidates in the first competition. For the first competition the following candidates will be entitled to enter. (1) The candidates selected in the open qualifying examination. (2) Winners of the R.A. travelling studentships and of the following R.I.B.A. studentships:—Soane Medallion, Tite Prize, Owen Jones Studentship, Ashpitel Prize, Grissell Medal. (3) Candidates nominated by the following bodies, with a maximum of four from any given institution:—(a) The Royal Academy. (b) The Royal College of Art. And the following institu-

tions "recognised" by the Royal Institute of British Architects:—(c) Edinburgh—The Edinburgh College of Art. (d) Glasgow—The Glasgow School of Architecture. (e) Liverpool—The Liverpool University School of Architecture. (f) London—The Architectural Association of London. (g) London—The London University School of Architecture. (h) Manchester—The Manchester School of Architecture. (i) Sheffield—The Sheffield University Department of Architecture. (4) Candidates nominated by the allied societies of the Royal Institute of British Architects in the colonies. The subject will be set by the Faculty, who will also determine the number and character of drawings required. Candidates will be allowed two months for the preparation of their designs, reckoned from the date of the issue of the subject with its conditions. From the candidates who have competed in the first competition the Faculty will select not more than ten candidates for the final competition. The subject for this competition will be set by the Faculty, and will be announced in the room on the opening of the first sitting of the competitors. The competition will be held *en loge* in London. It will begin at 10 A.M. on a Monday morning and continue till 1 P.M. on the Saturday of the second week following. Competitors will be required on the first day to make a sketch design which shall be covered with a sheet of tracing paper sealed down in the compartment by the Moderator at the end of the first day. In their finished designs the competitors must adhere generally to the idea of the sketch design. The Faculty will select the successful candidate for the Commissioners' Election. The date of the first competition will be March 15 to May 15, 1913. The date of the final competition will be September 15 to October 4, 1913. It is the intention of the Faculty of Architecture to arrange the announcement of subjects for the open qualifying examination and for the first competition so as to enable students in the Dominions to have the same time for the preparation of their designs as the students at home.

NOTES ON BOOKS.

"The Construction of a House. Being the study of building construction presented by means of a set of forty plates containing plans and detail drawings, with letterpress, of a design for a country house, including motor house and chauffeur's lodge." By Charles Gourlay, B.Sc. (Glasgow University), A.R.I.B.A., architect, professor of architecture and building construction in the Glasgow and West of Scotland Technical College. (London: B. T. Batsford. 6*s.* net in portfolio; 6*s.* 6*d.* net bound.)

It has often been said by those who have been giving advice to students in the form of presidential or other addresses that it is far better for a student to make a complete study of some one old building and to understand it than to run about over a wide expanse of country picking up little bits here and there and so making a collection of unrelated fragments.

It is probably with some such thought in his mind that Professor Gourlay has prepared for the use of students of construction this volume containing a complete set of drawings illustrating the planning and construction of a house from start to finish, and this he has done very thoroughly, so that the student who has learnt from other text-books the isolated elements of construction in various trades may now be able to follow their application and mutual dependence in the carrying out of a complete building.

The methods of construction and the naming of the various items are naturally tinged with a Scotch flavour, although the author has in some cases given the English translation of terms which would otherwise be unintelligible to the Southerner.

Thus it strikes one as peculiar that no footings are shown to the walls and the construction of an oriel window is rather differently arranged to that which we should

ordinarily follow; but, although we may find differences, we do not find any fatal errors, so that the book may be recommended as a useful series of exercises for the student who is advanced beyond the elementary stage in his study of construction, especially as many details of fittings are given which in the ordinary way are not included in textbooks.

"The House and Its Equipment." Edited by Lawrence Weaver. (London: "Country Life" and George Newnes, Ltd. New York: Charles Scribner's Sons. 15s. net.)

A house does not become a home until it is equipped and furnished, and no amount of satisfactory planning of rooms and other adjuncts, or sound construction of walls, floors, and roofs will make a home as satisfactory as it ought to be if its equipment and furnishing are bungled, and therefore Mr. Lawrence Weaver has done good service in showing what a number of things there are that go to the satisfactory equipment of a house, and how much better they are managed when the architect who designs the house regulates throughout its equipment and even its furnishing. This is a lesson which the Englishman particularly needs to learn. On the Continent it is generally recognised that the architect is the proper person to regulate and decide the furnishing as well as the equipment of a house, and that this demands a greater amount of experience and artistic training than can be expected from the efforts of the ordinary housewife perambulating the showrooms of Tottenham Court Road. A great many different sections connected with the subject are treated of in the volume edited by Mr. Weaver, and he has adopted the sensible plan of securing contributions from twenty-three different writers who may each be regarded in some sense as a specialist, so that all matters are adequately treated to a far greater extent than any one writer, however omniscient he may think himself, could possibly achieve. For this reason there are few chapters in the book from which the architect in general practice cannot obtain additional information on the most up-to-date methods of equipping a house. To the man who would build or try to improve his house such a book must be of great value in its indication of the possibilities that lie open at the present day for making a house and its adjuncts both beautiful and comfortable.

"Colour Printing and Colour Printers." By R. M. Burch. With a chapter on modern processes by W. Gamble. (London: Sir Isaac Pitman & Sons, Ltd. 12s. 6d. net.)

Modern processes of colour printing have now brought within the limits of commercial possibility the production of printed books with coloured illustrations, and there are several processes now in use which each have their peculiar qualifications, so that it is desirable for anyone who is contemplating the authorship of a publication in which colour printing is to take part to learn something of the history of the industry from the fifteenth century onwards, so that he may not only know what has been and can be done at the present day, but also the special effects that can be got from the processes of the past which, although not now in general use, have, nevertheless, their own peculiar charm and effect. Such knowledge as is here indicated is to be found in the volume before us, which is not only instructive, but interesting to all who have any affection for books and book-making.

"Building Structures in Earthquake Countries." By Alfredo Montel. Translated from the Italian with additions by the author. With 42 diagrams in the text and one plate. (London: Charles Griffin & Co., Ltd. 8s. 6d. net.)

In this country we are fortunately but little troubled with earthquakes of a serious or severe character, but we do occasionally experience the tail end of a seismic wave, and there are areas in some parts of England that for some reason or other are more prone to such experiences than the greater part of the country, so that

architects and builders within these zones may find it desirable to make a study of the experience and research that have been the fountain of knowledge to Italian and Japanese constructors. Such a book as the present will be a necessity to the British students of architecture who propose to practise their calling in the dominions beyond the seas or in the outposts of British influence in the Far East.

The author in dealing with this subject has adopted and added to his own knowledge and experience the labours particularly of Professor Omori, in Japan, where, as we all know, there is plenty of opportunity for observation and experience, and at the present day sufficient scientific training and insight to make the fullest use of the experimental opportunities and to deduce from them valuable lessons in procedure.

"Ornamental Cement Work." By Oliver Wheatley. With 81 illustrations. (London: Scott, Greenwood & Son. 5s. net.)

In the truthful days of the Gothic revival of the last century the idea of any legitimate use of cement or plaster as a material in itself capable of artistic employment would have been regarded as the most rank heresy, for it was forgotten by the majority of Gothic enthusiasts that the productions of the *stuccatori* of the 16th, 17th and 18th centuries conclusively prove that cement or plaster is a material capable of a high degree of durability and of a wide range of artistic expression, provided only that it be treated as a material with its own peculiarities and possibilities and not as a cheap and nasty method of simulating stone work. The author of the present volume has limited his subject to Portland cement, to the exclusion of other forms of plaster which were brought to so high a degree of excellence by the *stuccatori* of old, and he has certainly given us an admirable insight into the possibilities of the treatment of Portland cement as a legitimate material for finished work with a true artistic character provided the man who handles it is an artist.

GREENSTEAD AND ONGAR.*

GREENSTEAD is the Gernesteda of Domesday Book. Its claim upon our intelligent interest is a twofold one. The timber nave of the present church is of pre-Norman date, and the church holds the traditional honour of having temporarily held the remains of the martyred Edmund, King of East Anglia. The illustrated edition of John Richard Green's "Short History of the English People" pictures a coin of the King, and that historian describes the events leading up to Edmund's death. In 866 the Danes landed in East Anglia, and marched in the next spring across the Humber upon York. Northumbria at once submitted to them, and Mercia was only saved by a hasty march of King Ethelred to its aid. But the peace of Nottingham, by which Ethelred rescued Mercia in 868, left the Danes free to turn to the rich spoil of the great abbeys of the Fen. Peterborough, Crowland and Ely went up in flames, and their monks fled or were slain among the ruins. From thence they struck suddenly for East Anglia itself, whose king, Edmund, brought prisoner before the Danish leaders, was bound to a tree and shot with arrows. This martyrdom by the heathen made him the St. Sebastian of English legend. In later days his figure gleamed from the pictured windows of church after church along the eastern coast, and the stately abbey of St. Edmundsbury rose over his relics. With Edmund ended the line of East Anglian under-kings.

The authority for the belief that the saint's body rested in Greenstead Church is Dugdale, who says in "Monasticon" that "it (the body) was lodged at Aungre, where a wooden chapel remains as a memorial to this day. The removal of the remains from London to their final resting place at Bury St. Edmunds took place about 1013."

The church, dedicated in honour of St. Andrew, contains nothing earlier, with the exception of the ancient wooden nave, than the late Perpendicular chancel of red brick; the roof windows and the tower of boards are of modern date, but the whole composition is certainly picturesque, and forms an attractive picture. The ancient woodwork has

* Read at a meeting of the Upper Norwood Athenaeum, by Mr. T. H. Alexander.

not been left undisturbed in the course of time, for although it has weathered the effects of almost exactly 800 years, yet some of it was replaced in 1848, having become worm-eaten. The dimensions of the original nave, as given by "Murray," are 29 feet 9 inches long by 14 feet broad. The walls are 5 feet 6 inches high. There are sixteen logs and two door-posts on the south side, and twenty-one logs and two gaps plastered up on the north side.

The manor of Greenstead was held by Gotild in the reign of Edward the Confessor, and at the Domesday Survey by Hamo Dapifer, with Serlo under him.

On the death of Hamo Dapifer, without issue, his lands descended to his brother, Robert Fitz-Hamo, to whom King William II. gave the honour of Gloucester. He died in 1107, and Maud, or Mabel, his eldest daughter, was married to Robert, natural son of King Henry I., created Earl of Gloucester, to whom she conveyed her uncle Hamo's large inheritance. He died in 1147.

It is not certainly known whether King Stephen took this estate from him on account of his adherence to his competitor, the Empress Maud; however, William, Stephen's son, gave Greenstead, together with Chipping Ongar, to Richard de Lucy, from whose family it passed to that of Rivers, after whom it was conveyed to William de la Hay and the noble family of Stafford, under whom it was holden by the Bouchier family; and on the premature death of Henry, Earl of Essex, in 1540, this, with his other great estates, became the inheritance of his daughter and heiress, Anne, married to William, Lord Parr. Sir Richard in 1548, 1561, and at the time of his death in 1566 held this manor, which belonged to Wm. Bourne, Esq., of Bobbingworth, in 1593, and to the Young family in 1661, from whom it passed to Mr. Gutton, who sold it to Alexr. Cleve, citizen of London, after whom the next possessor was David Rebotier, succeeded by his son, Charles Rebotier.

Ongar possesses a name of very doubtful origin, the general guide-book derivation being "Angra," a separated portion of land. This definition does not appear to bear any relation to the earliest feature of the place—the early entrenchment which surrounds the village. Now, the most ancient thing after the land is the river, and this plainly reveals the Gaelic *rhe* in its name of Roden or Roding. It might be possible to find the ancient form of Aungre in the Celtic Avon, pronounced Aune, and spelt Anne in the case of a Devonshire river. Both words, *rhe* and *avon*, denote a river or flowing stream. The encampment, if it be British or Celtic, would be known as the *don* on the river, and the river-name would prevail for identification.

The Saxon origin of the village is determined by the name, Chipping Ongar, it has always possessed. It was the market place of the district, just as were Chipping Norton, Chipping Campden, Chipping Sodbury, and Chipping Barnet; the latter still retains its horse fair or market. So we have Cheapside and Eastcheap, all derived from the A.S. *ceapian*, to buy; *cypan*, to sell; and *ceap*, price. Another title this place of names has had in the past is Ongar ad Castrum. The castle, built by Richard de Lucy, the founder of Lesnes Abbey, gave the village this distinction. It should be remarked that the river Roding divides Ongar into two parts; one is called Chipping Ongar, the other High Ongar. Ongar was given to Richard de Lucy, who died in 1179, by the Earl of Montaigne, son of King Stephen. Later, Henry II. seized it, amongst many others, and the castle passed into the hands of Rivers de Dipariis, and afterward to the Lords Stafford. It was destroyed in the sixteenth century, and a brick building erected in its place, which, in its turn, was taken down in 1744.

ROYAL GARDENS AS PAINTED BY MR. CYRIL WARD.

THERE are two classes of exhibition which it is difficult for an art critic to discuss satisfactorily; that is to say, if he (or she) is to escape being in turn criticised. These two classes are the unmistakably good and the unmitigatedly bad. For, in doing justice to the former, the critic is regarded publicly as being devoid of the faculty of discrimination, whilst in lashing the latter class the same unfortunate critic is charged as acting on the principle of "Nil admirari." Therefore it is that an exhibition with an admixture of qualities is apt to provide the best material for such a purpose as art criticism. Of course to any art lover this point of view is altogether undesirable; Art for its own sake will require that work shall be good; and the more of this quality and the finer in degree the better.

Moi, qui parle—have from time to time the good fortune (being imbued with the concentrated love of Art) to encounter an exhibition of works altogether good; even as — infandum dolores mihi! at times, and unfortunately there is presented to the gaze a show unutterably debased, unspeakably poor. In such instances the aspect in which the criticism will be regarded by the public must be set aside entirely for the aspect in which it is necessary to regard the exhibition.

Here and now good fortune provides a feast for eye and soul—one had almost added, heart—in the excellent show of works presented by Mr. Cyril Ward on the walls of the Fine Art Society. The subject is full of fascination, and Mr. Ward has made the most of his subject; there is no slightest appeal to the snob in this collection of views of Royal gardens—no figures of royalty, nor even their flunkies or gardeners or pet dogs—merely and solely the landscape views.

But is not this enough when so presented? Granted that under average conditions animal interest in any picture is a desideratum, there are occasions when the specific purport neither requires nor renders fitting the inclusion of life other than that of vegetation. True it is that in the absence of animal life a certain lack of scale may obtain; but somehow it does not seem to be a noticeable deficiency in Mr. Ward's charming sketches, one alone of which provides animal life in the form of swans in "Across the lake, Claremont." A certain proportion of these sketches have been reproduced in a handsome work, written by Mr. Ward, and this volume will doubtless find its way on to many a library table.

Time and again mention is made of an artist's "bright palette," but here the palette is subdued, without being dull. It is as if the habitual haze of the British Isles has been carefully borne in mind by the artist with a resultant sincerity in effect that pleases, without causing any slightest sensation of depression. Mr. Ward's treatment of flower banks is marvellously effective, and his tree modelling is indicative of a close and loving study of arboriculture. Like the Preacher of old, he knows all trees "from the cedar tree that is in Lebanon, even unto the hyssop, that springeth out of the wall." One sketch shows "Osborne House and Terraces," and it cannot but be regretted that this royal residence and Colney Hatch Asylum should mutually suggest each other; the fault lies with the asylum authorities presumably. Imitation may be the sincerest form of flattery, but there are times—. However, this has nothing to do with Mr. Ward's works, of which it seems hopeless to select specimens, where all are so very good. Let the public take the hint and slake its thirst, by imbibing refreshing draughts of Art and Nature at this veritable Pierian spring.

ILLUSTRATIONS.

ANTE-ROOM, PEMBROKE HOUSE, WHITEHALL.

THIS measured drawing by Mr. A. E. Bullock further illustrates the work described by him in his chapter on "Interior Decoration" in our last week's issue.

MUNSTER LODGE, TEDDINGTON.

THE accompanying illustrations exemplify the possibilities of the conversion of old and badly designed houses into designs of interest without seriously interfering with the structure and at moderate expenditure. "Munster Lodge" was originally of the "Victorian builders' type of design, with innumerable battlements to the main roof and front porch and senseless plaster mouldings round the windows. The gables were flat, with wavy barge boards, and the roofs covered with blue slates and the walls plastered with Roman cement.

The principal living-rooms all faced the front fence and overlooked small properties, whilst the garden front, facing a very fine and well-wooded garden extending down to the river, was occupied by larders, store-rooms, and lavatories, completely preventing the full enjoyment of the house and garden.

The growth of small property in front of the house emphasised the necessity of turning the house round.

The alterations, which are simple in their character, have completely remodelled the house, and consisted of a rearrangement of the offices and construction of a new dining-room in the position previously occupied by the offices.

The introduction of a large projecting lead lighted window in the drawing-room, in place of a small sash window, converted a depressing room into a most pleasant one, from which good views of the gardens are obtained.

The roof was removed to the plate level, and re-roofed to a sharp pitch and covered with red sand-faced tiles, the chimney stacks being continued through the roofs in thin Daneshill bricks. Advantage was taken of the extra space gained by the re-roofing to add three bedrooms and a bathroom to the accommodation.

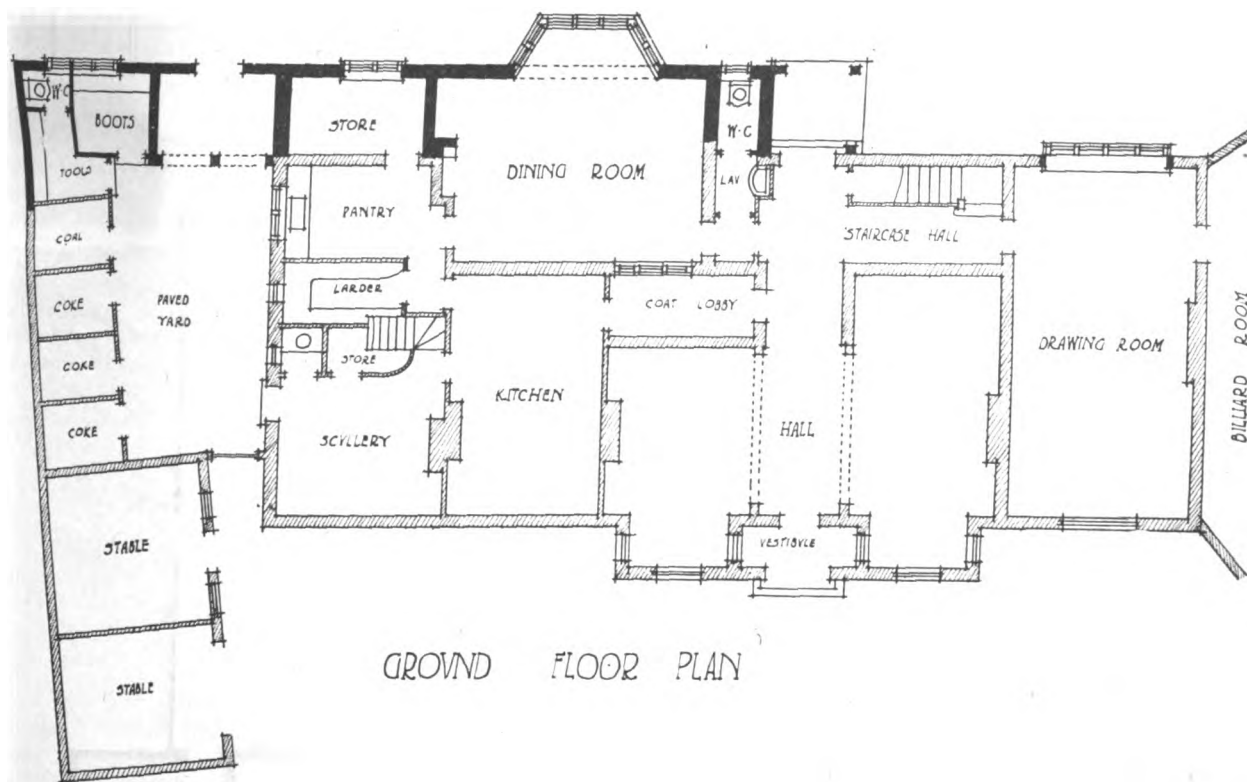

The exterior was stripped of all mouldings and cement work and finished with a white cement rough cast, the old cement sills being replaced with moulded stone sills, and the front elevation relieved by teak Venetian shutters.

from an architectural point of view, are well worth the trouble involved.

For example, take an ordinary flat-faced villa with square openings for the windows, and with all the usual jerry builder's ideas of detail, and place it in the hands of an architect who will give careful study and consideration to the matter, and in all probability he will be able to entirely improve the appearance, with very little more expense than the introduction of a well-designed and suitable cornice to the eaves, and the adjustment of the proportion of the window panes; and in the event of the windows being suitably placed the introduction of shutters, as a frieze, will often restore the balance of the parts. A well-designed entrance door will often complete and give interest to the scheme of conversion. The treatment of the sides and back

SECOND FLOOR PLAN

GROUND FLOOR PLAN

MUNSTER LODGE, TEDDINGTON

The battlements to the porch were replaced by a bold oak cornice, and the front entrance door made a feature, by the introduction of thin Daneshill brickwork.

The dining-room is panelled with oak, and the ceiling has oak moulded beams supported by carved oak brackets. The bay window is of solid oak framing glazed to the floor level with leaded lights and wide iron casements, the central casement forming a French window.

A temporary tarpaulin roof was used for the carrying out of the work, which was executed without materially disturbing the working of the house, the family being in residence the whole time.

Too little attention has in the past been given to the possibilities of converting badly designed buildings into buildings of interest; the field is a large one, and well worth the serious consideration of architects. The results to be obtained in the increased value of the building, as well as

of these buildings in accordance with the front is of vital importance.

The interior arrangements are often extremely simple of conversion by nothing more expensive than a few lengths of 4-inch by 2-inch deal slats replacing the well-known fussy mouldings round the doors, windows and walls, and careful attention to the possibilities of the fireplaces and stairs.

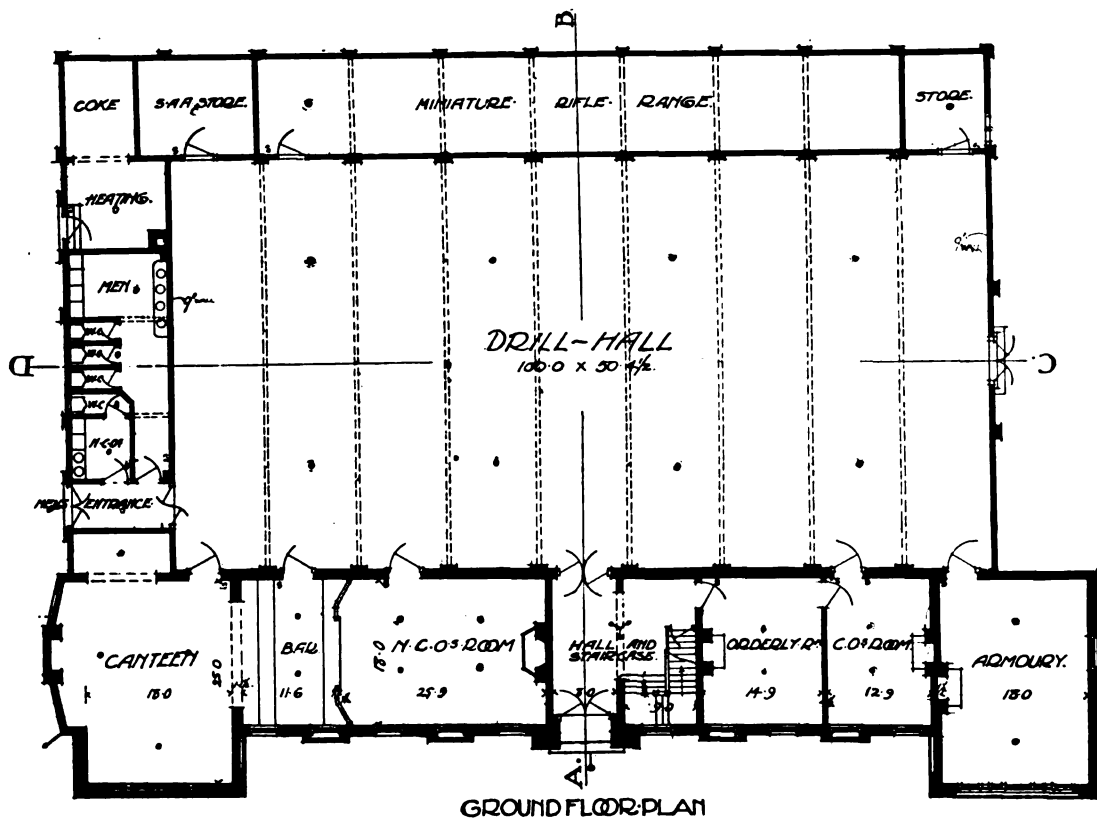

A very charming effect was obtained in "Munster Lodge" by the simple process of placing the doors directly opposite to one another, and glazing the top panels, thus giving a vista through the house in two ways, and a view of the garden beyond to a person entering.

The work was designed by Mr. A. Jessop Hardwick, F.R.I.B.A., and executed by Messrs. Gaze & Sons, of Kingston-on-Thames, the whole of the casements and leaded lights and other metal work being entrusted to Messrs. Humphries, Jackson & Ambler.

THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held at their premises, 28 Bedford Square, W.C., on Thursday, November 14, when the President, Mr. Percy B. Tubbs, F.R.I.B.A., delivered the following inaugural address:—

I wish to express my appreciation of the honour which the members have conferred upon me in unanimously electing me President of the Society, and my sense of the responsibility incurred by the holder of that office, the highest which it is in the power of the Society to confer upon any of its members. I also feel that my task will be rendered more difficult than usual in having to follow my predecessor Mr. Bond, who has rendered the Society such great service, particularly during the past four years that he has occupied the Presidential chair, but I realise to the full that I shall have the co-operation and assistance of the entire Council, and with their support and the help of the Society's capable and obliging permanent staff—who are always ready to afford one any assistance that lies in their power—I hope I shall be able to fulfil the office with some credit to myself and advantage to the Society.

It is customary for the President to present an address embodying his personal views on matters affecting the interest of the Society and the profession, but owing to the fact that there are in the United Kingdom some eighteen architectural societies and that each President has a similar duty to perform in the way of an address, there is necessarily some overlapping on professional matters, and the task of preparing an address is one of unusual difficulty.

The Annual Report of the Council, which has been for some time in the members' hands, deals with the growth and development of the Society in detail, and therefore I will only touch briefly upon one or two points in connection therewith.

It has been found advisable by the Council during the past year to revise the Articles of Association so as to provide machinery for the more effective administration of the Society's affairs as a corporate body, both now and in the future, and for extending its scope and sphere of utility.

The proposals for the reorganisation of the Society are already in the members' hands, and as no new principles are introduced it is confidently hoped that the Council's proposals will be confirmed.

EDUCATION AND ELIMINATION.

They include the introduction of a new class of students to be designated "graduate," who will be men who have been examined as to their artistic capabilities with a view of eliminating those who do not show sufficient artistic ability to become successful practising architects of the high standard that the future will demand. Nothing, perhaps, has done more in the past to lower the standard of architecture and to retard its progress than the entry into the profession of those who have not the instinct for architecture—it has been detrimental to all concerned.

The community has got commonplace building instead of architecture, and the profession has got discredit, while many very capable architects have been placed in a false position and those of special aptitude denied that real and permanent success they might have achieved in some other and to them more congenial profession.

This raises the question of architectural training generally, in regard to which a special Committee are already actively at work on the details of a scheme for the establishment of architectural ateliers in the United Kingdom on the lines of those which are so successfully carried on in Paris.

This Committee have already held several meetings, and I have no doubt will be able to come to a satisfactory conclusion in due course. I shall hope to see their report adopted and carried into effect without delay, so that before long ateliers may be established both in London and the large provincial towns. The Council, in taking a step so fraught with possibilities for good, hope for and confidently anticipate the cordial approval and co-operation of that large and ever-growing body of professional opinion, which is alive to its value and necessity. A question of such vital interest to the future of architecture does not concern this Society alone. The idea being to supplement the existing methods of training rather than to supplant them, it should receive the support of every Architectural Society. We therefore invite the whole-hearted and active co-operation of the Royal Institute of British Architects and its allied societies and of all other interested bodies, so that we may accomplish more quickly and more efficiently a reform which we are convinced is in any event bound to come in the near future.

Those who have studied the various methods of architectural training are of opinion that while there may be some faults or weaknesses in points of detail in the French system, yet it has proved in principle to be of the greatest possible advantage to the profession where it has been adopted. This is particularly the case in America, where, since the introduction of the Beaux-Arts system, the whole tone and standard of architectural design has been enormously raised within a comparatively short period.

In the United Kingdom there are a number of architects of great ability and eminence, and we may be said to possess a distinctive architectural style, particularly in domestic work, yet we are far behind other countries in the public appreciation of architecture as an art and in the standard of architectural design as applied generally.

PUBLIC RECOGNITION AND APPRECIATION OF ARCHITECTURE.

I think we may venture to believe without undue optimism that we are fast approaching a time when architecture will at last come into her own again, and resume that place in the public estimation which is her due, and which she already enjoys in more favoured countries. On all sides we see indications of an increasing public interest in the greatest of the fine arts.

Parliament has recently for the first time in this country, so far as I am aware, taken architecture seriously, and during the debate on the proposed St. Paul's Bridge laid down the principle that no public improvement should be carried out without due consideration being given to the architectural aspect or without consulting those qualified by nature and training to advise. Then the Town Planning Act (again for the first time in this country) has officially recognised the value of architectural beauty and has given it the sanction and authority of an Act of Parliament, and the art of architecture is recognised and protected to some extent by the recent Copyright Act. These are what I believe to be signs of the times, signs that may be noticed with increasing frequency both in the Press and in ordinary daily intercourse.

It is for us to rise to the occasion, and if we expect recognition as artists we must be artists, and well trained ones too. Unfortunately, however, it has long been felt by those who have given much thought to the training of architects that our present system is far from satisfactory and not adapted to produce the trained artist. Since the breakdown of the pupilage system, which was so scandalously exploited by a previous generation, great progress has undoubtedly been made in building up architectural schools to replace it. We have done the best we could, but, hampered as we have been by our own haphazard upbringing and by our own lack of theoretical and systematic training, it was not to be expected that we could know all at once how best to organise a perfect system of architectural education or be in a position to impart a theoretical training which we ourselves had not received.

It is generally conceded, I believe, that, however well our schools may teach the various branches of knowledge with which an architect should be acquainted, they are not so successful in teaching the student the one thing needful, viz. how to apply this knowledge. They may teach everything connected with architecture, except the art of architecture itself, the art of design. I believe I am right in saying that the most enlightened opinion of the day realises how far we are in this respect below the Continental schools, more particularly those of Paris, to which so many architectural students are going every year owing to the lack of facilities in their own country.

The Society of Architects has always striven in the cause of architectural education, and the Council are of opinion that the time has arrived to make a determined effort to lift our educational system to the level of that obtaining on the Continent.

This is no light undertaking, and it cannot be brought about all at once, but your Council believes that an important step towards this end may be achieved by their proposal to bring within the reach of all concerned those educational facilities which have been responsible for producing most of the best architects of the day, both in Europe and America.

REGISTRATION OF ARCHITECTS.

The Statutory Education and Registration of Architects is a question which the Society has made its own and with which it has been identified for upwards of twenty-eight years, and in order to achieve the result which we all have so much at heart negotiations were entered into with the Council of the Royal Institute of British Architects more than two years ago. The negotiations were primarily on

the registration question only, but the proposals of the Royal Institute Council differed so essentially in principle from those of the Society that we could not accept them, and the only way out of the difficulty, so far as the Institute was concerned, was to make provision for the members of the Society to join the Institute so that in any Registration Bill put forward by the Institute their interests would be protected. In other words, the proposed fusion was to the Society merely a means to an end, and that end was registration.

The Society have always stated that if the Royal Institute will produce a Registration Bill with which they can agree they will step aside and let the Institute lead, and the Council of the Society kept their word by accepting the proposals of the Council of the Royal Institute. As you all know, the proposals were submitted to the members of the Institute in general meeting, but after a lengthy and somewhat heated discussion the whole matter was referred back to their Council for further consideration, and they have been considering it in Committee ever since. This action was taken by the members of the Institute more because the proposal was complicated by the introduction into the proposed agreement between the two bodies, of all sorts of provisions, including the heads of a Registration Bill, than because the principle of the scheme was objected to.

Until the Committee's report is issued it is not possible for the Council of the Institute to make any official statement to this Society, but the negotiations have not been broken off, which is a great advantage, as it is always possible that the two bodies may meet again and resume their deliberations. Unfortunately, we are not in a position to guarantee that the negotiations will be renewed, and in the meantime the work of the Society on behalf of registration has been held up for two years, and if we are to await the result of the deliberations of the Committee of the Institute before taking any action the whole question may be retarded for an indefinite period.

We feel that the more delay there is in introducing a Registration Bill into Parliament the less chance there is of its becoming an Act, consequently it would be unwise in the interest of our members to further delay the matter pending a final report from the Institute. Registration is of such vital importance that it cannot be left in abeyance indefinitely, and under these circumstances we feel it a duty to the members to introduce the Society's Bill into Parliament at the earliest possible moment, and we hope that it will be presented during the present Session.

We do not yet know what attitude the Royal Institute of British Architects will adopt in this event, but we do know that the present Council, and the Institute as a corporate body, are pledged to registration, and further, seeing that the R.I.B.A. Council was returned last June for the express purpose of carrying the registration movement a step further, I do not see how they can consistently oppose the Society's measure, or what they can gain by doing so.

I am glad to say that a better feeling undoubtedly exists between the Society and the R.I.B.A. than ever before, and if full advantage is taken of this on both sides great progress may be expected in the near future, not only with regard to registration, but in connection with other necessary reforms that are urgently needed in the profession.

OFFICIAL ARCHITECTURE.

The question of official architects is one which most seriously affects the future of our profession. Just when a generation of able men has arisen who have devoted their lives to the study of the more monumental aspect of architecture, we find the growth of a system which threatens to deprive them of their livelihood and of any opportunity of placing their special attainments at the disposal of the community.

But, although the growth of the practice of employing official architects deprives the independent and specially trained men of the bulk of the public work, it is necessary to endeavour to approach the subject from the broadest possible point of view, in the interest of the public and the advancement of architecture, for, after all, architects exist for the good of the community.

I think that the present system only exists because the public is misinformed, and it will only continue to exist just as long as the indifference and ignorance of the public lasts.

The public has a right to the services of the best talent in the country, but under the present system it does not get it, although it may be under the impression that it does.

There can be no doubt that every building erected by public authorities should be designed by the one man in

the country who is best able to solve the particular problem involved. The system of employing the official architect does not insure this, and the public interest suffers in consequence. Instead of securing the best available architect by public or limited competition or otherwise, we find Corporations and Government departments entrusting important buildings, requiring special skill in design, to the officials who were appointed to their positions for qualities of an entirely different character, such as administrative ability or because of their special qualifications as surveyors.

The public does not seem able to discriminate between knowledge and skill, the knowledge of the requirements of a building or of a public department, which other than architects may acquire, as distinct from the trained skill of the designer in the use of that knowledge when acquired, which no one but an architect can possess.

The public does not realise that the arguments which apply to the appointment of surveyors and medical officers of health do not apply to the appointment of architects. One never hears of a medical officer of health being called upon to perform a serious abdominal operation on a Lord Mayor; he calls in a specially trained man to do it, but we do hear only too often of an official architect being called upon to design a building requiring special knowledge and skill, and it seems to me that a life of official routine faithfully performed does not foster the development of the imaginative faculties or make for the high standard of skill in design, obtained only by long years of practice which all our public buildings should show. Neither does the public realise, as it ought to be made to realise, that the ablest designers we possess do not and will not hold official positions under present conditions, and that when a public body advertises for an official architect the very men to whom the public work should be entrusted refuse to apply for the post.

Figures have lately been produced to prove that it is as economical to employ officials as to employ independent architects, but even if this is true the value of the article obtained is not the same. The lower standard of design produced by officials compared with what might be produced by the very best of our designers destroys the value of the comparison.

If the conditions of official service were so revolutionised as to tempt the most gifted designers to sacrifice their independence and produce the best possible architecture in their capacity as officials, the cost of official architecture would be far in excess of what it is at present, and far in excess of what it would cost to employ the same man as an independent architect, under conditions that entail no sacrifice on their part.

It appears to me that there is a certain obligation resting on the President of such a Society as this to place these facts before the public without fear or favour, for after all the public suffer most by the present system, and it must be clear that if the present tendency increases till all the public work is done by officials the ablest men, finding no opportunity in this direction, will no longer devote their attention to public work, but will concentrate on private work, and the standard of public buildings will be permanently fixed at that level of respectable mediocrity that is now characteristic of nearly all the official architecture in the country. I venture to think that when the public realise that they get better work for less money by employing an independent architect they will not hesitate to demand an alteration in the present system, and will not be content till they get it.

It must not be supposed, however, that an architectural department for routine and advisory work is not capable of doing good public service; on the contrary, I think it almost indispensable, but it should not be employed in original creative works of architecture. Many of our public authorities maintain a staff of assistants of a high standard of knowledge and experience who are intimately acquainted with the practical requirements of every class of public building, and if this knowledge and experience could be placed at the disposal of the most brilliant creative designer obtainable, when any original work was contemplated, the result would be a blending of the practical with the artistic and the production of a well designed and thoroughly satisfactory public building.

THE R.I.B.A. AND THE SOCIETY.

With regard to the future of the two societies which represent the profession of architecture, there is a point I should like to bring forward which I venture to think is worthy of the most earnest consideration of the R.I.B.A. and of this Society, as they each have the same object in

view, viz. the advancement of architecture and the protection of the rights and privileges of architects. As at present constituted and administered, there is of necessity a certain amount of overlapping and clashing of interests which is much to be regretted.

The Institute has a Royal Charter which was granted "for the general advancement of civil architecture and for promoting and facilitating the acquirement of knowledge of the various arts and sciences connected therewith, it being an art esteemed and encouraged in all enlightened nations as tending greatly to promote the domestic conveniences of citizens and the public improvement and embellishment of towns and cities."

One gathers that the Council of the Institute is very much overworked. This sometimes involves considerable delay in dealing with important points that are constantly arising, many of which are perhaps not directly connected with civil architecture or the various arts and sciences connected therewith, but have more to do with the business side of the profession.

Now, in the medical profession there are the Royal Colleges of Physicians and Surgeons, and there is the Medical Association, and what seems to happen in this case is that matters of real business interest and things affecting the pecuniary interests of the members of the profession are left to the latter body to deal with, while the Royal Colleges confine their attention to examinations and ethics, and to upholding generally a high standard of medicine and surgery. Why should not architects work on somewhat similar lines? The R.I.B.A. might be the sole examining body and be responsible for a standard of ethics. Relieved of routine work of a business nature, which now appears to cripple its energies, it would be free to devote all its time to the duties imposed upon it by its Charter and to work for the advancement of architecture as the mistress art, regardless of all other considerations. It would find more time to consider new ideas, to discuss and formulate schemes for the future progress of our art and to give the lead in the artistic, scientific, and ethical aspects of our work, of which we always stand in need. Freed from considerations of expediency or suspicion of personal interest it would speak with greater authority, would take an even higher place in public estimation than that which it now rightly holds, and be a Society to which it would be still greater honour to belong. But no art can flourish unless those who practise it can live by it in decency and comfort and receive that consideration from the public which the value of their work deserves. The Society, by giving its undivided attention to studying the welfare and the business interests of all members of the profession, would be doing a work of paramount importance equally necessary to the advancement of architecture, even if less ornamental than that performed by the Institute. It would then be still more to the interests of every practising architect to join the Society.

Apart from the mere increase in the number of practising architects, the increasing complexity of our civilisation entails upon a profession such as ours, which touches life at all points, an ever-increasing number of problems that call for solution, our interests from day to day become more varied, our responsibilities more vast. But although one Society, if properly organised to that end, might be capable of dealing with every aspect of our responsibilities and interests, I think it would be a distinct advantage to have two societies in London working in perfect harmony, each supplementing the other, each with its clearly defined duties and sphere of influence. I am of opinion that if some such arrangement as this could be agreed upon by the R.I.B.A. and this Society it would be a great advantage to the profession and to architecture as a fine art. There should be no real difficulty in determining the functions of each body; they would naturally fall under the two headings of architecture and architects.

DEVELOPMENT OF THE SOCIETY.

Returning to questions affecting the interests of the Society, there are many ways in which members can co-operate with the Council in developing and extending its work and influence.

The Society's examinations are being extended and the syllabus revised, and very shortly new conditions will come into force and the scope of the examination will be considerably widened by the introduction of the "Graduate" class to which I have already referred. However perfect a system of education may be, it requires the right material to work upon. The examination for the graduateship class therefore will be directed to the selection of suitable mate-

rial and to the rejection of the unsuitable. Coming as it will at the very beginning of the students' career, it will save them from wasting further time and permit them to turn their attention before it is too late to some other occupation in which they will find fuller scope and more adequate reward for their energies.

This examination will also be a good test of the student's general knowledge and his ability in writing essays, which will have to be amply illustrated by sketches and perspective drawings. He will also be required to have a very sound elementary knowledge of the orders and styles of architecture, which he will have to demonstrate to the examiners by preparing drawings and details under supervision, and also by submitting testimonies of study.

If the student has not the necessary qualifications he will be relegated to his studies, and unless he is able to pass the examination by the time he is twenty-five years of age he will be advised to turn his attention to some other calling.

Personally, I think the sooner this happens the better, and that the age limit of twenty-five is too high, in which case it may be found good policy in the very near future to reduce this considerably. I think myself twenty-two would be a more suitable age, but neither arrangement would debar anyone wishing to become a graduate from passing the examination at any age that he cares to sit for it, and it will, I think, be a good guide to the student or his parents or guardians if he sits for the examination and fails and is no longer able to call himself a student of the Society. It is hoped this will have the eliminating effect we desire. The profession is already too full of unsuitable half-trained men. If we can stop this in the future and get a Registration Bill passed as well, the profession will be in a far better state than it has ever been before.

The Building Fund is one of the matters which has been in abeyance owing to the uncertainty of the negotiations with the Royal Institute, but it is thought desirable that the attention of members should be again directed to this matter, and I think that if those members who have not already contributed would do so to the extent which circumstances permit we should soon be able to clear off the debt on the building, which now stands at about £1,000, and provide the nucleus of a fund for the completion of a building scheme. I suggest that as the annual subscriptions are now being paid, members might take an opportunity of, say, doubling their contribution for once, in which case the object would be attained.

Owing, no doubt, to the fact that a very large number of our members are resident in the provinces, the meetings of the Society in London are, in common with other similar meetings, not so well attended as they might be, and I think serious efforts should be made to ensure a better attendance. It is not always easy to arrange for suitable and interesting papers, so the Council would be very glad to receive offers of papers from members or suggestions for making the meetings more popular with members and generally useful to all those interested in our proceedings. If any members have suggestions to make that would tend to make the meetings more attractive, and will be good enough to communicate with the Secretary, they shall have the most careful consideration. Writing a paper is by no means an easy task, and it is a poor compliment to the author who has taken an infinite amount of trouble to prepare one, if when he comes to read it his audience is but small. The Society has purchased a new lantern fitted with a powerful arc lamp and possesses a screen for the display of the pictures which is as good as it is possible to get, and now that we have every facility for getting the best possible results from slides, I hope that members will come forward and read papers and illustrate them, knowing that everything is at their disposal to do their illustrations justice.

PROFESSIONAL DEFENCE.

A very important extension of the work of the Society is the formation of an Advisory Committee to deal with questions arising out of professional practice.

A considerable sum has been set aside to enable this Committee to practically and financially assist members in any litigation or negotiation which involve questions of principle affecting not only their own interests, but those of the profession generally. The fund, which is ample for present needs, is only a nucleus, and it is the intention of the Council to add to it as may be necessary, so as ultimately to be in a position to fight any case which, in the opinion of the Council, acting on the advice of this Committee, is of sufficient importance to the profession as a whole.

This is not, I believe, the first professional Defence Committee to be formed, but it is the first to be provided with a fund to enable it to take action.

As this Committee is constituted, we have the assistance of very capable legal men and competent and influential men of affairs, and by consulting this Committee we shall have the advantage of the advice and opinion not only from the legal but from the professional and practical point of view also.

We cannot help feeling that this Committee will be able to do some valuable work in the interest of the whole profession.

ARCHITECTURAL COMPETITIONS.

The remedy for unsatisfactory competition conditions rests very largely with the profession itself. The promoting bodies do not always purposely err, but are sometimes in ignorance of the existence of the conditions which the profession consider should be laid down for competitions. Something might be done by having a statement issued in the first place to every local authority in the kingdom, and from time to time to other promoters of competitions, giving the general lines on which it is suggested a competition should be conducted, and making it clear that if these lines are departed from architects who are members of Architectural Societies will refrain from competing. This circular should be signed by the responsible officials of every Architectural Society in the kingdom. I also feel that an advertisement inserted each week in the professional journals making it clear to all promoters of architectural competitions that the conditions have to be approved by the Society before any of their members will compete, and suggesting that the conditions governing the competitions should be drawn up to agree with the printed particulars issued by the Society and the R.I.B.A., would very soon educate the promoters up to a proper standard, and the competitions of the future would be much more satisfactory. Much could also be done if the Competitions Committee of the Royal Institute, for example, were to give notice of any objectionable conditions to every Architectural Society, so that all might act in unison.

Some architects hold the view that in the case of limited or local competitions if the invited competitors or the architects within the defined area are agreeable to the conditions laid down, whatever they were, such competition should not be barred by Architectural Societies, but I personally feel that all competitions should be conducted on recognised lines and that there should be no exception to the rule.

ARCHITECTS' BENEVOLENT SOCIETY.

The Benevolent Society does an immense amount of good, and is capable of doing a great deal more, but is hampered by the want of funds. Every member of the profession should, I think, feel under an obligation to give either a donation or an annual subscription, and thus know that he is doing something, however small, to help his less fortunate professional brethren. The Council of this Society has recently doubled its annual subscription, besides giving a donation, and I hope that during the coming year the Finance Committee will be able to recommend doubling the subscription again.

NATIONAL INSURANCE ACT.

As will have been seen from the Annual Report the Society is co-operating with the R.I.B.A., the A.A., and the Surveyors' Institution in the formation of an approved society under the Act for architects' and surveyors' assistants. The idea is a good one, and it is to be hoped that it will meet with the general support of the architects' and surveyors' assistants, who are compelled to insure under the Act.

A Committee has been formed, and considerable progress has already been made. It is felt that architects' and surveyors' assistants are particularly good lives and as a class run very small risks. In addition to this, they very soon earn more than £160 per annum and cease to be insured under the Act. It is considered that under these circumstances the Society should very soon be most prosperous and in a position to distribute increased benefits beyond those prescribed by the Act. It is, therefore to be hoped that it will meet with universal support, and that architects and surveyors in practice will subscribe their 10s. 6d. per annum and become honorary members and so help to establish a fund which will be used later on, when circumstances permit, to establish a sound benefit institution apart from the National Insurance Scheme.

THE UNATTACHED ARCHITECT.

A great deal of interest has been shown in the proposal of the Society to publish a code of ethics for the guidance of members, but the main difficulty has been that of dealing with the unattached architect. The ideal arrangement would be a Board of Professional Control for the whole profession, but this could only be effectively constituted under a Registration Act. It remains in the meantime for the various societies to insist on a high standard of professional morals and conduct on lines somewhat similar to the Society's proposals.

Whilst on the question of the unattached architect, I should like to point out that the ranks of the R.I.B.A. in any class are now closed to candidates other than those who have passed the Associateship Examination, but there are still very many qualified architects in practice who are unattached and are consequently "free lances," and this seems to me to be a disadvantage to the profession, which would be the stronger for their co-operation, and I think it should be the aim of this Society to do all in its power to enrol such of these gentlemen as are eligible and qualified in our ranks as members.

It must not be forgotten that if a Registration Act was passed it would, no doubt, recognise all vested interests and consequently all *bona fide* qualified architects would be entitled to register, and we, by adopting the policy I have outlined, would only be anticipating what would be compulsory when the Act became operative.

The R.I.B.A. have succeeded in getting some 2,000 architects to become Licentiates, but numbers of these appear to have joined under the misapprehension that it would be quite easy, in fact more or less a matter of form, for them to become Fellows of the Institute. As a matter of fact, only ten have been able to satisfy the examiners and qualify as candidates for election as Fellows at the first examination which has been held. This examination proved not to be a mere matter of form, but a very real test extending over six days. How Licentiates feel about this I do not know, but possibly some or even many of them would rather be corporate members of a progressive and thoroughly up-to-date Society, making for reform all the time, than merely non-corporate members of the senior body. I for one shall watch future developments in this respect with great interest.

BRANCHES OF THE SOCIETY.

The South African Branch of the Society, which has been established for six years, has proved to be of the greatest benefit to the Society and to the profession in that part of the Empire, and the fact that the membership in South Africa is increasing at a satisfactory rate shows that the argument that the Society cannot appeal to architects at a distance is without foundation.

The passing of the Transvaal Architects' Registration Act was largely due to the energy and initiative of the branch, backed by the financial support of the parent Society, and further efforts are now being made by the branch towards extending the Act to the Union of South Africa, in which we shall again heartily and practically support them.

I hope that it may presently be possible to form other branches in various parts of the Empire with a view to extending the utility of the Society and working towards that unity in professional matters which is so much to be desired.

SOME ADVANTAGES OF MEMBERSHIP.

Although we have very considerably increased our numbers during the past year and have now a total membership of over 1,200, we are not progressing in this respect as fast as could be desired. There is no reason why the membership should not easily be doubled if members would co-operate in nominating duly qualified architects to membership.

The Society can offer many attractions to its members. It has a comfortable and well situated home, and a useful loan library which is being constantly added to and which is found to be of the greatest advantage, particularly to country members.

It has drawn up a code of ethics for the guidance of its members, and has a professional Defence Committee with a fund to fight cases for members and generally to protect their interests.

It is the first to make an attempt by the introduction of the graduate class to raise the standard of the profession by the elimination of those without the proper personal qualifications at the very beginning of their careers as

students, and it is taking the lead in introducing into this country the Beaux-Arts atelier system for the study of architecture.

The *Journal* of the Society forms a most useful link between the members, particularly those in the country, and might be more frequently used as a means of intercommunication than is the case at present. It contains a great deal of useful information in addition to the proceedings of the Society, and the Council are always glad to receive suggestions for its improvement.

The Students' Section offers many privileges and advantages which can be shared by country students equally with those in London, particularly those connected with the examinations, competitions, scholarships, the use of the loan library, and the receipt of the Society's publications, any one of which is more than worth the small annual subscription which, as a matter of fact, hardly covers the expenses incurred in issuing the *Journal* and other literature. If members would make a point of enrolling their pupils and assistants as students or as candidates for the graduateship or membership examinations it would greatly strengthen the Society as well as benefit the candidates concerned.

FRENCH RENAISSANCE ARCHITECTURE.—V.

THE fourth of the ten lectures on French Renaissance architecture, now being delivered by Mr. W. H. Ward, M.A., A.R.I.B.A., at University College, Gower Street, W.C., had carried the subject down to the period of the Wars of Religion. In his fifth lecture he dealt with "The Styles of Henry IV. and Louis XIII.—Utilitarian Architecture and the Barocco Influence."

In 1588 Henry III., the last of the Valois, was assassinated. There followed several years of hard fighting between the Huguenots and the Catholics before his Protestant cousin, Henry of Bourbon, King of Navarre, was finally recognised. Henry IV. was a strong ruler, eager for the establishment of order and the centralisation of all effective power in the monarchy. In letters and art the Roman qualities of majesty and power, order and law came to be valued above the Hellenic ones of subtle proportion and refinement. The growing tendency to subordinate the part to the whole, beauty of ornament and detail to the total effect of a composition, became accentuated. The seventeenth century was an age of prose rather than of poetry. Art was with Henry IV. less a gratification of the sovereign's personal taste (as it had been for the Valois) as of the administration of an element in the re-established national welfare.

Architecturally, explained Mr. Ward, the reigns of Henry IV. and of his son Louis XIII., which extend from 1589 to 1643, might be treated as a single period. He summed up the salient characteristics as being a broad, masculine sobriety, a bold scale and simplicity in composition, massive solidity inclining to heaviness, little and coarse ornament, slight use of the orders, but considerable use of rustication, especially in combination with brickwork, finally a predilection for curved forms in the way of roofs. This architecture as usual reflects the broad characteristics of the life of its age.

The buildings of this period are as a whole remarkable for their absence of decoration. Such of it as was employed is bold in scale and coarse and grotesque in character. It may be traced to the school of free Classic design initiated by Michel Angelo, which had developed during the sixteenth century in Rome and elsewhere into the so-called Barocco style. In its early forms it had been introduced into France by Il Rosso, Primaticcio, and their assistants. About the same time it also passed into the Spanish Netherlands, where it grew fat and fleshy, qualities which reacted on French decoration in the early seventeenth century.

There were other aspects which Mr. Ward placed side by side with these to give a proper understanding of the origins of the architecture of Louis XIV. One was the persistence of a thin vein of purer, more refined tradition of detailing and decoration; a second was a development in internal planning called forth by novel social requirements, a third the revival of Classical study among architects, and a fourth the growth after a period of depletion in the ranks of the profession of a line of great architects who, while working to some extent in the prevailing manner, gradually eliminated its coarser features and evolved a type of architectural treatment worthier of the great beginning of the mid-sixteenth century.

Up to the time of Maria de Medici's regency, that is until the death of Henry IV. in 1610, anything like coherence in internal planning was conspicuous by its absence. The apartments in the greater houses consisted of several large halls, used indifferently for any purpose, and a series of small private suites with little intercommunication except by external galleries and staircases, while the position of the unglazed main stairs in the centre of each wing prevented anything in the nature of a suite of apartments. Towards the end of Henry IV.'s reign new social habits brought about a new type of plan, the invention of which is credited to Madame de Rambouillet. This cultivated lady held in her hotel near the Louvre receptions where men of letters and art rubbed shoulders with the nobility. These receptions called for an uninterrupted suite of drawing-rooms, each of moderate dimensions, so as to accommodate comfortably a small group of persons yet easily accessible to each other, and at the same time well lighted and with a pleasant outlook. The plan of the Hôtel de Liancourt, designed by Salomon de Brosse and begun in 1614, is a good example of the manner in which these requirements were met.

In conclusion, Mr. Ward rapidly dealt with the prominent architects of the period, such as De Brosse, Le Mercier, and Mansart.

THE ROYAL SANITARY INSTITUTE.

A MEETING of the Royal Sanitary Institute was held at 90 Buckingham Palace Road, S.W., on Tuesday, the 12th inst., when Mr. H. Percy Boulnois, M.Inst.C.E., Chairman of the Council of the Institute, opened a discussion on "The Report of the Departmental Committee of the Local Government Board on Intercepting Traps in House Drains."

The controversy with regard to the question of intercepting traps, said Mr. Boulnois, is not new. At a sessional meeting of the Royal Sanitary Institute, held in London in 1906, Dr. Butler, medical officer of health of Willesden, read a paper entitled "Is the Intercepting Trap a Failure?" and Mr. Read, the city surveyor of Gloucester, followed with a short paper on the same lines. Both these gentlemen condemned the trap as a failure to secure isolation from the sewer.

Dr. Butler evidently did not let the matter rest, for in 1908 the Willesden Urban District Council approached the Local Government Board with a proposal to adopt a series of building by-laws, in which the requirement as to the provision of an intercepting trap was to be omitted. The Local Board refused, but promised that an inquiry into the question should be made.

A Departmental Committee was formed, investigations and inquiries proceeded, and after four years' work the report of this committee has been published.

The report practically condemns the intercepting trap. Our long-cherished belief in the efficacy of the trap has been rudely shaken, and it behoves us to very seriously consider this report and the conclusions at which the committee have arrived. For at least thirty years the Local Government Board have insisted on the provision of an intercepting trap and proper air circulation in all by-laws relating to house drainage; and it will be interesting to see what line will now be taken by the Board in view of this report from a committee of their own officials.

The members of the committee are all highly experienced in their respective professions. The report bears evidence of the extreme care and labour with which the investigations were made, and the manner in which the conclusions were arrived at.

Various indictments are raised in the report against the use of the intercepting trap. The conclusions at which the Committee have arrived in each case may thus be dealt with:—

No. 1.—That as the trap forms an obstacle to the passage of sewer air through the house drain, its use renders the ventilation of sewers more difficult and costly.

This contention raises the whole question of the ventilation of sewers, on which much time has often been spent, and many papers written and discussed. We are all of us acquainted with the difficulties which surround this subject, and the committee have evidently been thoroughly aware of these difficulties, with which they deal at some length, and it is interesting to observe that on page 41, paragraph 119, they state:—

"Too much importance has been attached to the question of sewer ventilation, for there is a considerable amount

of evidence which indicates that the necessity for ventilation of sewers has been exaggerated."

In connection with this, Mr. Boulnois pointed out that at the Sanitary Congress at Dublin in 1884 he read a paper called "Isolation versus Ventilation," in which he endeavoured to point out that the practice of openings in the streets for the so-called purpose of ventilation of sewers then in vogue was unsatisfactory and unnecessary, and that it was more important to isolate the house "by means of simple and effective traps" than to make these openings in the sewers, and that all that was needed, if this were done, was to erect a few "relief pressure shafts" at proper positions on the sewer.

A chronological list was given of different methods suggested or tried for the purpose of ventilating sewers from the year 1840 to 1884, and it is interesting to note that in regard to the year 1882:—

"Mr. Read, the surveyor of Gloucester, suggested that all house drains should be used as upcast shafts to ventilate the sewers, for he argued that as the sewer was used for the benefit of owners of house property, so should they contribute to the ventilation."

Which shows that even twenty-eight years ago the question of the advantage of the intercepting trap was doubted.

The Departmental Committee's report goes very fully into this question of ventilation of sewers, and arrives at the following conclusion:—

"If, therefore, the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection."

Mr. Boulnois said he personally agreed with this conclusion, though no doubt the advocates for the abolition of the trap may have many arguments in favour of the free ventilation of sewers through the house drains as being the solution of the problem.

It is contended by many persons, and the report also deals with the question, that the presence of the trap in the house drain containing sewage, often in a state of decomposition, largely contributes to the formation of gases and offensive smells in the sewer, and there is some considerable weight in this contention if it can be shown that a house drain, without an intercepting trap, would never contain decomposing sewage.

No. 2.—It is contended that the fresh-air inlet necessitated by the provision of an intercepting trap often acts as an outlet for foul air and creates a nuisance.

This contention is supported by considerable evidence in the report, especially by Dr. Butler, of Willesden, who stated, *inter alia*, that diphtheria had prevailed in his district, more over a series of years in areas where the intercepting trap is universal, than in other areas where the trap was absent.

The report says (page 3, paragraph 10): "With few exceptions the evidence was unanimous that the inlet is an objectionable feature of the house drainage system," not only as an outlet for smells, but also as being sometimes responsible for blockage of the trap through earth and detritus getting into it.

The committee, moreover, were not sure that a fresh-air inlet is essential for an intercepting trap, and they quote some experiments made by Mr. Steele in support of this contention.

All would agree that if the fresh-air inlet is placed in an inappropriate position it may at times become a nuisance by acting as an outlet for drain air instead of as an inlet, even if provided with a mica flap; but even if this is so, it may be argued that a smell coming from this inlet indicates that there is "something wrong" with the drain which requires remedying. In other words, the fresh-air inlet becomes a useful "detective." The remedy, also, if a remedy is required, would appear to be that of placing the mouth of the inlet in such a position that, even if it did act as an outlet, it would be harmless.

No. 3.—It is contended that the provision of a trap and its companion ventilation of the house drain increases the cost.

This is obvious, and the report does not deal with this question beyond stating it as a fact. It is not of much importance, for if the trap is really required the question of cost need not be considered.

No. 4.—The final indictment, and that which is of the greatest importance, is that the intercepting trap "forms a serious impediment to the passage of sewage from the house drain to the sewer, and that this frequently results in more or less complete blockage of the drain."

It was this alleged blockage by the presence of traps in the house drains at Willesden that first called the attention of the Local Government Board as to whether the intercepting trap was not more of a danger to the occupiers of a dwelling-house than a safeguard against the intrusion of the air from a sewer. The whole trend of the report is in the direction of proving that this indictment is correct, that such blockage may, and does, often occur by reason of the trap failing to clear itself, and that this objection causes a greater danger to health than the possible admission of sewer air into the house drains.

The contentions by the opponents of the intercepting trap in this respect are:—

(a) That it is always a positive obstacle, and is never clean;

(b) That it is the main cause of the blockage of house drains, with all the attendant evils;

(c) That it contains sewage which, under certain circumstances, is in an advanced stage of decomposition, and is the chief cause of bad smells in the sewers;

(d) That the primary object of good drainage, viz. to get rid of the fouled water expeditiously, is defeated;

(e) That it is, at best, an insufficient safeguard, liable to be forced by air pressure at any moment;

(f) That it forms no obstacle to the passage of rats;

(g) That the supposed dangers of sewer air have been greatly exaggerated.

With regard to these indictments the report contains some exceedingly interesting evidence, and the results of careful investigations and experiments.

The report gives the results of the systematic examinations by Dr. Butler of intercepting traps in his district, which show a total number of blocks of 3.7 per cent. of the total drain inspections. In addition to this the committee caused examinations to be made of traps in other districts throughout the country, with the result that of the traps examined 6.9 per cent. were found to be blocked at the time of examination, and 16.2 per cent. "gave evidence that at one time and another they had been blocked sufficiently to cause an accumulation of sewage in the inspection chamber." The total number of traps either blocked at the time or indicating previous blocks amounted to no less than 23 per cent. of the total traps examined for both purposes.

But this is not all. Mr. Patten Barber, the Borough Surveyor of Islington, carried out a series of exhaustive trials in order to ascertain what amount, if any, of the solid matters, usually flowing in a house drain would be retained in an intercepting trap, placed in the usual manner upon a house drain. These experiments showed conclusively that with every class of trap he tried (seven in number) more or less solid matter was always retained in the trap. In some cases this amounted to from 42 to 49 per cent. of the solid matters, and in others from 73 to 78 per cent.

If it were not for these experiments, it might be argued that some, if not all, the blockages might have arisen from one or other of the following causes: the improper fixing of the trap, the choice of an improperly designed trap, the insufficient fall of the house drain; or, from its size, the admission of some foreign matter into the house drain; or from some other cause for which the intervention of a trap *per se* was not responsible; but in view of Mr. Barber's experiments, which appear to have been carried out with great skill and care, these arguments appear to be inadmissible.

It may, of course, be argued that the two-gallon or even the three-gallon flush is insufficient to keep the trap or even the house drain clear of obstruction.

In this connection Mr. Boulnois mentioned that about fifteen years ago he carried out some experiments with house drains, laid at similar gradients to those in Mr. Barber's experiments, which conclusively proved that such flushes were insufficient to clear a drain (laid without any trap), except by many successive flushes. It was very interesting to observe how it required flush after flush to induce the faecal or other solid matter to move a few inches at a time in a drain, and it showed that until there was sufficient obstruction to raise a slight "head" of water on the obstruction itself it remained immovable.

If this was so in the drain itself, we can quite understand that there must arise at times a considerable accumulation in the intercepting trap. It is not stated if Mr. Barber found the same difficulty in moving the solid matter in the drain itself when carrying out his experiments. If there is this difficulty in keeping the house drain clear of deposit, the indictment against the trap, that it is one of the principal

causes of foul smells in the sewer, must be greatly modified, as the drain itself becomes a greater contributor.

The remedy, if the trap is to be retained, appears to be either that a larger flush of water is necessary or that the drain must be laid with a steeper gradient, or that the design of the present trap must be altered.

Mr. Barber's experiments go to show this, for whereas a 4-in. trap, "No. 4," retained 79 per cent. of solids, an "experimental" trap he tried only retained 8 per cent. of the solids, and this after ten experiments, in which on six occasions no solids whatever were left in the trap.

With regard to the possible forcing or unsealing of an intercepting trap by air compression in a sewer, the committee deal with this question at some length, and refer to the Bristol experiments. They come to the very proper conclusions that

"When a trap is forced by pressure the water seal, though reduced in depth, is not liable to be destroyed"; and they further state

"On the whole, therefore, it would appear, according to the evidence presented to us and according to our own experimental observations, that under practical conditions the intercepting trap usually answers its purpose as a barrier to the passage of air from the sewer into the house drain."

With which conclusion one can cordially and entirely agree; it is well known that air will always take the least line of resistance.

As to the passing of rats through a trap, the report states that in the opinion of the committee it is doubtful whether the trap is a barrier, and they give two instances of chased rats seeking refuge through traps into house drains. In the cases quoted it would appear that the rats were actuated by fear, and that in order to escape they preferred a bath to sudden death. The trap, however, is a barrier to rats under normal conditions, and they will not pass through the water in a trap except under some dire pressure. It is evident that rats, like sewer air, will take the least line of resistance.

One of the most important investigations of the committee is that of the chemistry and bacteriology of sewer and drain air, on which considerable time and thought appear to have been devoted.

The conclusion to which the committee arrived is as follows:—

"The results obtained by these observers are practically identical, and they indicate that in sewers, whether old or new, ventilated or unventilated, in which sewage is moving and is not lying stagnant, the air differs but little from that of the atmosphere outside."

Carbon dioxide was only found to the extent of from 17 to 20 parts per 10,000 as compared with 3 or 4 parts per 10,000 outside, the excess of ammonia and organic matter was almost negligible, and the sewer air was free from any appreciable trace of methane or carbon monoxide, and if present must have been due to the admission of coal gas.

Sulphuretted hydrogen also, they state, is not present in the air of sewers. In some sewers, notably at St Helens, Lancashire, this gas is found, due to the nature of the trade effluents discharged into the sewers, but, of course, this is a rather abnormal case.

Dr. Haldane, however, has found that this gas is given off in considerable quantity "from the traps of house drains in which sewage is apt to be retained, such as large grease traps."

This evidence by Dr. Haldane is another serious indictment of the trap, although in this case he refers specially to "large grease traps."

With regard to the smell of sewer air, which is evidently not due to sulphuretted hydrogen, but more probably from "the presence of minute quantities of a variety of volatile substances," the report says, "it is doubtful whether the smell of sewer air is usually more offensive than drain air," and that "untrapped waste-pipes or sinks and lavatories discharging into the open air" may cause a "serious nuisance."

The committee are further of opinion that the effect of smell on the human body may not only be repugnant, but that "there seems to be no reason to doubt that it may produce definite ill-health."

With regard to the bacteriology of sewer air, they made many investigations, and, *inter alia*, they say:

"The bacteriology of sewer air has been the subject of many investigations, and in one respect the results obtained have been practically uniform—namely, in showing that notwithstanding the immense number of microbes in sewage, the number to be found in sewer air is extremely small."

Further, they say that

"It seems also clearly established that not only the bulk of the bacteria of sewer air are derived from the atmosphere, but also that bacteria of sewage origin—that is, those that may be pathogenic—are very rarely present in sewer air, and that, when their presence can be detected at all, their number is very small."

They then deal with the bacteriology of drain air as distinguished from sewer air, and they arrive at the conclusion that there are more microbes in drain than in sewer air, and that this is mainly accounted for by "splashing," which occurs in the passage of sewage in a house drain, "especially when falling from a height or passing through a trap." This makes a further, and rather unexpected, condemnation of the intercepting trap, and it is difficult to see how splashing could be prevented in a soil-pipe unless it were made in the form of a spiral, and even then there would be some splashing. The question of the possible passage of microbes from sewers into drains is dealt with at very considerable length, and altogether no less than fourteen pages of the report are devoted to these questions of the chemistry and bacteriology of sewer and drain air.

The conclusions at which the committee arrive are as follows:—

"The results of these experiments emphasise the point to which we have already referred—namely, that the bacteriological evidence indicates that if any bacterial danger exists at all in house drainage, it is to be found in the drain air that may escape from the outlets of ventilating shafts of house drains. But even this danger requires to be regarded in its true perspective, as we have pointed out."

The paragraphs here referred to are of considerable length, and apparently refer to the important point as to whether disease germs from a neighbouring house can find their way through an untrapped drain into the house in question. This seems to be the crux of the whole question. The object of the intercepting trap, as I have always understood it, is to sever, or isolate, the house from the joint drainage of other houses in order to secure safety from possible infection from other houses.

It would appear from this important report that it is extremely doubtful if this result has been obtained, and that, notwithstanding the numerous legal cases that have been fought and won on the question of sewer air entering houses and causing disease and even death, we are now told that drain air is more dangerous than sewer air, and that the intercepting trap is not only a delusion and a snare, but that it is a positive danger to the health of the inhabitants owing to its liability to choke, the accumulation of sewage which it holds, the germs which it emits, the splashing which it causes, and its interference with the proper ventilation of the sewers.

To those who have been brought up in the belief that great reliance was to be placed on the proper trapping and pneumatic severance of a house drain, this report is bound to shake our faith, for in view of the evidence that was laid before the committee, and the care with which they carried out their investigations, we are bound to accept the conclusions at which the committee have arrived.

In connection with this vital question, and in conclusion, it is very interesting to refer to a book published in the year 1898 by Mr. Alfred Roechling, M.Inst.C.E., a Fellow of our Institute, entitled "Sewer Gas and its Influence upon Health," in which the author deals with the question of sewer air and its dangers, and he gives a number of quoted cases in which sewer air had been held by the Court to have produced disease, and even caused deaths.

ROYAL SOCIETY OF PAINTERS IN WATER COLOURS.

THE Winter Exhibition of the Royal Water Colour Society is now open to the public at the Galleries in Pall Mall East; it is the one hundred and fifty-ninth in series, and before closing on the 19th of next month it will doubtless and deservedly be visited by countless numbers of interested spectators. For it is an Exhibition that appeals by reason of the large proportion of earnest work. Was it not Miss E. T. Fowler who wrote, "It is aspiration which counts, not achievement; pursuit, not realisation; quest, not conquest"? Here, however, we are glad to recognise achievement, realisation and conquest.

The President (Sir E. A. Waterlow, R.A.) is well represented by a dozen works, of which it will suffice to refer to the following: "St. Margaret's Bay" (No. 9) is altogether delicate, and the mingled blues, greens, and lilacs depicted

on the briny waters are realistic. A companion to this, both in quality and style, is "A Chalk Headland, St. Margaret's Bay," and other meritorious compositions are "The Farmhouse" and "A Sussex Watermill"; but a presidential and exhibitional gem is "The Ford," wherein we find in happy conjunction breadth, brightness and atmosphere. The Vice-President (Mr. Alfred Parsons, R.A.) shows three works, of which "The Elder Tree" is distinctly pleasing, and in "The Winding Path" more than a word of praise is due to the basket of flowers. Ten pictures are contributed by Mr. Arthur Hopkins; "Willapark Head, North Cornwall," is vigorous, and "Merlin's Cave, Tintagel," though not equal in merit, is certainly to be noticed, whilst "Lye Rock, Bossiney Bay," is prettily touched in. "Sunset, North Devon," too, is most effectively portrayed.

Mr. W. M. Hale is one of the satisfactory executants in works such as "Newlyn Harbour—Sunrise," "Moonrise, Lago Maggiore," and "Pendennis Castle," the last-named being excellent in warm sepia. One of the most prolific contributors is Mr. Herbert Marshall, with his fourteen canvases, though he does not touch the high-water mark reached by Mr. E. R. Hughes, who has a similar number on the walls. However, Mr. Marshall exhibits very good work in "Off Billingsgate," where the rêve effect is prominent; and "Leicester Square," haunted by the artistic ghosts of Hogarth and Reynolds, draws attention through its own intrinsic merit, irrespective of the sublime shades. "Old Church, Dort," is a pretty little piece, but when we regard "Cannon Street" we regard cardboard. Mr. Hughes shows work varying both in class and quality; his Iona Abbey pictures would be better if the hue of the stonework were less green. Is it he or we who are perchance colour-blind? His portraiture merits the highest commendation; both technique and limning are charming, as shown in "Mrs. T. Matheson," "Josephine Tanner," "Kathleen Mendleson," "Dr. H. Mills," and others.

Mr. R. W. Allan has evidently bathed in Phœbus' rays, "Mentone" being redolent of sunlight, and showing also plenty of human interest; "Perugia" is, perhaps, the best of his exhibits, whilst "Brixham" is very hard and clean-cut, the only pleasing detail being the nearer small boat; "The Church of the Holy Sepulchre, Jerusalem," is quite suggestively correct, but fails to satisfy in its entirety.

Of the work of Mr. Tuke, A.R.A., attention need be drawn only to "The Fountain," with its characteristic figure, but the treatment is somewhat rough. Mr. J. J. Hardwick's fruit and flowers are delightful, as witness "Primroses," "Red and White May," and "Plums," the bloom on the fruit in the last-named being touched off to perfection. In "The Lace Shawl" Mr. J. Paterson, R.S.A., shows a well-modelled head, but his "Caerlaverock Castle" and "Summer in Skye" do not prove attractive. Commendatore Walter Crane has eleven exhibits, of which "Under the Moon," "In a Beech-wood" (a little gem), "A Forest Path," "A Window of the Wood," and "The Path to the Sea—Danish Coast" are delightful, the last-named in neutral, but not dull, tones. But some of Mr. Crane's work we should not have known to be his, such as "A Deer Park" (where the antlers seem exaggeratedly large), "An Aviation Meeting" (showing no evidences of Walter Crane's or anyone else's art), and "Girl Gardeners, Denmark," which is most uninteresting.

Mr. T. M. Rooke has some good work; "Ely—from the Meadows" is a pretty piece, and is preferable to the larger scale picture of the south-west angle of the cathedral, painted for the Birmingham Municipal Art Gallery, the station-point in the latter being taken too close to the subject; but with the technique we have no quarrel. "Via dei Bardi, Florence," shows a narrow thoroughfare between relatively high buildings, and is commendable. "The Ambulatory, St. Bartholomew's," we have already seen in the Fine Art Palace at the White City, and we are not attracted by it, for it is out of drawing. We cannot congratulate Mr. Hughes-Stanton on his work, which looks crude and elementary; contrast, for example, "Morning, Equihen, France," with the President's "A Chalk Headland, St. Margaret's Bay." The late Mr. Clarence White is represented by some admirable work and by some less admirable; of the former we may mention "Sunshine and Shower," "Snow in Llanberis Pass," and "A Snowstorm on Snowdon." The sketches at Antibes and Chabéry by Mr. J. Parker are, generally speaking, good, "The Fort, Antibes," being specially noteworthy. Mr. Lamorna Birch's work is not greatly attractive; it is somewhat thin, sketchy, and perhaps even crude in places. "The Golden Sun" shows a tendency towards the aujourd'hui touch, which is to be deprecated.

Of Mr. J. C. Dollman's pictures we can notice but two; "Underhill Lane, Ditchling, Sussex," and "Circe" are both attractive in their several ways. The latter deserves special notice for its composition and colour scheme, the group of leopards being very good. Mr. Charles Gregory shows work to which none in the Exhibition is superior; "Gardens at Guildford," "A Guildford Bywater," and "The Mill Basin at Guildford" are perfectly charming, but "A Surrey Common" is finicky in touch, lacking breadth of treatment.

Mr. R. Thorne-Waite deserves commendation for "The Way to the Mill" and "The Sussex Downs," but as much cannot be predicated for "Thunder"; in all he has eleven exhibits. We are much afraid Miss Clara Montalba is passé, for of her half-dozen canvases there is not one which appeals to us for its qualities, or which seems to recall past work from the same brush. Mr. Napier Hemy, R.A., is well represented by characteristic work. We must notice Mr. Smallfield in order to draw attention to the absurd affectation of "Still Waters" and "Sleep on the South Downs," where each of these small panels is filled up by a face, leaving no room for scale background. Mr. Sims, A.R.A., is represented by crudity, and one can but marvel that such a piece as "Swallows" should find a purchaser; fortunately, however, for artists, tastes differ. Mr. R. Barratt has some very pleasing Venetian work, "By the Clock Tower" and "The Flagstaff of St. Mark's" being specially commendable. "The Dorsetshire Coast, near Lyme Regis," by Mr. W. E. Walker, is very brightly touched in. More we would like to notice, but for lack of space we must rest content with expressing warm approval of Mr. Bulleid's work, which is an improved edition of Alma-Tadema; and, finally, we would commend Mr. H. Henshall for his vigorous brushwork and warm colouring.

Other work there is plenty, both meritorious and otherwise, the whole effect of the Exhibition being entirely satisfactory.

OUR CONTEMPORARIES FROM OVERSEAS.

Deutsche Bauzeitung (Berlin) has further views of the pair of buildings forming the new Royal Court Theatre at Stuttgart, and also illustrates the Wertheim palace-shop at Berlin.

Het Huis (Amsterdam) contains further views and description of Old Zwolle, and an illustrated account of the church of St. Eusebius at Arnheim.

Stone (New York) exalts in the displacement of wood pavement by granite setts under the stress of our modern motor traffic, and points another lesson on concrete failure by reference to the disaster at Kansas City. Excellent illustrations are given of the interior of San Vitale, Ravenna, and of San Giovanni in Laterano, Rome.

Engineering Record (New York) gives a report of an investigation of the effect of wind pressure on the walls and roofs of buildings, with special reference to the suction effect on the leeward side by Professor Albert Smith, of Purdue University. Another interesting paper on the "Importance of testing sands" is contributed by Cloyd M. Chapman.

COMPETITION NEWS.

BRADWELL.—The Joint Isolation Hospital Committee have decided to throw open to a limited competition the work of preparing a scheme for the proposed enlargement of the hospital. Dr. Reid, the county medical officer, will nominate an assessor. Architects practising within a five-mile radius will be eligible to compete.

GLASGOW.—One hundred competitive designs have been received in the Municipal Buildings Extension competition, and the assessor, Mr. John J. Burnet, LL.D., A.R.S.A., is now engaged in selecting from these the six designs whose authors are to be invited to join in the second competition.

TYNEMOUTH.—The local Education Committee last week adopted the following recommendation: "That a junior mixed department, to provide accommodation for 480 junior infant children, be provided at the King Edward School site, and that two new school departments, to accommodate 450 senior mixed and 400 junior and infant children respectively, with caretaker's house, be planned for the Spring Garden School site, but that accommodation for 300 senior mixed and 150 juniors and infants combined be provided at present." It was further resolved to advertise for an architect or architects, living or practising within a radius of twelve miles from North Shields, for the erection of one or for two new elementary schools.

FORTHCOMING EVENTS.

<i>Saturday, November 23.</i>	
Royal Sanitary Institute : Provincial meeting at Doncaster, discussion on "Town Planning in Relation to the Development of the South Yorkshire Coalfield," to be opened by Dr. A. B. Dunne, at 11 A.M.	
<i>Monday, November 25.</i>	
Architectural Association : Paper entitled "The Prosaic in Architecture," by Mr. Horace Cubitt, A.R.I.B.A., P.A.S.I., at 8 P.M.	
Surveyors' Institution : Paper on "Land Values Taxation," by Mr. E. M. Konstam, barrister-at-law, at 8 P.M.	
<i>Tuesday, November 26.</i>	
Royal Society of Arts : Paper entitled "The Hardwood Timbers of New South Wales," by Mr. W. H. Warren, LL.D., M.Inst.C.E., at 4.30.	
<i>Wednesday, November 27.</i>	
Edinburgh Architectural Association : Associates' meeting, Demonstration in Ironwork, by Mr. T. Hadden, at 8 P.M.	
Institution of Municipal Engineers : Joint Southern and South-Eastern District meeting at 4 Southampton Row, W.C., at 8 P.M.	
<i>Thursday, November 28.</i>	
Sheffield Society of Architects' Students' meeting, Paper entitled "A Visit to Bath," by Mr. J. C. P. Toothill, at 7.30	
Concrete Institute : Paper entitled "Bills of Quantities for Reinforced Concrete Work," by Mr. J. M. Theobald, F.S.I., at 7.30 P.M.	

NORMAN SHAW.

THE death of Mr. Richard Norman Shaw, R.A., last Sunday has removed from amongst us the last of the great personalities in the architectural profession of the Victorian Era, and amongst his contemporaries there is scarcely one who has had a more widespread and lasting influence, not only upon the work of his immediate worshippers and imitators, but upon the history of English architecture during modern times.

It is not going too far to say that the present position of English architecture in domestic work is unquestionably due to the example and influence of Norman Shaw. He it was who showed that it was not only possible, but desirable, that every house should have an individual character of its own. In his London houses, Lowther Lodge, Queen's Gate; Swan House, Chelsea, no less than in his country mansions, Wispers, Dawpool, Chesters, Cragside, and others, there is a differentiation of treatment that we may attribute to a desire for characteristic expression as much as to a display of the artist's versatility.

It has been said that Norman Shaw was essentially a Gothic man and incapable of completely understanding the merits of Classic treatment. This statement we have always held to be unjust to the character of a great artist. On occasion he could produce as symmetrical and formal design as the strictest adherent to the principles and regulations of Palladio, but he recognised with truth that it is but rarely that the English country house should be formal in character. When the occasion seemed to him to require formality, as at Lord Portman's, it was provided, but the picturesque rather than the formal is undoubtedly more in consonance with the tradition of the English home as well as with the environment in which it is most often placed, and there can be no question that Norman Shaw's country houses ever seem to be not only in harmony, but in unison with their surroundings.

The greatest lesson that Norman Shaw taught to architects of the nineteenth century was this necessity of harmony between the house and its environment, and the influence of the lesson has been exercised until the present time, although there is unfortunately amongst some of our young designers a tendency to forget the lesson and to suppose that rough-cast is always and everywhere a suitable material. No doubt this is the result of a conviction that rough-cast is easy to design and cheap to build.

Norman Shaw's greatness is evidence to our young men that if they would attain to a high position and worthily uphold the dignity of their art, the last thing they must think of is easy design. The master's work never suggests that it has ever been influenced by a desire to save trouble, and neither does it give evidence of laboured endeavour.

Norman Shaw was one of the first to see the capabilities of the sympathetic use of material, and in so doing gave the direction which may almost be described as a turning point in modern English domestic design; a direction which has been followed by numerous workers, not only amongst Mr. Shaw's own personal pupils, but including very many other designers both in this country and in the United States of America.

Although Norman Shaw was, in common with most of the men of his generation, an ardent student of Gothic architecture, as is evidenced by his "Architectural Sketches from the Continent," published in 1872, he must be esteemed as the one personality who did more than any other to turn the course of modern English architecture from Gothic to Renaissance methods of design.

His New Zealand Chambers in Leadenhall Street was a startling revelation to his contemporaries, and led the way for the adoption of the so-called Queen Anne style which was really a modification of English Renaissance tinged with Gothic feeling.

It was inevitable that the study of English Renaissance, even through Gothic spectacles, should in time lead to a more thorough comprehension and even to a more strict adherence to the principles and methods of Renaissance work not only of the English type, but also Italian, French, German, and Spanish.

The picturesqueness which he found to be essential in the designing of country houses naturally tinged Norman Shaw's designs when he made use of Renaissance forms of detail as his means of expression, and it is therefore due to a feeling for the picturesque that we have the freshness of his design for the Piccadilly Hotel. He has taught the lesson that formal composition does not connote coldness or tameness; that it is possible to design a perfectly symmetrical building which shall nevertheless possess piquancy and even playfulness of mass as well as of detail.

One example which Norman Shaw has set has not attained any considerable amount of recognition, except that of condemnation by critical purists. We allude to his daring departure from recognised canons of construc-

tion, as, for example, his balancing of a pair of walls enclosing a corridor on one wall midway between them at Lowther Lodge; the projection of the front of Swan House, Chelsea, seemingly suspended like Mohammed's coffin between earth and heaven, or the support of the main wall of the Piccadilly Hotel on girders so as to obtain his desired depth for the column, and yet in all these departures from logic and convention have we not rather the boldness of the master-artist taking advantage of the benefits that modern engineering construction afford to the architect who is bold enough to overstep the limits of precedent?

Mr. Shaw showed himself a pioneer also when at Bedford Park, Chiswick, he proved that architecture and artistic design were as desirable for the small house as for the mansion, and in this instance he may be said to have initiated the idea of the garden city and the garden suburb in so far as their aim and intention depend upon architecture as well as upon gardening. The gardens alone would not have seized hold of the popular imagination to the extent that combination with the artistic design of the house has done.

Mr. Norman Shaw's influence was exercised not only by his buildings, but by his draughtsmanship, which was of a very high order, and his productions were eagerly looked forward to in the Architectural Room of the Royal Academy year by year. In common with others of the great Victorians he undoubtedly exercised a tremendous influence on architectural draughtsmanship, and was in no small degree responsible for the high degree of excellence to which it attained at the end of the nineteenth century. Not only in the Architectural Room, but in the Architectural School of the Royal Academy Norman Shaw exercised a powerful influence in the actual training and education of those who were fortunate enough to be allowed to study under his direction, and this personal influence was still more strongly exerted on the arted pupils in his office, many of whom have made honoured names for themselves amongst the architects of our own time, and have further extended the influence of the lessons that their master taught as much by practice as by precept.

It must not be forgotten in the appreciation of Mr. Norman Shaw that, although his predominance was in domestic architecture, he has nevertheless given us not a few examples of ecclesiastical work which show that his early study and thorough comprehension of Gothic principles and detail were worthily applied in the service of the Church, for whom he produced designs that while redolent of knowledge were never archaeological, but always infused with a personal feeling of individual artistry.

Above all things it must be recognised that Norman Shaw was an artist of the first calibre and a great architect because he added to this quality the ability of a practical constructor and of a good man of business.

NOTES AND COMMENTS.

A FULL-PAGE advertisement in the *Times* is an anticipatory counterblast to the reports of the two Departmental Committees nominated by the Home Office to investigate the dangers to health arising from the use of red and white lead. There has now been for some time no doubt that the conclusions of the Committees would follow closely those arrived at by the French Government, to the effect that the dangers to health inevitable from the use of red and white lead are so serious that their use should be greatly restricted.

It is clear from the advertisement that the assertions therein made are put forward in the interests of the manufacture of red and white lead, and one must therefore regard the cry of "national importance" as on a level with that of the silversmiths of Ephesus.

The advertisement suggests that the reports of the Committees will result in the imposition of arbitrary restrictions affecting the use of articles indispensable to

every household, and it is definitely stated that "powerful financial interests are at work to secure the total suppression of red and white lead in the interests of various substitutes, mainly of foreign origin," and charges of incorrect procedure are made.

It is charged, firstly, that the inquiry has been carried on behind closed doors. We believe that this is usually the practice with regard to Departmental Committees, and in many cases is desirable in order that evidence may be given which it would be impossible to obtain if the conduct of the inquiry had been carried on in the full light of day. The second charge is that "those who advocated the continued use of red and white lead and those who advocate prohibition were allowed no opportunity of hearing or rebutting the contentions put forward by their opponents." Here, again, the departmental inquiry is an endeavour to arrive at the truth, not a public trial of the ingenuity and ability of counsel and expert witnesses. The third charge is that "a number of eminent foreign scientists and business men were invited to tender expert evidence," and that "they affirm that they have been brow-beaten and discredited; that they have been treated as hostile witnesses are treated by an aggressive cross-examining counsel." We presume that those who have drawn up this advertisement are voicing the views of expert witnesses on their own side, and inasmuch as expert witnesses are more often than not advocates, it is necessary that they should be cross-examined, and we have no doubt that the witnesses who appeared on the other side have been impartially so treated and tested by the Departmental Committees.

It has for some time past been understood, as we have indicated on more than one occasion, that the reports of the Departmental Committees would be unfavourable to the future unrestricted use of red and white lead, and, however much we may sympathise with the chagrin of those who are engaged in the manufacture, we can but recognise that it is hopeless to expect at this time of day that the vested interests of the few will be allowed to militate against the health of the many. For our part we are quite content to wait and accept the report of the Departmental Committees as at any rate the honest expression of opinion after careful investigation and consideration of all available evidence.

Another ancient ship has been discovered in the bed of the Thames at Woolwich in connection with the extension of one of the Borough Council's electricity stations. It appears that there is a tradition of a vessel having been sunk in the Thames near this spot in the reign of Charles I., and the remains now found may possibly belong to that vessel. It would not, at any rate, be correct to argue against the possibility by reason of the good state of preservation of the oak of which the wreck is constructed. Far more ancient remains dating back to the time of the Vikings show the remarkable durability of oak buried underground, and in comparison with these latter the present finds are quite modern.

The loss which Rotherham is now lamenting of a cart-load of Roman remains which had been stored away in the cellar of the Mechanics' Institute, now the property of the Rotherham Corporation, is almost incredible, and attention has been drawn to them by Mr. Freemantle in a lecture on "The Call of Templeborough, a Roman Station," to the Hunter Archaeological Society at Sheffield University. We wish Mr. Freemantle and his friends success in the establishment of the "Templeborough Purchase and Exploration Fund of 1912," by which they hope to carry to a successful conclusion the excavations which were started and abandoned some thirty-five years ago, some of the results of which were the missing Roman remains.

The Rural Cottages Bill, introduced by Mr. Stanier with the support of Mr. Jesse Collings and other Unionist M.P.s, seems to be an earnest endeavour to solve one of the greatest difficulties in connection with rural

BLYTHBURGH CHURCH, SUFFOLK.—From a sketch submitted for the Pagin Studentship, 1912, by Mr. A. M. DURRANT.

housing, and has for its matter an application of the nation's credit to enable owners of land to build cottages which can be let at a rent not exceeding two shillings a week. The rural district councils who are under less favourable circumstances than actual land owners are to be assisted to build and let cottages at a rent not exceeding half a crown a week. Other provisions in the Bill enable tenants to buy their cottages on particularly easy terms. It is proposed that a housing department shall be established at the Local Government Board, with finances provided by an annual rural housing grant up to £200,000.

We regret to have to record the death of Mr. Edward Blakeway I'Anson, M.A., for the following particulars of whose career we are indebted to the *City Press*:—He carried on a professional practice commenced by his grandfather over a hundred years ago and continued by his father, the late Mr. Edward I'Anson, of Grayshott, who was for many years the Surveyor to the Merchant Taylors' Company, as well as a Liveryman of that Guild. It is remarkable that the practice has always been carried on in the same building—an old-world mansion erected soon after the Great Fire of London. Mr. E. B. I'Anson's death occurred on Sunday at his house in Argyll Road, Kensington, and he was 69 years of age. He joined the Merchant Taylors' Company by patrimony in 1874, and filled the Master's chair in 1901-2, being still on the Court at the time of his death. He was also a Liveryman of the Gold and Silver Wyre Drawers' Company. Mr. I'Anson was the surveyor to St. Bartholomew's Hospital and to Charterhouse, and the architect of many notable buildings, among which may be mentioned the London Commercial Sale Rooms in Mincing Lane, the recent extensions of St. Bartholomew's Hospital, the offices of the General Steam Navigation Company in Trinity Square, the mansion of the Lord Chief Justice at Cranleigh, the Public Libraries at Newington and Clapham, the Cottage Hospitals at Finchley, Broseley, and Much-Wenlock, a Convalescent Home for Llandudno, and the Hospital Convalescent Home near Swanley Junction, Kent. In addition to being a Master of Arts of Cambridge University (having graduated at St. John's College), he was a Fellow and past Vice-President of the Royal Institute of British

Architects and of the Surveyors' Institution, being also a vice-president of the latter at the time of his death.

NOTES ON BOOKS.

"A Digest of Law relating to Arbitrations and Awards," by H. Foulkes Lynch, Solicitor. Fifth Edition. By A. R. Randall, of the Middle Temple. (London: Effingham Wilson. 5s.)

When a book has reached its fifth edition it is evident that it has fulfilled a want, and all that is necessary is to draw attention to the fact that another edition has been published bringing the subject-matter up-to-date.

We have looked through it and think that anyone interested in arbitrations would find it a useful guide. The law is set out plainly and concisely, and the examples given are clear and to the point. At the present day the questions which arise during the course of arbitrations are not less numerous or difficult than in former years, and, in fact, it appears to us that the conduct of an arbitration is becoming more regular and defined than it used to be.

Certainly the old idea that the parties having elected their own tribunal are bound by that decision and that there is no appeal against an arbitrator's award is far from the fact, for, in our opinion, the preparation of an award is a matter where an arbitrator may very easily go wrong, unless he has special knowledge and experience, and quite lately the matter has been dealt with by the Court of Appeal.

All authorities thought that there was no means of appealing against a case stated for the opinion of the Court under section 19 of the Arbitration Act during the progress of an arbitration, but the Court of Appeal has recently upset that theory, and now it has been held that where a Divisional Court gives advice to an arbitrator upon a case stated by him, pending the arbitration proceedings, there is no appeal from the opinion of that Court, but where an arbitrator acting upon the opinion given by such a Court makes an award wrong in point of law upon its face, the Court of Appeal can set such award aside or remit it to the arbitrator, even although that involves saying that the law is different from that which the Divisional Court expressed it to be.

We do not find that the effect of this case has been stated in the volume before us, and have stated it not as in any way detrimental to the volume or the work of the author, but only to show that even when one has before them the latest edition of a book which is evidently carefully prepared and greatly used, it is well to consult the latest authorities on the subject to ascertain whether the law has been more recently explained.

"Reports of Rating Appeals heard before the London and other Quarter Sessions, the King's Bench Division, the Court of Appeal, and the House of Lords, 1909-1912." By E. K. Konstam and H. R. Ward, of the Inner Temple, Barristers at Law. (London: Butterworth & Co.)

This volume forms a continuation of the series in which the last collection of reports by one of the present editors (Mr. E. K. Konstam) appeared in 1908. In the present volume will be found reports of most of the rating cases of importance which have been decided in the Supreme Courts since that time, together with selected decisions of quarter sessions. The general arrangement is similar to that of previous volumes of the series, which are so well known that it is unnecessary to say more than another volume is added thereto containing the most important decisions on this particular subject in a form which is at once handy and reliable. It is a great comfort to have these cases on particular subjects collected and at hand rather than having to depend on various volumes of the different reports, and the reports are so full that they become useful guides both to the lawyer and valuer, as well as to the authorities on the various intricate questions which are constantly being brought before them.

"The Elements of Perspective. Illustrated by numerous examples and diagrams." By Aaron Penley, author of "The English School of Painting in Water Colours," "A System of Water Colour Painting," &c., &c. Revised and partly re-written by A. P. Killik, M.S.A., and D. B. Hedderwick. 1911. Forty-seventh thousand. (London: Winsor & Newton, Ltd. 1s.)

This little book explains clearly the general rules of perspective, but does not extend beyond the point indicated in its title—the elementary stage of the subject. It is, however, necessary before the student can attain to the higher branches of perspective that he should thoroughly understand the elements. There are many young draughtsmen who, having obtained only a rudimentary knowledge, find themselves confronted by awkward problems when they attempt to tackle the architectural perspective of a large or complicated building. The probability is that no book in their possession will solve the difficulty, and they will, therefore, have to be puzzled out without extraneous aid. The student who is thoroughly grounded in the first principles can usually manage to do this for himself; it is therefore important that he should have a complete understanding of the elements, and that he can obtain from this small volume. The edition before us is the forty-seventh thousand, which indicates that it has been found valuable by many generations of young draughtsmen.

"Builders' Quantities." By Horace M. Lewis, Associate Institution of Municipal and County Engineers. Member Royal Sanitary Institute, Lecturer on Builders' Quantities, Poole School of Technology. (London: E. & F. N. Spon, Ltd. New York: Spon & Chamberlain. 1s. 6d. net.)

It seems to us hardly worth while to produce a tiny volume such as that by Mr. Lewis with the idea of teaching anything valuable in regard to builders' quantities. The information given is insufficient for the absolute novice and superfluous for the expert or even the student of moderate experience, say six months in a quantity surveyor's office. The student who could not in that time learn a great deal more than this book teaches him will never be able to take off quantities.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary general meeting of the Royal Institute was held at Conduit Street on Monday last, the 18th inst.

Mr. Guy Dawber, acting in the place of the Hon. Secretary, said that it was his mournful duty to make the formal announcement of the long list of losses which the Institute has suffered by death since the closing meeting of last session. They included Sir Lawrence Alma-Tadema, O.M., R.A., elected Hon. Associate in 1877, Hon. Fellow in 1901, Royal Gold Medallist in 1906; Sydney Smirke, elected Fellow in 1888; Thomas Arnold, elected Associate in 1867, Fellow in 1904, placed on list of retired Fellows in 1904; George Tunstal Redmayne, elected Associate in 1872, Fellow in 1877, Retired Fellow 1902; Henry Hall, elected Associate in 1872, Fellow in 1887; John Thomas Bressey, elected Fellow in 1877; George Friend, elected Fellow in 1888; William Frederick Unsworth, elected Associate in 1882, Fellow in 1891; Francis Edward Masey, elected Fellow in 1901; Edward Blakeway I'Anson, elected Fellow in 1880; George Enoch Grayson, elected Fellow in 1886; Charles Henry Rew, elected Fellow in 1905; John Samuel Paul, elected Associate in 1886. Notices of all the above have appeared or will appear in the *Institute Journal*.

The following resolution was passed by the meeting: "That the Royal Institute of British Architects do place on record its profound sorrow for the loss it has sustained by the death of its distinguished and highly esteemed Hon. Fellow, Sir Lawrence Alma-Tadema, O.M., R.A., and do offer an expression of sincere condolence to his family in their sad bereavement."

The meeting also passed a vote of sympathy and condolence with the family of Mr. Sydney Smirke, whose generous contributions to the Institute library, extending over many years, were very greatly appreciated.

A similar vote of sympathy and condolence was passed to the family of Mr. George Enoch Grayson, who had been President of the Liverpool Architectural Society, and had served on the Council of the Institute and on the Practice Standing Committee; and also to the sister of Mr. E. B. I'Anson.

The Secretary announced that the following candidates have passed the Statutory Examination, and have been granted by the Council Certificates of Competency to act as District Surveyors in London: Sidney Walter Bensted, Associate; Benjamin Chaikin, Licentiate; John Docaston, Associate; and Lawrence Alexander David Shiner, Associate.

Mr. J. L. Ball then read a paper entitled

Bath: A Comparative Study.

Those who have much experience in directing the work of students will understand, he said, the difficulty of arousing in them a clear apprehension of the sensuous element in architecture, of that architectonic quality which is neither pictorial, nor sculptural, nor rhythmic, nor perhaps altogether structural. Each art has its own special phase of beauty, incommunicable in the other forms of any other. To discriminate in every species of architecture the essential architectonic element, to compare the various expressions of it, is the true business of the student. And this central secret can be penetrated only through a certain intimacy, by personal contact with the actual works. The supreme teacher of architecture is architecture itself. Its essential properties are properties of solids, hardness, weight, texture, actual size, fixed outlines. Photographs, and even drawings, of architecture, stereotyping as they do a single phase, are no true presentment of it; for a great work of architecture has a kind of personality, fluctuating with mood and circumstance, and can be realised only by those who ramble about its arcades, and who watch for its expression, not at high noon only, but in the twilight and in the morning.

The universal law is that art addresses itself to the senses, and only through the senses to the understanding and the imaginative reason. What is really important to the student is, not to get together a sort of mental compendium of architecture from representations of it, but to use all books, photographs, drawings, to sustain and reinforce the impressions which he himself has received from personal contact with the works themselves. To draw models in the abstract may perhaps be a discipline, but it is not the discipline of architecture.

It is as a Roman sanatorium—*Aquae Solis*—that Bath emerges from the region of fable. The remains of the baths—a small fragment only of the *thermae* which, with temples

and gymnasias, once covered more than seven acres—are nevertheless the most considerable relics of Roman architecture in Britain. From these vestigia the stature, even the features of Hercules may be inferred; we perceive the strength of the giant, and the coarseness. And so, wandering amidst ruined walls and fallen columns, all that we know of Roman architecture seems to acquire an instant reality.

It is not easy to explain the spell which Roman architecture casts over us, its defects are so obvious, its virtues less obvious. How different, we say, is this from the Greek, how inferior its spirit to the Greek spirit. Such conclusion is the result of bracketing together schools of architecture by superficial resemblance, and ignoring the deeper influence of temperament. The temperament of Roman architecture is not Dorian, is not Ionian, is not even Corinthian, it is Composite or Roman. The mixture of conflicting ideas is characteristic of it. What the Romans were always looking for was not perfection of any kind, but power. Nothing was rejected that might tend to make their architecture more flexible, more adaptable to all uses. For the first time architecture steps down from its lofty isolation as an art sacred to the temple and the palace, and becomes in a certain sense popular.

The coarseness, too, of Roman architecture is not an accident but an essential of it, a masculine grossness and predominance which also has a place in Art. This kept it free from the effeminacy which spoiled so much work of the Renaissance, and especially kept it true to a grand tradition of scale. It becomes really a sort of exaggerated emphasis of strength.

The ideals of the Roman people centred very much in the city; the ideal life with them was the urban life. They thought of architecture not principally as domestic nor as religious, but as civic; as the heritage of Roman citizenship and the emblem of Roman order. Therefore they laid cities out with a wise prevision, and adorned them with noble monuments.

The illustration of the Gothic phase has been left by Bath to Wells. Not the cathedral only, but the whole aspect of Wells, preserves the spirit of the Middle Ages. Nothing of this atmosphere exists in Bath, where the Abbey stands alone in a sort of priestly isolation, the last word of Gothic Art in a city of the Renaissance.

Bath Abbey was begun in 1499, replacing earlier structures, was partly ruined at the Dissolution, and partly rebuilt between 1597 and 1616. Thus it belongs entirely to the decadence of Gothic. That architecture which meets us at Wells Cathedral in the flush and animation of a wonderful youth, we find at Bath Abbey in the last stage of a no less wonderful decline; beautiful still, with the beauty appropriate to winter. In Wells Cathedral every line is intense with life triumphant, life contemning death. But in Bath, in this city of pagan memories, it is the pagan sentiment which finds expression in the last words of Gothic Art. In its rigid attenuated forms, from which fire and passion and energy have departed, we see the composure, the high indifference of death. We feel that the end is achieved; the fancy, the invention, the experiment of three centuries of Gothic Art, seemingly inexhaustible, have come by inevitable steps to this, and terminate here, in this chill perfection.

The Roman city, the mediæval city of Bath are gone, or survive only in profoundly interesting fragments. But the famous Renaissance city of the eighteenth century exists. We still walk the streets, still pass in and out of the buildings which are associated with a crowd of brilliant and attractive people, and with creatures of the imagination hardly less real. Quite apart from its historical associations, and from the literary fragrance which clings to it, this city has a real charm and distinction. And in speaking of the eighteenth-century architecture of Bath, said Mr. Ball, the work of Brydon in the nineteenth century must be included; for by the turn of his genius, and by his faculty of identifying himself with his subject, Brydon rivalled, perhaps excelled, his predecessors.

What is the precise value to us of the particular phase of the Renaissance which Bath presents? No architecture has been more absurdly praised, or more absurdly blamed; and it merits neither extreme. This vehemence is to be regretted, for it fosters the common notion that Art is a controversy of personal likes and dislikes. What should attract us in Art, what alone makes it really valuable to us, is the promise of life. We may conceive of architecture as reflecting certain broad and luminous aspects of life, some more imposing, others less, but all in their degree valuable as part of the general heritage of culture; and its

success will depend much more on the manner of the presentation than on the actual worth of the aspect presented. In Bath, the Renaissance of the eighteenth century has no claim to creative genius. It is the architecture of an age which was quick and critical, but not very imaginative or profound. It is part of the learned culture of its age; a culture which valued formula and hated eccentricity. It is the architecture of fine manners and courtly phrases.

In the eighteenth century the classic ideal in Art was a somewhat restricted one; their minds were attracted more by the one perfect expression, the one perfect outline than by the careless opulence of romantic genius. But the faults to which even great romantic art is prone—profusion, excess, lack of discipline—are precisely the faults which the classic ideal by its lucidity and restraint exists to chasten. Restraint, severity, the resolute exclusion from one's work of the superfluous, the crude first idea—what a secret of style is there!

So, then, in this Renaissance city of the eighteenth century the spirit of Roman decorum is revived; its streets and open places and the order of its public and private edifices were civic interests; and we have an architecture austere and sober, devoted to the classic ideal, and with little of the romantic in its mood. Yet a certain sterility marks it, as though some hidden influence were obstructing its development. On the whole there is a sleepy conformity to type, and if any considerable variation is essayed the variation proves degenerate; the constitutional defect of eighteenth century Renaissance being, in fact, a defect of variability. Gothic architecture, Wells Cathedral, for example, shows a readiness to exhibit variations from the normal which is really astonishing; we can imagine it capable of variation almost without limit.

The theory on which the classical Renaissance was based may perhaps go far to explain this defect in it, the theory that the progress of architecture depends on following, with scholarly attention, a perfect model; the perfect model here being the Rome of the Augustan age. But as architecture approaches perfection its variability decreases, and with that its usefulness as a model for practice decreases also.

But, though the classical Renaissance is limited in this way, it possesses the attribute of adaptability to any kind of requirement. Gothic, with all its abounding variability, its intense and flame-like imagination, is wholly without such adaptability. Hence the disaster of the last century—the effort to adapt the solemn architecture of the religious ideal to commonplace and secular uses.

Domestic architecture—architecture, that is to say, in which a definite sentiment or homeliness is expressed—belongs in quite a special sense to the Renaissance. Mediæval architecture had no place in the epic solemnity of its mood for a domestic quality. Whereas from the beginning the function of the Renaissance was to bring the influence of architecture into the home of the plain citizen, to give in terms of architecture an expression of the domestic ideal.

Mr. Mowbray Green, in proposing a vote of thanks, said that Mr. Ball had treated the subject in a very broad and masterly way, however much they might differ from him as to details and his conclusions. They might not all agree with the suggestion that the work of the Renaissance was, to give to the plain man some idea of architecture in his domestic life. The essence of the paper apparently lay in the words "adaptability" and "variability." It seemed to him (the speaker) that it was with the variability of the Renaissance that they should be mainly concerned. To his mind, the outstanding feature of Bath was the example it set in the development of a city. In the seventeenth century it was but a little place—practically nothing more than a Roman city measuring four hundred yards from wall to wall. That was an important point to remember if they would arrive at a just estimate of the achievement. Up to 1775 the local men had introduced a comparatively broad treatment in their frontages, though the type of Renaissance was debased. But no particular method had been definitely adopted. It needed a master mind to lay down the broad lines of development. An important point had been touched upon in the lecture in the comments on "scale." Mr. Ball was not alone in thinking that the Renaissance buildings of Bath were without scale. But perhaps the question of scale was explained by the desire of the designers to conform to the surroundings of the city, which only permitted it to develop northwards. Of the fine scale of the various long streets and squares there was very ample evidence. One example was Queen's Square, which measured 300 feet from side to side. The extraordinary thing was that as the

century progressed the scale of the lay-out became bigger and bigger. It seemed to him that to have overloaded Bath with buildings on a large scale would be depressing. To the intellectual environment of the city Mr. Ball did ample justice.

Mr. L. March Phillips, in seconding the vote of thanks, said he had never listened to a lecture which struck him as being more in accordance with the needs of the age. Mr. Ball had stated that it was the spirit of the Roman Renaissance which inspired eighteenth-century Bath. It seemed to him, however, that the Renaissance of Europe was composed all along the line of two streams—viz. Roman and Greek. Very often the forms used are purely Greek in their feeling. There was a process of sifting in progress all the time, and some architects were taken up with one and some with the other style. Wren, for instance, was Roman; the Adams were Greek. In Sheraton furniture, old Sheffield plate, &c., there were ideals which were certainly not Roman. The lecturer had made his paper very humanly interesting. It would be a good thing if writings of that kind could be distributed among the ordinary public, as then architecture would become for them a human subject. Architecture was now cut off to a certain extent from life. That was an enormous loss, both to life and to architecture. Not only did it cut off from life a subject of extraordinary interest and an art which after all gave everyone their home, but it cut one off from the life and labour of the people. Art was something more than the mistress art; it was the mistress industry. If you unite architecture with life you dignify life and labour. That, he believed, was going to happen. The whole subject of architecture ought to be suffused with life. If everyone got to think of architecture as the expression of the vital past of people then they would wish to make it an expression of their own lives also.

Professor W. R. Lethaby remarked that Mr. Ball had given them an extremely able paper. Bath was a wonderful city—perhaps the only city in England that has any architectural weight at all. What had struck him when there in the early part of this year was the fear that we do not value Bath sufficiently as a national asset. This generation had fine things given to them which they could not live up to. Euston Station was so good in its way that they did not know how to make use of it—the central hall was now simply a waste space. He would suggest whether it was not possible for something to be done for the better appreciation and maintenance of Bath. It cried aloud for something national to be done. Bath might well be a university town. Bristol was a most depressing town, which would blight the life of any young man who had to study there for five or six years. Personally he would just as soon think of setting up a university at Wolverhampton as at Bristol. Priory Park was too big and fine altogether for people to-day. But the time must come when decentralisation will take place, and it was to be hoped that then Bath would get its chance.

Mr. G. Hubbard said it occurred to him that perhaps architecture did not influence people's lives quite as much as they imagined. Every age had its own particular architecture expressing the feelings and culture of that particular period. If that was so, it was the life which influenced the architecture, rather than architecture the life. Greek architecture was a standard of perfection in so far as it represented the culture of the period. He took it that the people of to-day were not a particularly cultured lot; they were not as sincere as they might be, and as a consequence their architecture was not as perfect as it might be. Bad as their architecture was to-day, it represented the contemporary unfortunate low standard of civilisation. No doubt, if they could go back to the time when Bath was being built, they would find themselves living up to a higher standard than at present. Gothic architecture was an expression of faith: when faith was highest, Gothic was at its best. It seemed to him that architecture did not elevate the people, but rather that people elevated architecture.

Professor Blomfield, in putting the vote of thanks, remarked that the last speaker was correct in saying that architecture represented what a generation was capable of. But he was not despondent about the state of the art at the present day, for he considered that there were distinct signs of vitality. Everyone had been delighted with Mr. Ball's paper. Amid the usual dry-as-dust text-book days it was refreshing to hear a lecture which attempted to penetrate into the inner meaning of architecture. Anyone who had tried would know the difficulty there was in conveying to others the feelings and impressions one has with regard to

building. The best training for a young architect was still the study of Roman architecture. Mr. Ball did not seem to have done justice to Bath as a really great conception; the city had genius in it. It was not only the first thing of its kind to be done in England, but it could hold its own with the lay-out of such a city as Nancy. They ought not to underrate what had been done in their own country. The paper was one of weight, and the attention of all students should be called to it.

The vote of thanks was then carried by acclamation.

Mr. Ball briefly acknowledged it, and the meeting terminated.

THE Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students who are qualifying for the Final Examination have been approved:—

Subject V.—Design for Art Gallery.—Messrs. H. Charlton Bradshaw, J. Carey, A. D. Clare, G. Davidson, A. E. Davidson, N. S. Dixon, W. E. Foale, E. Gee, F. Jenkins, T. T. Jenkins, S. Stevenson Jones, F. O. Lawrence, B. A. Miller, B. Newbould, A. N. Shibley, S. Soper, A. Thomson, W. H. Thompson, A. Wilson.

Design for a Village Church.—Messrs. H. R. Atchison, P. D. Bennett, Allan L. Freaker, H. J. Higgs, Robert M. Love, E. A. L. Martyn, F. James Maynard, A. Nisbet, A. J. Sparrow, G. E. Charlewood, H. W. Hallas, A. E. Lowes, Wm. Voelkel.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS v. REYNOLDS.

IN the Chancery Division on November 15, Mr. Justice Warrington had before him a motion in the action of the Royal Institute of British Architects against Reynolds.

Mr. Whinney said the action was brought for an injunction to restrain the defendant from using in connection with the business of an architect the letters R.I.B.A., either alone or in conjunction with any other description of letters, or from carrying on business in such a manner as to lead the public to believe that the defendant was a member of the Royal Institute of British Architects. He understood that the defendant did not now contest the matter.

Counsel for defendant agreed to treat the motion as the trial of the action, and to give a perpetual undertaking in the terms of the notice of motion and to pay the costs. He added that the defendant had used the letters inadvertently, and had no intention of offending again. His Lordship made the order accordingly.

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE members of the Nottingham Architectural Society hung up their T-squares and put on festive attire on Tuesday, November 12, to celebrate the jubilee of the Society.

A conversazione was held at the Exchange Hall by kind permission of the Mayor of Nottingham.

The hall was attractively decorated, a special feature being the drawings of architectural work lent by the members; and the presence of the ladies formed an additional attraction.

During the reception by the President and Miss Sutton of the 130 members and friends, and while refreshments were being taken, Miss Hilda Baxter's Orchestra played a number of selections. Other local ladies and gentlemen who contributed to the enjoyment of the audience were Mrs. R. Duncalfe, Miss Muriel Vowles, and Miss Hilda Baxter and Mr. S. G. Walker, who had also arranged the musical programme. A feature of the evening was the dramatic recitations of Miss Tomalin, of London.

The concluding item on the programme was a farce, "Granny," with the following cast:—

Oscar Morris, a young artist ... Mr. Jack Macpherson.
Colonel Hammersley, his guardian ... Mr. Roger Duncalfe.
Mrs. Raltenshaw, a countrywoman ... Mrs. Andrew Oliver.
Maud Hammersley ... Mrs. Roger Duncalfe.

The special designs on the souvenir programme were the work of Mr. F. W. C. Gregory, a member of the Society.

The Presidential address was a review of Nottingham's architectural history during the last half century.

Mr. Ernest R. Sutton, F.R.I.B.A., said:—Ladies and Gentlemen,—The passage of time is a very commonplace theme, and every language is full of proverbs and wise sayings to aid us, no doubt, in making the subject even more hackneyed than it is. But the realisation of time's

progress is quite another matter, for the years go very silently, and it is only on those rare occasions, of which the present is one, that we suddenly become conscious of the fact that what we used to call the present has slipped into the historical past.

Fifty years ago to-night a few Nottingham architects met at the Public Offices by the kind permission of the Mayor, Richard Birkin, father of one of our most worthy citizens, Sir Thomas Birkin. At this meeting it was decided to create the Nottingham Architectural Society. From its very inception it was a fine healthy child, and found many admirers, and it began at once to make its presence felt in the world of Art and Science. In its earliest childhood it was the means of guiding and helping its supporters, and now, at the mature age of fifty, it has not only won the respect of the citizens of Nottingham, but is recognised by all as a Society of considerable influence. It is most gratifying to know that we still have with us three of the original members, Mr. Robert Booker, Mr. W. A. Heazell, and my dear father. It is impossible for us to quite realise what their feelings must be when they review the work the Society has so successfully carried out during the past half-century.

On the other hand, I should like to take this opportunity of expressing on behalf of the profession our appreciation and gratitude to those who were the original founders of the Society. The work was done in an admirable manner, and the foundations they constructed have proved worthy on which to build the prosperity of the Society. The Society was formed for the promotion of uniformity of practice and for the advancement of the profession of architecture and the various Arts and Sciences in connection therewith. I should like to point out that our Society also takes a leading part in all questions of social reform. Take, for instance, the Early Closing Bill, 1912. This matter was receiving the attention of our members as early as 1871, for I find on looking through the "minute book" that at a meeting held in April of that year the architects of Nottingham, on the request of the assistants and pupils, very generously agreed to grant a half-holiday one afternoon in each week—but they made this stipulation, that one clerk must remain in the office, so that it shall not be considered closed. Now let us take a hurried survey of our own city. It is a city we all love, and, if I may be allowed to quote the Bishop of Birmingham, "We all long for Nottingham to be in every sense an example to others, and it certainly is in many respects." I regret to say architecture can hardly be said to be one of its strong features; though we must not forget we have one grand masterpiece just outside the city boundary; I, of course, refer to Wollaton Hall, built in 1580.

And what of the progress and development of our city during the period under review? It seems difficult to realise that we had no electric installation for light and power until 1878. In November of that year it was first used for street illumination in the town on the occasion of an entertainment at the Mechanics' Hall, five lamps being utilised outside the building.

The old horse tram service was instituted in 1878, and six years later a steam tram was running to Basford; the electric car service was not introduced until 1901.

The first telephone communication in the city was established between the Castle Museum and the police station only thirty-four years ago.

It was not until 1881 that the University College came into existence, and was opened by the late Duke of Albany.

The School of Art was erected in 1863, and the Castle Museum was opened in 1878.

Our Society had been established six years when the High School—then known as the Grammar School—was removed from Stoney Street to the present buildings in Arboretum Street.

To return for a moment to our Society, as indicating its steady growth and usefulness, just permit me to remind you that since 1862 the membership has been increased from twenty-two to over ninety. Our first conversazione was held in 1864.

During the past half-century the Society has contributed £116 to the Benevolent Society, £25 to the Nottingham Art Society to promote lecture courses, and £44 3s. 4d. has been sent for the Victoria Hospital Fund, whilst many small sums have been subscribed from time to time to various charitable undertakings.

In the last fifty years we have witnessed many changes in the style of our architecture. In 1862 the Gothic revival was at the zenith of its popularity, and it received its death blow, as a style suitable for public buildings, on the completion of the Law Courts. At this time the pioneers of the profession turned their attention to our English Renaissance, reviving

the details of the architecture from Elizabeth and King James I. and all their varieties to the time of Queen Anne. Still later a mysterious style evolved, which gained for itself the collective title of "The New Art." Coming to the present time, we are now revelling in the Greek art in all its severity. Yes, during these fifty years we have been educating our taste in the historical styles, trying first one and then another, mixing them sometimes, and giving a Jacobean lining to a Georgian overcoat. What revival or new style shall we find when we turn over the next page of our history? Who can tell? We must "wait and see."

In the sphere of design—and I take it this is the proper sphere of architecture—there is a very marked change in the spirit that is abroad to-day compared with that which inspired or depressed the builder in the middle of the nineteenth century. We all know to what depths architecture had fallen; we cannot help knowing, for these buildings of the fifties and sixties will not die, and until a Society is founded with the express object of preserving them they assuredly will not be destroyed. But the very thoroughness with which the average Englishman turned his back on anything rational or graceful in design forced the few who retained some remnants of sensitive feeling into a camp of their own. The Gothic revivalists, these pioneers, did great things. Barry and Pugin raised the House of Parliament above the level of the Thames. Street essayed a bold composition at the Law Courts, and Gilbert Scott—though his love for mediæval design was often more destructive than protective of the work itself—built churches of not ignoble proportions or mean character. The effort of these men must be judged with due regard to the temper of the public and the opportunities of their time. The revivalists taught us that it was necessary to study proved masterpieces before we could form any artistic aspirations or seek to express them. Their gospel had to be preached before we could have Pearson's work at Truro, Scott's cathedral at Liverpool, or the fine conception of Bentley's Byzantine pile at Westminster.

But what of the men who have graced the ranks of the profession during the past fifty years? It would take long to recount to you all the deeds by which they have attempted to uphold the architectural standard, even if we confined ourselves to those who have fought and fallen in the first line. Many of the names will live and many more have interest for us in the fact that their personal efforts have laid the foundation for much that comes more easily to us to-day. One man was living in 1862 whose influence is still very much alive, is, indeed, greater perhaps than ever it was. His name was Alfred Stevens, and, though by profession a sculptor, he had a wonderful power in the design of architectural form. In 1864 J. L. Pearson built the church of St. Peter, Vauxhall, the first modern church vaulted throughout in brick and stone. Pearson was a great artist. Truro was fortunate to find in him the designer of its cathedral, and many of his churches, such as Daybrook, are well known for their fine proportions and delicacy of detail. It is strange to think that Sir Gilbert Scott was Pearson's senior only by six years, for he seems to have been connected more closely with an earlier period. Scott had done a large proportion of his work before the date of our foundation, and we must remember that Pearson outlived him by nineteen years. At this time Butterfield was still alive, and Ewan Christian, both builders of churches. George Edmund Street, the author of the ill-fated Law Courts, Sir Arthur Blomfield, and Alfred Waterhouse—the latter had a wide practice and left his mark in almost every large town, including our own city—these were all eminent architects who worked strenuously for a fine ideal. They were quickly followed by men of equal sincerity, though working in a different style—Nesfield, Mountford, Norman Shaw and others.

We come to men who are still practising, such as Sir Aston Webb, Sir Ernest George, Dr. Burnet, John Belcher, Reginald Blomfield, and their many colleagues; we feel that a delicacy of touch and loftiness of conception has been attained which were perhaps denied to the hard-worked business men of an earlier date.

There is, I think, little doubt that to-day we can build better than fifty years ago. Our materials are better, our cement clings more tenaciously, our bricks and tiles are better burnt, and our whole system of steel constructions has made the dream of 1862 a practical reality in 1912.

Timber is harder to get in seasoned form, but the world's markets have opened up to us an extraordinary variety and selection of materials, and for the best work the finest stuff is forthcoming.

But are we making better use of our wider opportunities than our predecessors, who worked without the use of the rolled steel joist, and who had not even the joy of the tele-

phone and the typewriter in their office? If there has been any failure on our part, I shall hasten to say that those last two instruments of torture are wholly accountable for it.

Both ancient and modern times have agreed to glory in architecture for its effects chiefly and for its methods of construction only in a lesser degree. And does not a principle which has held good for thousands of years appeal to so mature a Society as our own, which already boasts a jubilee? There is scarcely a modern movement that does not require our help to solve its practical difficulties or to invest it with importance and becoming dignity. And now even the Government is becoming interested and is cognisant of the value of our profession.

There are schemes innumerable to replan our towns and villages, to plant garden cities in all our centres of industry, and to teach men and women that their homes can be beautiful, their surroundings healthful.

Mr. John Burns, with his Town Planning Act, has set the official seal on a wide movement, and it will not be the fault of the architect if it does not lead to great results.

The increased activities of public bodies and the awakened interest in worthy buildings combine to give a wider opportunity than architects of the last fifty years have ever known.

And I sincerely hope that the Nottingham Architectural Society may witness a great revival in Art which shall eclipse its past history, and may Nottingham get a lion's share in the honour and the prizes.

Just one word to our junior members and to those who are about to join our ranks. See that you rally round the Society; keep your standard of efficiency high, and place your ideals on a lofty plane; see that the Society is never engaged in a selfish, mean, or ignoble battle. And when you unfurl the banner for inspection on the centenary celebration of the Society, may it bear scars only obtained in fighting for that which is worthy of a noble profession.

Mr. A. N. Bromley conveyed the thanks of those present to Mr. Sutton for his interesting address, and to those ladies and gentlemen who had so ably entertained them. They were sorry Mrs. Sutton was unable to be with them owing to illness, but her duties had been charmingly carried out by Miss Blanche Sutton.

The gathering was honoured by the presence of the Mayor and Mayoress of Nottingham, the President of the Sheffield Society of Architects, Mr. J. B. Mitchell Withers and Mrs. Mitchell Withers, the President of the Derby Architectural Society, Mr. Arthur Eaton, and Mr. R. C. Sutton, one of the original members of the Society.

SHEFFIELD AS AN ARCHITECTURAL CITY.

An instructive lecture on "Beauty in Architecture" was delivered by Mr. W. S. Purchon, A.R.I.B.A., to a large audience at the Sheffield University on Saturday night.

Mr. Purchon, whose lecture was illustrated with many of the finest examples, dealt exhaustively with many important qualities to be observed in architecture, such as unity of composition, points of concentration, symmetry, proportion, and scale, restraint of ornament and sculpture, use of materials, and the necessity for buildings to be true and genuine and suitable to their environment.

It might be asked what should be the citizens' relationship to architecture? Was it something about which they should read or travel long distances to see? Was it not, Mr. Purchon said, rather that which they, as dwellers in a city, should see all about them, in their public buildings, shops, factories, and even in their homes? It might perhaps be difficult to light the lamp of beauty in the peculiar atmospheric conditions of a manufacturing city.

He had heard it suggested, however, that the atmosphere of Sheffield could be improved, and he should not be surprised to find that that was quite possible in these days of engineering efficiency. Most of them would welcome such an improvement. Would it not be worth much to them if Sheffield was a city free from shams and ugliness, a city in which all the streets and buildings were pleasant to the eye and mind?

At the present time a visitor to Sheffield, when asked how he liked the city, invariably replied that the country around it was beautiful. Would the visitor of the future, the lecturer observed, ever be able to say it was a beautiful city with beautiful surroundings?

That was not an impossible ideal. It needed, chiefly on the part of the people, a great love of, and a great desire for the beautiful.

When they as a people were as interested in the beauty of their buildings as they were in sport they would not tolerate ugly cities. Street improvements would no longer be considered only as problems concerned with traffic and the provision of sewers and water mains. The builder of a private house would remember that it was not only for the comfort of himself and his family, but that it was something which would give either offence or pleasure to countless passers-by. That state of things was slowly but surely coming. Already large numbers of people were becoming interested in such questions as town-planning and the provision of garden cities, and incidentally in beautiful buildings.

SHEFFIELD SOCIETY OF ARCHITECTS. AND SURVEYORS.

MR. F. H. WRENCH, A.M.Inst.C.E., delivered a lecture on "Surveying" at the University to members of the Sheffield Society of Architects and Surveyors. The chair was occupied by the President, Mr. J. B. Mitchell Withers.

Mr. Wrench described some of the instruments used and the methods adopted in surveying, and he dealt with the exploration survey made by travellers in an unmapped country, topographical surveys, those surveys made for boundary and jurisdiction purposes, and those made for engineering or constructional purposes. To get over difficulties in the art of sketching, photography had been introduced in many classes of work, and this had proved most valuable. The plane table was hardly ever used in this country, probably because the ordnance survey had done much of the work for which this instrument was most useful. But with this instrument remarkably rapid surveying was done. For rough work the student could easily make his own plane table. A method practically unknown in England, very useful to explorers, was the phototheodolite, with which some excellent work had been done in Canada among the Rockies. The best results with the camera were only obtainable in treeless districts, where an extensive panoramic view could be secured.

Mr. Wrench exhibited a number of surveying instruments, including the latest Zeiss level, and he also showed samples of survey work carried out in most of the principal countries of the world.

THE drawing of a book-case in the library of Pembroke College was made by Mr. E. H. Gibson, on his tour as holder of *The Architect Travelling Studentship* for this year.

BAPTIST CHURCH AND SCHOOLS, PINNER.

THESE buildings have been erected in the Paines Lane, Pinner, and comprise a church with seating accommodation for 500 and a school for 300 children. Externally the walls are built of a dark red brick with Bath stone dressings, and the roof covered with sand-faced Bedford tiles. Internally the joinery is of pitch pine throughout. The buildings include a lecture hall, minister's and deacons' vestries, kitchen and lavatory accommodation. The school hall is divided into separate class-rooms by folding partitions. The contract amount for the whole scheme was £4,318, which was carried out by Messrs. C. Brightman & Son, builders, of Watford, from the designs and under the superintendence of Messrs. Spalding & Myers, A.A.R.I.B.A.

COTTAGE AT BENFLEET.

THIS cottage, of which Mr. Arthur T. A. Bowyer is the architect, was erected some few years ago, and contains two sitting-rooms, three bedrooms, bathroom, &c.

AUDLEY END, ESSEX.—KNOWLE, KENT.

THE photographs we reproduce are in further illustration of work described by Mr. A. E. Bullock in his series of articles on "Interior Decoration."

THE Goole Urban District Council last week formally agreed to proceed with the erection of a town hall at an estimated cost of £7,630, in preference to erecting municipal offices.

THE Lancashire Education Committee have decided to provide new elementary schools at Fleetwood, Horwich, Waterloo (Ashton-under-Lyne), and Whitworth, to replace schools taken over from the voluntary authorities.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Architectural Association was held on Monday, the 11th inst., Mr. Gerald C. Horsley, President, in the chair.

It was announced that on the 28th inst. an exhibition of sketches will be held in connection with the Camera, Sketch and Debate Club, when criticisms will be given by eminent artists.

The President announced the election of Mr. R. B. Carruthers, Regent's Park, N.W., and Mr. Kozo Kitamura, of London.

The election was unanimously agreed to of Mr. W. G. Newton, M.A., as Hon. Librarian, and of Mr. H. M. Fletcher, M.A., as an Ordinary Member of the Council to fill the present vacancies.

A vote of thanks was passed to Mr. T. H. Watson for presenting 233 slides to the Association.

Mr. J. A. Marshall then read a paper (of which we give an abstract) on

Marbles Used in Greek, Roman and Byzantine Buildings.

Apart from its utility, marble has an inherent and mysterious beauty that appeals to everyone, and especially to those who can study its infinite variations in the light of modern geology. The sparkling fracture of white marble interested the ancient Greeks, but they did not know, as we do, that the minute cleavage planes or facets that cause the lustre denote a molecular change in the structure of ordinary limestone. We are told by geologists that this change has been produced by "pressure metamorphism," a high-sounding term, implying that the crust of the earth is mobile, and subject to crumplings, foldings, squeezings, shearings, and other ailments, mostly very insidious in their attacks.

By this gentle treatment sedimentary rocks, such as limestone, can in the course of ages be altered beyond all recognition; what was once a limestone mud becomes a hard crystalline rock by pressure, friction, heat.

It is known that crystals develop according to the freedom given them, and to the length of time they are under the influence of the forces that produce them. In a compact rock like simple marble, where the crystals have not had room to develop, there is merely a confused aggregation. Most crystalline marbles, when seen in a large way, bear evidence of the flow or movement to which the material was subject before it crystallised or became firmly solid; the lines of disturbance are perpetuated by folia, streaks, or veinings, that sometimes represent the thin beds of clay, shale, or other impurities with which the original limestone was interstratified.

It is not uncommon for marbles to show "faults"; this is a geological term applied to rocks that have been split in a direction opposed to the veining, and, after having slipped, had again become united. In some of the strongest marbles the only evidence of the rupture is a sudden break in the continuity of the veining; the scar itself has healed so perfectly, by a mysterious process of chemical secretion, that the strength and homogeneity of the mass are not in the least impaired.

The traditional forms of classical Greek architecture demanded that marble should be used in massive blocks, so that it expressed the construction, without being, in the ordinary sense, a decorative material; applied decoration was provided by sculpture and painting. This being so, we can understand why, in the classical age, the Greeks, preferred the white marbles of their country to the variegated species. The latter, so much sought after by later generations, were never thought of while the art of Polygnotos flourished, and they were utterly incompatible with Hellenic building construction and design.

Before the Persian invasion common limestone was mostly used for building purposes in Greece; this applied even to Athens, although that city is only a few miles from an unlimited supply of the purest white marble.

Later, during the years of comparative peace, the statesman Pericles gave to the public buildings of Athens a crystalline aspect that made the city the most magnificent in Greece. It must not, however, be supposed that this emphatic choice of marble was entirely independent of precedent, any more than the surpassing genius of Phidias, Ictinus and Mnesicles was spontaneously developed for the occasion. Long before the time of Pericles marble was used for a part of the Temple of Apollo, at Delphi, and for parts of the Temple on the island of Ægina.

For the consummate work of the Periclean period, in Athens, the white marble of Mount Pentelicos was exclusively

used. Though brilliantly crystalline, this marble is intercalated with thin seams or ribbons of greyish mica shale, liable to disintegration more than the harder parts. When exposed to the weather that mellow tint comes which all travellers admire who visit the ruins, grand and beautiful in their desolation, on the Acropolis at Athens. In the British Museum the student will find the structural peculiarities of Pentelicon marble clearly indicated by the scarred and furrowed fragments from the Parthenon.

The bluish-grey marble of Mount Pentelicos that overlays the white was not much used by the Greeks, but five miles nearer Athens, on Mount Hymettos, they quarried a white marble streaked with grey. The grey veining—straight, nebulous, or jagged, according to the direction in which the blocks are cut—was, perhaps, not greatly valued by the Greeks, and when the marble was used for statuary, during the archaic period, no doubt its natural markings were concealed by decorative painting.

Some years ago an inscribed slab of Hymettian marble was found, which proved to be the specification for building an arsenal at Lea, the principal war harbour of Athens. A Greek named Philo was the architect, and the date of the inscription is about 346 B.C. There are no remains of the building, but we learn that the walls were to be of local limestone; the vestibules were to have independent ceilings of Hymettian marble, and thresholds of the same material; the doorways were to have lintels and linings of Pentelicon marble; the columns were to be constructed of seven drums of Hymettian, while the capitals were to be Pentelicon.

The most beautiful of white marbles is that of Paros, where it occurs on Mount Marpesius, between beds of grey, in shallow streams, limpid and brilliant. Out of it were fashioned many masterpieces of Greek sculpture and thousands of roofing tiles for the temples of Greece. The Athenians built a Treasury of it, by the Sacred Way at Delphi; so did the Siphnians; and later some of it was used for the monument of Prince Mausolos of Caria.

An early instance of the use of marble was the Temple of Apollo at Delphi, built 530 B.C. It was agreed that this temple should be built entirely of local limestone, but, according to Herodotus, the contractors won a reputation by using Parian marble for the columns of the façade, and declining to make any claim for the "extra."

The archaic pedimental sculptures from the Æginetan temple are of Parian marble, but, as these were partly painted, we may conclude that the material was used in this instance not merely for its intrinsic beauty, but because it was most suitable for figures possessing a certain slenderness and tenuity, reminiscent of work in bronze.

The little Treasury of the Athenians at Delphi, built just after the battle of Marathon, is, like that of the Siphnians, an invaluable example of Attic art at the time of its transition into the perfect work of the fifth century. It is interesting to note that the sculptured metopes of the frieze are of the finest white variety of Parian marble, while the triglyphs are of the grey and coarser kind.

The Romans by their conquests had facilities which they could not resist for obtaining marble from all parts of the known world. They eagerly quarried and sent to the capital of their empire not only the simple whites and greys of Greece and Italy, but also the coloured marbles disregarded by the Greeks; and it is chiefly to their enterprise we owe our knowledge of the finest species.

Like the Greeks, the Romans were accustomed to build with enormous blocks of common stone and white marble, but they found the process slow and costly, and the builders of the empire practised another, less expensive and more rapid, besides being more daring in conception and lasting in its results. The use of concrete and brick called for decoration that could be applied, and as the idea of applying the "Orders" to façades, in connexion with the fenestration was probably derived from the Hellenistic cities of Asia Minor, so perhaps we may accept the suggestion of the elder Pliny that the Romans derived the art of using thin slabs of marble for decoration from the same cities.

From Pliny's account it seems clear that the introduction of foreign marbles into Rome was not due to a desire to embellish some sacred edifice or public building, but rather to gratify the private interests of certain officials of the State. A certain Lucius Crassus, when he came into office, saw an opportunity of getting some marble columns over from Greece which he wanted for his house on the Palatine. The use of this material by a private individual was certain to be deprecated as savouring of Greek luxury; so, to put a fair complexion on the matter, when the columns arrived they were first "offered up" in the temporary theatre as a

decoration or background for the stage. The columns were next seen erected in the *atrium* of his house, half a dozen of them, 12 ft. in height, the first monoliths of Hymettian marble imported into Rome.

This happened about 91 B.C. Later, about 58 B.C., another rich *edile*, Æmilius Scaurus, with the instincts of a millionaire and a great fancy for columns, imported 360 that were quite black. For nearly a month these supported the upper storeys of a temporary theatre, and then the largest of them, 38 feet in height, were carted away by Scaurus to the Palatine for the *atrium* of his house.

A military engineer, called Mamurra, was the first person in Rome who covered the whole of the walls of his house with marble, and who had all the columns of solid marble from Carytus and Luna. This was about 48 B.C.

The white marbles of Luna and Athens were used impartially by the Romans for columns, entablatures, and wall linings. Hymettian marble was used for paving the *peribolus* of the Temple of Faustina, in the *Forum Magnum*; and antique columns of this marble, fluted and unfluted, are to be seen in the churches of S. Sabina, S. Pietro in Vincoli, and Sta Maria Maggiore.

Excepting the grey and black marbles, most of the coloured species known to the Romans have been identified; they were named after the places they came from. The quarries belonged to the Emperors, and in the course of time the number of convicts employed in them became so great that in Trajan's reign a special administration had to be formed to look after them. The blocks, before being shipped off, were usually numbered and frequently marked with the name of the reigning Emperor and that of one of the officials in charge of the quarry. Shiploads of marbles were continually being sent from the ports of Greece, Asia, and Africa. To convey monolithic columns and obelisks vessels of enormous size were specially constructed. It is now impossible to realise the quantity of marbles sent to ancient Rome, but it impresses one to know that there is scarcely a church or a palace without columns and wall linings taken from the ruins of the cities. Then we must not forget that enormous quantities were burnt into lime in the Middle Ages, and broken up for concrete, and the hard white stucco used by the architects of the Renaissance.

The coloured marbles used by the Romans are not only more complex than the marbles used by the Greeks, but there are so many varieties of each species that the mere accident of colour cannot be taken as a standard for classification by the student. The coloured marbles may be placed in three groups—firstly, the foliated and schistose species, in which the *folia* are sharply defined by colour; secondly, those species that exhibit both the spathic and the brecciated structure; and, thirdly, the true breccias that seldom degenerate into a streaky formation.

Next may be grouped together three species in which the general structure may be described as a condition between the spathic and the brecciated; both conditions may be present in the same mass, or either altogether absent. The marbles are the *Marmor Numidicum*, from Simmitu Colonia, near Tunis; the *Marmor Chium*, from the island of Chios; and the *Marmor Scyrium*, from the island of Scyros.

Marmor Numidicum.—This yellow marble was greatly prized by the Romans, if we may judge from the quantity found in Rome and from the frequent allusions to it by the classic writers. It seems to crop up everywhere, from the sacrificial depths of the Heroon of Romulus to the enormous rubbish heap of Mount Testaccio. Besides columns it was used for wall decoration and pavings in connexion with other marbles. The primary colour of this calcareous rock was a creamy-white, but the presence of iron has deepened this to crocus colour, rose and purple.

When Hadrian visited Africa he constructed a road from the quarries to Tebarca, on the coast, whence the marble was shipped to Rome. With the close of the Roman Empire the use of this marble for columns seems to have died out, and it was not revived during the Byzantine period, although the marble continued to be used sparingly for inlay.

Marmor Chium.—The marble of Chios, one of the Ionian Islands, was known as early as the fourth century B.C. to the Greek philosopher, Theophrastus. This marble is not an easy one to describe, so manifold are its variations; and its nondescript character is shared by several kindred species. From the very early notice of *Marmor Chium* by Theophrastus, and the fact that the walls of Chios were built of it, Pliny concluded that variegated marbles were first discovered by the people of Chios. This may simply mean that the builders of the walls availed themselves of the materials nearest to hand, but when the rain brought out the tints the

delighted inhabitants showed the walls to every body as something quite new and magnificent.

Marmor Scyrium.—The marble of Scyros is also perplexingly varied, both in structure and colour, as anyone may see while taking refreshment in some of the popular tea-rooms of London; and, although the quarries were once imperial property, the material cannot be said to possess the unfailing stamp of nobility that distinguishes the species already described. The white ground and the colour contrasts are often harsh, and the stone is brittle.

According to Strabo, monoliths and large slabs of Scyrian marble were to be seen in Rome near the close of the first century B.C., and it became so fashionable there that the price of white marble greatly declined.

Marmor Synnadicum, perhaps the most beautiful marble known to the ancients, deserves to stand alone. The quarries are at Docimium, a village thirty-two miles from Synnada, in Phrygia. Strabo records that only small blocks were extracted at first, but in his time larger blocks were got as translucent as alabaster; and, although their transport to the sea was difficult, yet columns and slabs of stupendous size and great beauty were sent to Rome. Rough blocks have been found with inscriptions dating from the time of Augustus to that of Marcus Aurelius, and from this time onward the quarries supplied Rome until the division of the Empire, when the exportation of the marble was diverted to Constantinople.

Marmor Atracium.—The green serpentinous breccia from Atrax, in Thessaly, is well known by its Italian name, Verde antico. The earliest description of it is by a Christian writer of the sixth century, and its introduction into Rome was probably late. The main constituent is serpentine, mixed with carbonate of lime.

"*Breccia Africano*."—One of the most interesting and noble-looking of the breccias of antiquity is known to the Italians as "Africano," though the ancient quarries have not been discovered. When excavating the site of the Basilica Æmilia, Signor Boni found fragments of "Africano" columns 3 ft. in diameter, that belonged to the nave, while a corresponding series, smaller in size, belonged to the upper storey. According to Pliny, the columns of this basilica were of Phrygian marble, so it was quite a surprise to find that, in the course of time, they had, by some mysterious process, changed into "Africano." From this discovery it would seem that Pliny, like many of the nostrums to be found in his encyclopædia, was not infallible. The modern name, "Africano," is merely an indication of the dark colour peculiar to this breccia.

At the end of the second century A.D., Rome was becoming richer in many costly marbles, and probably "Breccia Corallina" was one.

Marmor Celticum.—Among the later arrivals we must place the *Marmor Celticum*, first described by our Christian writer of the sixth century. The marble came from the western limits of the Empire, and is believed to be identical with the black and white breccia found in Southern Gaul, on the northern slope of the Pyrenees.

Marmor Taenarium.—This name is generally understood to include two species, a red and a black. The red, popularly known as "Rosso Antico," has been identified with a species found in the southern part of Laconia, near the promontory marked "Taenaron" in the classical atlas. Taenarian marble is mentioned by several of the classical writers, and, according to the Greek geographer, Strabo, the quarries were ancient in the first century B.C. The red Taenarian marble of even colour and close texture, and so frequently met with in the museums, was selected by the Romans for the mouldings of internal decoration, and for statuettes and small reliefs. This typical variety of "Rosso Antico" could only be got in comparatively small pieces.

Marmor Alabastrum.—Historically considered, alabaster as a decorative material is more venerable than marble; this is mainly due to the fact that the earliest civilisations happened to be in countries where marble was scarce or unknown; while alabaster was plentiful. Apart from its well-known use by the Egyptians and the Assyrians, it was found in the prehistoric remains of Orchomenos, Mykenæ and Crete. The colossal winged figures from Assyria in the British Museum are impressive examples of brecciated gypseous alabaster. Many columns and fragments of the Oriental banded kind, ranging from the colour of honey to that of dark treacle, have been found in Rome.

The question as to how the Romans used marble for decoration will naturally occur to you. Unfortunately, the evidence of existing examples is practically wanting; a few columns and fragments of architraves, skirtings, and pavings

are all that remain *in situ*, and it is probable that even some of these vestiges belong to late restorations. If we turn to Pompeii we shall find still less of actual marble decoration, though an echo of it may be seen in some of the mural paintings. When the city was hastily restored after the earthquake of A.D. 63, the readiest methods of decoration—stucco and painting—were adopted. There are very few marble columns in the city; like the walls, the columns were generally stuccoed and painted. The painted decoration is often a reflex of marble incrustation. This sometimes suggests work of the *opus sectile* type, especially in the case of the low dado, which retained the severity of style derived from a marble prototype often when the upper part of the wall was treated in that light and fantastic manner popularly known as "Pompeian."

In Rome itself, from the early days of the Empire, marble was gaining an ascendancy over painting.

Pliny laments that in his day the art of the painter was giving way to that of the marble-worker; "for not only," he says, "are walls now covered with marble, but the marble itself is carved out or marquetted to represent objects and animals of various kinds."

Seneca asserts that the bathers of his day would consider themselves shabbily treated unless "the walls shone with large and precious roundels; unless on every side laborious and varied inlay, like a picture, did not border them."

Undoubtedly, of all the public buildings of Rome, the *Thermae* presented the most splendid examples of marble decoration, though the best preserved of these show scarcely anything now but bare brickwork and concrete.

Splendid as it must have been, the decoration of the *Thermae* of Caracalla and of Diocletian represented a craving for luxury and wealth that ultimately deprived the Romans of all powers of refined appreciation. In the Baths of Caracalla some of the paving was formed of thin slices of porphyry and marble cut to patterns, with flowing lines and leaf-shaped ornaments, an elaborate form of *opus sectile*.

Little as we know about their marble decoration, and unrestrained as some of it probably was, we may conclude that the Romans did not fall into the modern error of associating it too intimately with joinery; the æsthetic law of contrast in this connection being, no doubt, complied with by the use of textiles and brodered hangings.

In the fourth century A.D. decorative art in Rome had reached its lowest level. At the beginning of the century Maxentius, the rival of Constantine, began that great Basilica in the Forum that was probably finished by the Christian Emperor. According to Professor Lanciani, the eight columns of white marble that ostensibly supported the vault came neither from Greece nor Italy, but from far-off Proconessus, an island in the Propontine Sea, near Constantinople. The columns were fluted in the classic manner, and one of them now stands as a lonely outcast in the Piazza de Sta Maria Maggiore. The marble when fresh is bluish-white; it is coarsely crystalline and banded with a pleasing grey of various shades. There is no other instance of its use in Rome, and it would be interesting to learn how it came to be used for the Basilica.

From the time of Constantine Proconnesian marble became as important to the builders of the Eastern Empire as the white marbles of Greece and Italy had been to the builders of the Western.

The first churches followed the simplest type of pagan basilica, in preference to the grander type exemplified by the Basilica of Maxentius. The simpler type, with a colonnaded interior, just sufficient to support a wood roof, was easily and quickly erected, especially when the columns were taken, as they often were, from some dismantled building of pagan Rome. Of these early churches in Rome very little is left beyond the columns.

At Ravenna, in the fifth and sixth centuries, decadent Italian art was infused with "a ray of beauty from the East."

Among the marbles to be seen in the Ravenna churches the white with grey veining, from Proconessus, is most prominent, but another favourite for bands and panels was a strongly marked red-and-white foliated species. It is popularly known as red "cipollino." The marble was also used at the same period in Constantinople.

Apart from the Proconnesian columns of the nave arcades and fragments of ambros and parapets, very little of the marble decoration is left in the basilicas of Ravenna, but the aisles and apses generally had a dado of the material.

(To be concluded.)

THE NORTHERN ARCHITECTURAL ASSOCIATION.

THE opening meeting of the session was held on the 13th inst. at 6 Higham Place, Newcastle-upon-Tyne.

After some preliminary business, Mr. Wm. Milburn, F.R.I.B.A., delivered his Presidential address. He appealed to all those who practised architecture in the district to come into the ranks of their Association, and then touched upon trade matters. The great depression of the past few years in the building trade was just beginning to lift. He did not remember a depression which had lasted for so long, and had it not been for the activity in school building in the counties, and house building in the colliery districts, workmen would have had a very bad time indeed. As it was, many artisans had gone to the Colonies, and large numbers were now employed in shipyards.

Dealing with house and town planning, Mr. Milburn said he felt this to be one of the most difficult problems of the present day. Whilst they welcomed garden cities and the better planning of the newer portions of towns, they must remember that the houses vacated by the people who removed to the suburbs were now in many cases let into tenements, so that whilst provision was being made for those who were able to live in healthy surroundings, the centres of some towns were becoming more densely populated, and people were living in houses badly adapted for tenements.

"Something had to be done to better the dwellings of the poor," continued the President, "and I think that we have started fairly well; but we must face the fact that the life of a large portion of our slum properties is nearly run out, and that although they are being put in order as quickly as possible, owing to their age, and, frequently, the rough usage of careless and dirty tenants, better habitations for the poorer classes will before long have to be provided. To my mind, it will not be done by the class of properties which some of the city and town Corporations have frequently erected in the past; such properties are much too expensively constructed to allow of reasonable rents being charged, are not sufficiently home-like for the people who live in them, and have frequently become a serious charge on the rates."

"Improvement schemes are generally costly undertakings, not only so far as the purchasing of property is concerned, but also in the provision of dwellings for the displaced inhabitants by the building of new tenements, which very often have to be constructed with more storeys than the houses they displace, owing to an increased area being necessary for streets, &c. The housing schemes in the rural areas are doing much to meet the demand for healthier homes, but such houses can only be occupied by the fairly well paid artisan, the poor being left behind in the slum areas. Of course, we must admit that a considerable amount of the property in the lowest-class areas is what the tenants have made it, and, however a landlord may try to improve his property, he is not always able to choose his tenants, and I do think that whilst the authorities are dealing firmly with the landlords they should perhaps be a little more strict in enforcing their powers on some tenants."

"As to the remedy, we have the difficulty of first cost and returns to face, as well as the education of the people to live in better surroundings; and if they get into better surroundings and better houses, in many cases there is a difficulty of getting the tenants to keep the houses in order. Whoever takes this question in hand has a very difficult problem to solve; each town or district would have to be dealt with on a separate and different basis, as the areas available for improved dwellings in one town may be much more prescribed than those available in another town, thus necessitating different laying out of streets and planning of houses. Then, again, however much we would like it, it is quite certain that we cannot convert a slum district into a garden city, or clear the whole of the old property from a given area and build new houses without first counting the cost."

"I am of opinion that it might be advisable to expend some of the money now spent by the State and ratepayers on education over better houses for the poor. I do not advocate the neglect of education, but I think the housing question is in many respects of equal importance, because we cannot expect to see healthy children attending school when they are brought up in the gutters, as I am sorry to see hundreds of them are."

Passing on to deal with the provision of sanatoria under the Insurance Act, the President observed that if better living accommodation existed for the poor there would not be so much need for sanatoria. They, however, welcomed the provision in the Act which gave them State aid for the erec-

tion of such institutions. The planning of those buildings would, of course, call for special thought and study by the architects employed.

Mr. Milburn also dealt with the necessity for registration in the architectural profession, and expressed the hope that the Institute would bring it to a successful issue. If the profession were a body acknowledged by law it would be an inducement for more universities to establish Chairs of Architecture.

On the motion of Mr. R. Burns Dick, seconded by Mr. H. C. Charlewood, the President was thanked for his address.

The drawings and sketches made by Mr. A. E. Lowes, the Glover student, during his recent tour, were on exhibition in the Library after the meeting.

FRENCH RENAISSANCE ARCHITECTURE.—VI.

In the sixth lecture of the course on French Renaissance Architecture being delivered at University College, Gower Street, W.C., Mr. W. H. Ward, M.A., A.R.I.B.A., dealt with "The Growth of the Grand Manner and Barocco Palladian Compromise—Early Style of Louis XIV."

In his previous lecture Mr. Ward had shown that the architecture of the earlier part of the seventeenth century in France was largely a vernacular and utilitarian architecture only indirectly tinged with Classical tradition, somewhat heavy in its proportions, much addicted to the use of brick and rustication, and in decoration to the coarse and grotesque manner of the Flemish barocco. But there happened also a revival of the study of Classical models, and a line of distinguished architects began feeling their way to a monumental and characteristic type of architectural expression. This refining process was continued in the reign of Louis XIV.

The reign of Louis XIV. lasted for seventy-two years. Both its political and architectural history might be divided into the three stages of growth, culmination and decline. In the years of Mazarin's rule the greatest architectural achievements were in the town and country houses of great nobles and officials. By the first years of Louis' personal reign the Crown had attained such success in its struggle against the feudal and legal aristocracies that the powerful forces of architecture were concentrated upon royal palaces like the Louvre and Versailles, and upon imposing public works. In the later years of this record reign the royal undertakings ceased to be so all-important, and became rivalled in interest by private buildings.

Mr. Ward concentrated his attention on the first of the three stages. He showed the classicising, simplifying, and unifying process at work, and the growth of the "Grand Manner." Three points, he said, indicate the change in progress. First, there are attempts to bring more of the Classical feeling for unity and repose into the composition; secondly, the orders and other elements of Classical design are more correctly and reticently used; thirdly, decoration becomes more refined. A leading spirit was François Mansart, who designed such typical fastidious works as the Hôtel de la Vrillière, the Château de Maisons-Laffitte, and the remodelling of the Hôtel Carnavalet in Paris (1661). Two important Parisian houses of the period are the Hôtel de Beauvais, by Antoine le Pautre, and the Hôtel Lambert de Thorigny, by Louis-le-Vau. In the former the extreme irregularities of the site are so artistically dealt with as to yield a fully equipped and conveniently arranged house grouped round a court, forming a complete geometrical figure, while all irregularity is absolutely dissimulated. The great Château of Vaux-le-Victoire was built about 1656-60 for Nicholas Fouquet, the Minister of Finance, by Le Vau. This house is particularly interesting in that its buildings, with their decoration by Le Brun and the first artists of that day, and its splendid lay out by André le Nôtre, have been preserved almost intact, and sympathetically restored. Le Vau gained sureness of handling as he advanced in life, and his Collège Mazarin is perhaps the first French public building to give definite expression to the Grand Manner.

After sketching the evolution in decoration which had taken place in the middle of the seventeenth century, Mr. Ward devoted the second half of his lecture to the development of the Louvre and the Tuileries. The Louvre as it stood at the commencement of the sixteenth century was a mediæval castle founded in 1204, and built round a nearly square court. It occupied the south-western angle of the present court, where its outline is marked in the pavement. Rebuilding was begun in 1546 under Pierre Lescot, and was

continued during three hundred years. In 1564 Catherine de Medici commenced the erection not far off of the Tuileries, according to a scheme prepared by Philibert de l'Orme; but the uncompleted work was abandoned in 1572. Le Vau was at work both on the Louvre and on the Tuileries a hundred years later. With the seventeenth century the history of the palaces stops abruptly for nearly one hundred years. Under Napoleon the Tuileries once more became a palace. The two buildings had a chequered career until May 1871, when they were set on fire; the Louvre did not suffer much, but the Tuileries were gutted. Later the ruins were cleared away and the pavilions restored.

CHEVALIER DE MARTINO.

Six dozen oil and water-colour sketches (mostly in petto) from the brush of the lamented Chevalier Eduardo de Martino, Marine Painter-in-Ordinary to his Majesty the King, appeal to the suffrages of the art-loving public from the walls of the Fine Art Society in New Bond Street. And to such as were privileged to have their art education fostered and sheltered under the ægis of the Chevalier there will be a special chord of appeal. These chords do not always return the desired sounds of harmony, for tastes vary with the times, ideas alter with kaleidoscopic uncertainty and irrevocability, and pupils become teachers and art critics. Not that the art critic in *présenti* (the conjunction of ideas suggested by this Latin phrase is scarcely pleasant) was ever pupil of the lamented Chevalier, but *simila similibus respondent*. With such brief introduction, a few paragraphs may be devoted to the exhibition of this artist's works, mostly seascapes.

Slight as some of them prove to be, and perhaps too slight to merit a place on the walls, when the portfolio would be a more fitting receptacle, yet the general effect, in traversing the gallery, is one that does credit to the artist. Such works, for example, as "The Royal Yacht Squadron at Cowes," "Herding Cattle—Buenos Ayres," and "Barge on the Thames" are trifling water-colour sketches, and "A Fishing Boat" is a trifle in oils, but all the same it is most attractive, with the moon appearing from behind the bulwark of a heavy bank of clouds and spreading its silvery sheen over the bosom of the deep.

What is the keynote of the Chevalier's work? In three words—a bright palette. Not the post-impressionists' brightness, *bien entendu*, for our artist and their artists (!) are poles asunder. Apropos des poles, we are shown half a dozen sketches of the South Polar regions, No. 16 almost suggesting the child's idea of the existence of a veritable pole at 0°; it is, however, a highly effective sketch, with the blueish-grey bergs standing out against the wintry sky. No. 22 is also good, though not as attractive as the former; the penguins give an appearance of gross exaggeration in size. No. 68 is decidedly clever, and herein are no precipitous bergs, but a mere abstract effect of frost and isolation.

"Rio de Janeiro" (No. 1) has all the Martino brightness, but is somewhat hard in outline, though we have nothing but praise for the figures depicted. "H.M.S. Victory" (No. 4) is delightful, showing the famous boat under bellied sails standing solitary on the deep blue waters. The artist was so much a master in modelling and painting ships; observe "H.M.S. Victory and H.M.S. Euryalus," "The Garibaldi Sailing Ship," and "The Coast of Spain," the latter with its warship in the offing, the pretty colouring in general and the realistic rose-tinted bank of clouds. "The S.S. Asturias" is noticeable, showing the waters coloured in heavy ultramarine towards the horizon and prettily tinged in green in the foreground (if that term may be employed).

M. de Martino is also represented by some post-"Trafalgar" sketches: "The Santissima Trinidad" (No. 17), provides us with a fine stormy effect at the period of sunset; the same subject, treated in No. 19, is less attractive. "The Bucentaure" is one of the best on show; it may well be termed a Tartarean poem (for, though conscious of having used this term before now, yet it must be remembered that the art critic's vocabulary is not as varied as the artist's palette); the burning ship with the lurid mountain of flames, reflecting and casting an unholy glow upon water and leviathans respectively, must be seen in order to be appreciated.

"In Canada" is a particularly bright morceau with the Martino touch strongly in evidence; contrast it with "Breaking Waves," an excellent sketch, but not in the

WALBERSWICK CHURCH, SUFFOLK.—From a sketch submitted for the Pugin Studentship, 1912, by Mr. A. M. DURRANT.

characteristic bright key, being painted in neutrals and appropriately showing a sullen effect over sky and water. "Crossing the Line" is a poem in regard to colour, though somewhat harsh in technique. "On the Thames" is Martino à la bonne heure, charming in its homeliness and with human interest in the young couple on the moored boat. "In the Atlantic" is another most attractive piece, with its pleasant colouring of the water and the effective trail of grey smoke left by one of the outgoing steamers. Attention must be drawn to No. 38, "Scotland—Day and Night Effect"; here is to be seen the Chevalier's happy treatment of lunar poetry, previously noted, and this, too, applies to "Cowes" (No. 45), "A Dreadnought," and others. "Holland" (No. 49) is a wonderful study in clouds. We must also notice "The Landing Stage, Liverpool," for its crisp treatment in neutral notes, and "Capri" for its brightness and vigour. To others we would like to refer, but space fails, and we must be satisfied to recommend art-lovers to visit the galleries for a personal inspection.

THE schemes of the Manchester Education Committee for this year include the erection of new schools at Heald Place, Rusholme; Old Hall Drive, Gorton; Crowcroft Park, Longsight; and at Sandy Lane, Chorlton-cum-Hardy.

THE Bucks Archaeological Society have passed a resolution protesting against the further removal of the iron railings in the Sion College cloisters, and asking the Earl of Rosebery, the President, to use his influence and good offices towards this end.

THE ROYAL SANITARY INSTITUTE.

A MEETING of the above Society was held at 90 Buckingham Palace Road, S.W., on November 12. Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E., took the chair. A discussion was commenced on "The Report of the Departmental Committee on Intercepting Traps and House Drains."

Sir Maurice Fitzmaurice said they would all regret to hear of the death of Dr. Darra Mair, the Chairman of the Departmental Committee, whose report they had met to discuss that night.

A vote of condolence was then passed.

The discussion was opened by Mr. H. Percy Boulnois, M.Inst.C.E. (Chairman of the Council of the Royal Sanitary Institute). In our issue of last week, on page 301, we gave a report of his paper.

Mr. R. Read, A.M.Inst.C.E., Gloucester, said he was sorry Mr. Boulnois had not been entirely convinced by the report of the Departmental Committee. The intercepting trap was patented in 1872 as a result of a panic, and became incorporated into the model by-laws of the Local Government Board in 1877. The trap was thereupon taken for granted by all concerned. But defects soon began to show themselves. Between 1879 and 1882 he was himself making experiments on sewer ventilation, and he came to the conclusion that the trap was a useless and dangerous obstruction, as it paralysed the action of the drain, and rendered it filthy throughout. It was wrong in principle, and thirty-five years' tinkering had failed to remedy it. If a sanitary or building inspector in testing a drain discovered one pipe had a back-

fall of half an inch he would rightly have it relaid. But the same inspector cheerfully inserted an intercepting trap which created an obstruction of from 6 to 8 inches below the invert of the flattest length of drain. For nearly thirty years his voice had been like one crying in the wilderness, until in 1906 Dr. Butler had joined him in reading a paper before the Royal Sanitary Institute, entitled "Is the Intercepting Trap a Failure?" Then in 1908 the Local Government Board arranged this Committee, which after four years of thorough investigation had produced a report which was a condemnation of the trap on every count of the indictment. True, they gave it the benefit of the doubt on the claim that it cut off the sewer air from the house drain. The advocates of the trap were very hard pressed for arguments, and they fell back on rats. But a rat could dive through an intercepting trap very easily; but he defied any rat to get through a gulley trap with a grid on weighing 3lb. The primary object of all drains and sewers was quick delivery of the sewage to the outfall before decomposition. A trap retained its contents for at least eight or nine hours every night, and for a shorter time during the day. The flow through a sewer, however, was continuous, owing to the numerous drains flowing into it. The sewer was what the drains made it. The removal of the trap rendered both drains and sewers cleaner, and, therefore, there must be less risk, and not more. This was proved by the experiments described in the report. The Departmental Committee had expressed a pious opinion about sewer ventilation. There were only two forces which needed to be considered with regard to it—namely, the wind and the gravitation of the sewage down the sewer. The flow of air down a sewer was continuous, and in the same direction as the flow of the sewage. He hoped the Local Government Board would have the courage to act on their own report and withdraw the by-laws, and that inspectors would act with the same zeal in removing as they had shown in inserting the trap. If that were done they would soon get real cleanliness instead of a sham.

Dr. Philip Boobyer, medical officer of health, Nottingham, remarked that he unhesitatingly accepted the scientific results and conclusions of the Departmental Committee. With some of the facts they had already been acquainted. He only demurred to a general application of the results arrived at by the Committee to cases essentially different from those which furnished them. The behaviour of sewers in different localities was as diverse as their method of construction, their situation, and their contents. Sewers of low and high gradient did not require the same treatment. There was one argument which ought to be demurred to. They did know definitely that there was no cause or relation between sewer air and diphtheria. In the report the inference appeared to be in the contrary direction. He believed that many of the experiments had been made with badly constructed apparatus, and probably in too large drains. He was in favour generally of retaining the intercepting trap, which, when acting efficiently, prevented the access of undiluted sewer air to the atmosphere in or around a dwelling. It was impossible to convince the public that a bad smell was not necessarily associated with a corresponding injury to health. He had known several instances in which an intolerable nuisance had been occasioned through the ventilation of a public sewer by means of a high tubular ventilator carried up the outer wall of a house, the sewer air being directed by air currents and eddies into the interior of adjacent houses by the windows and chimneys. In his opinion, the number of traps which became choked was exceedingly small. Of course, radical alterations had taken place in the views held by experts as to what should be the best form of the Bucknall trap, and it had been very considerably modified during the past twenty or thirty years. If an occasional breakdown was to be considered sufficient ground for condemning the apparatus, then many things must go by the board, including the water-closet.

Mr. T. de Courcy Meade, M.Inst.C.E., Manchester, said that in 1909 he had supplied the Committee with information which showed that in Manchester there were 23,248 intercepting traps in use. The ascertained average number of stoppages per annum was 150, or 0.6. This showed pretty conclusively that traps of proper construction in conjunction with properly laid drains did not give much trouble in Manchester, at any rate. Since they had been introduced the Corporation had employed a very large staff of inspectors, and the greater part of the redrainage work had been carried out by the contractors to the Corporation. These facts, no doubt, accounted for the small amount of trouble they had received from the intercepting trap.

Mr. F. Sumner, M.Inst.C.E., City of London, stated that personally he was strongly against intercepting traps where

the distance from the trap to the lavatory accommodation was at all great, as the force of the water was then lost. The report seemed to sound the death knell of such traps. Everyone had to admit that the men employed in the sewers were positively the healthiest men to be found—that had been clearly shown in the case of the metropolis. He entirely agreed with the suggestion that the traps should be removed from small houses; but as regards larger houses, where they had sufficient water to cleanse the drain, then its removal was a matter optional to the occupier. They would have to overcome the prejudices of the medical officer, the architect who designed the house, and of the person who used it; but he had no doubt that in a few years' time all houses would be disconnected when the fallacy of the value of the trap had been properly explained. He hoped every engineer would welcome their removal, because when a trap became choked the inconvenience was very considerable. He strongly advocated that house drains should be made of iron; the additional expense in a reasonably sized house would not be more than 20 per cent. That was one of the cures for the whole thing, and in such a case they might well dispense with the intercepting trap.

Dr. William Butler, assistant medical officer of health, Willesden, said he had been brought up in the orthodox faith that the intercepting trap was a revered institution not to be questioned, and it was only because of the facts borne in upon him as an administrator that he was forced to question the dogma. It was not the number of complaints as to the choking of interceptors which raised the matter, but the fact that if for any purpose manholes had to be examined it was found in a large proportion of the cases that they were choked, and the cap of the raking arm was missing. That was a very serious matter when there were about 30,000 interceptors in the district. And Willesden compared extremely well with the other localities examined by the Departmental Committee. People very often did not know when their drains were choked. The Committee recommended that in future, whether they had interceptors or not, drains should be made in such a manner that there should be an early indication of any choking. The abolition of the intercepting trap was the only effective way of safeguard against sewer air. The trap necessitated a fresh-air inlet, and this usually was placed in close proximity to the house. People would have a 5-inch opening immediately below the sill of a window communicating directly with the drain; and no one thought anything about it. In 10 per cent. of the cases the drain was ventilating the sewer. If they did away with the interceptor the corollary was that the drains should be made gas-tight and air-tight, and that could be done undoubtedly by having an iron drain. It might well be made a condition of the abolition of the trap that the drain should be iron, and that it should be cut off from the manhole, so that the moment there was a blockage it would show at once at the nearest gulley.

Dr. Louis C. Parkes, medical officer of health, Chelsea, asked how much of the stoppages of the intercepting trap were solely due to the faulty laying of the drain, and not to the trap itself. Colonel Horrocks, whose experiments at Gibraltar threw so much light on the question, considered that where there was no intercepting trap, or where the raking arm was open, drain air would readily pass into the sewer and out again through adjacent house drains. The suggested abolition of fresh-air inlets where intercepting traps were used would, he thought, be a great mistake. Although they might possibly in certain cases be a source of some danger, yet as a rule they provided the fresh air to keep the drains sweet. He certainly did not think the intercepting trap was a thing to be given up lightly. The pioneers of hygienic science were responsible for it. He did not care what the bacteriologist or the physiologist said; medical experience showed that where sewer or drain air got into a house there was a liability of actual sickness among the inhabitants.

Mr. E. Van Putten, M.Inst.C.E., Lewisham, declared himself in favour of the report. Sewer air had been found to be of a better condition than drain air, and when that was once acknowledged no argument was left for the use of the interceptor. His chief reason for wishing to abolish the interceptor was in order to have better ventilation for the sewers, and if they got ventilation for the sewers through the house drains, which, after all, were the chief offenders in causing smells in the sewers, he did not see why they should not have it.

Mr. A. J. Dickinson, Redditch, said he was entirely in favour of the report. The chief question was its effect on their future policy with regard to interceptors. His own Council had issued the following circular to architects and

builders: "In view of the report of the Departmental Committee of the Local Government Board, the Council feel that they cannot enforce their by-laws requiring interceptor traps and fresh-air inlets to be provided on the drains of new buildings. In future, plans will be approved if they show all drain openings to be properly trapped, and if a 4-inch vent shaft be provided at the highest point of the drains." The wisest course would be to block up the air inlets that caused a nuisance and remove the interceptors when they became choked.

Mr. G. B. Hartree, Alton, said he had come as a champion of the intercepting trap, and, so far, had heard nothing to make him change his views.

The discussion was resumed on Tuesday last, the 19th inst.

Mr. H. C. H. Shenton said it appeared to him that the report was based on evidence overwhelmingly proving that the intercepting trap was open to objection. Therefore, it was waste of time to discuss the merits or demerits of the trap. The subject for discussion ought rather to be how they were going to apply the report. The intercepting trap was declared to be unnecessary so long as the fittings are properly trapped, in which case there would be very little risk of drain or sewer air getting into a house. It should be noted that everything was trapped twice except the water-closet, which had only one trap. He suggested that if the interceptor was taken away the w.c. ought to have more than one trap.

Mr. C. H. Cooper, M.Inst.C.E., Wimbledon, thought the crux of the whole question was "sewer air." The arguments in the report were based on the investigations of bacteriologists. Bacteriology, whether they relied on it or not, was very much governed by chemistry—which science they had had much longer than bacteriology. The great fault of the report was that it made light of the dangers of sewer air. To found an argument solely on chemistry and bacteriology seemed to him to be dangerous and wrong. They all knew of actual instances where serious evil effects had been suffered from sewer air. The intercepting trap must, of course, be attended to, otherwise a nuisance would be created.

Mr. Johnson, Wimbledon, opposed the idea that sewers should be ventilated through the soil pipes. The owner of a private property had, he said, the means of ascertaining whether or not his own drains are perfect, and he can remedy the defect if they are not. But he has no means of finding out about the sewers. Everyone knew that there were sewers—and sewers. The report declared the fresh-air inlet to be a nuisance; if that was so, the nuisance lay in the intercepting trap on account of such reasons as bad design or bad construction. His own experience was that quite as many stoppages occurred in the back manhole, where there was no intercepting trap, as in the front manhole, where there was one. In his own district there were no traps in connection with the service water drains, and it was only about those that they received any complaints. He was quite satisfied in his own mind that sewer air has a very harmful effect. They might not agree with the report, but he did agree with the idea that local authorities should be allowed to use their own discretion in administering their drainage by-laws, which at present were sometimes a very great hardship.

Mr. J. Jennings spoke on the necessity for disconnecting the sanitary fittings from the house drains. The authorities agreed that the danger lurked in the smaller private drains rather than in the sewers. Yet little or no attention has been given to the disconnection of the soil pipes from the house drains. The water closet was not disconnected at all. It behoved sanitary engineers to fortify all houses against drain air.

Mr. E. Willis thought that Willesden had done a great service in being instrumental in bringing together so much useful evidence on the subject. Surely it was impossible for them to collect better evidence than a Departmental Committee, with its unlimited means and other advantages, had obtained. Again, were they going to ignore that evidence? Personally, he had concluded that something was wrong with the intercepting trap prior to the publication of the report. He had examined a number of the traps with excreta under ordinary conditions, and found that many of them were choked with paper and rags. Only in one or two instances was the blocking-up due to the stoppers falling into the trap itself. But in every case that he tested with a pail of water he found that the excreta and paper were entirely removed. Anything less than a three-gallon flush only occasionally did this. Consequently, he came to the conclusion that there was room for improvement in the methods of flushing. They must disabuse their minds of the

idea that an intercepting trap was a proof against rats, for that was not so. He believed that in a large number of cases the intercepting trap would be done away with in consequence of the report. The maximum weight of opinion was in favour of their removal. But when the traps were done away with they must provide a double trap for every water closet. This is only given in the case of the valve and the syphonic closets. If they did this they would be tending to lessen to a minimum the chance of rats having access. The witnesses who appeared before the Departmental Committee were not men who had axes to grind, and their status in the profession was sufficient to show that they would give impartial evidence. The bacteriological evidence proved that splashing was the primary cause of the discharge of offensive gases in both drains and sewers. He totally disagreed with the suggestion that because a sewer was apparently odourless and inoffensive it was therefore incapable of producing any ill-effects on those who breathed the air. A recent examination by an assistant and himself of a length of sewer which was apparently odourless and yet which nearly overcame them both was proof to the contrary.

Mr. Scott argued that if there was no danger in the air which escaped from sewers there could be no objection to getting rid of intercepting traps. The latter might undoubtedly become out of order after being installed. It was generally recognised that the ventilation of sewers was still an unsolved problem. It seemed to him, however, to be a very dangerous proceeding to make a great and revolutionary sanitary alteration upon evidence which might be upset before many years had passed. It was quite possible that the Royal Sanitary Institute might, after having committed itself for many years to this system, decide to drop the advocacy of the trap in consequence of the report. Later on some terrible creature may be discovered in the drains, and householders will be ordered to replace all the interceptors until scientists had discovered a disinfectant capable of killing the animal.

Dr. Porter said he began by being orthodox, but before the appointment of the Committee he began to have doubts about the intercepting trap. Nothing had yet been said in the discussion which shook his opinion that the trap was no protection. If it was going to stop anything at all it would be to stop the contents of the drains to which it was attached.

Mr. A. A. G. Malet said that two of the members of the Departmental Committee (on which he had served) were brought up in the orthodox faith as to the efficiency of intercepting traps. Their report had not been written in order to bolster up or pull down the reputation of the trap, and the members had had no intention of showing any preference. His own belief was that sewer air was less dangerous than drain air, though by that he did not mean that either of them was necessarily unobjectionable. That makes the necessity of an intercepting trap other than a vital one. If there were extraordinary circumstances the trap might certainly be necessary. One of the great dangers in the absence of a trap was in the possibility of the ventilator pipe becoming blocked. No one wanted either drain air or sewer air in a house. In the report the Committee paid particular attention to the question of smells, and they recommended iron pipes. Evidence showed that in Germany there was only one town which required intercepting traps, and there it proved such a nuisance that the authorities had to take them out.

Mr. A. J. Martin remarked that he had taken the precaution of making sure of his premises before attending that meeting, and he found that the dictionary said a trap was a snare. He himself was afraid that most traps had in them elements which rendered them a delusion and a snare. Dr. Butler had argued that a trap was an excellent thing. But it seemed to him (the speaker) that a trap was very much in the nature of a charm as recommended for wear against evil—though it was too big to wear round one's neck. In his opinion a trap would serve an equally useful purpose if used to grow geraniums in. They laid their drains ever so carefully, and then put in a contrivance which holds back the solid matter and brings about stagnation of the sewage. The advocates of the trap were reduced to awful straits—a weaker argument than the talk about rats it would be difficult to find. There was no doubt whatever that the objections to the trap were really tangible ones, whereas the advantages of it were problematical. A very heavy blow had been struck at the idea that a trap was necessary in all cases. But they must bear in mind that sanitary engineers would stultify themselves if they compelled people now to root out what they have been compelling people to put in. Householders should be given an option in the matter. Too far-reaching conclusions ought not to be built up from the

report. He did not think it safe to rely altogether upon the investigation; they ought also to have an investigation of results. It might be well for the Council of the Royal Sanitary Institute to combine with the Council of the Institute of Sanitary Engineers, and address circulars to the various authorities throughout the country and ascertain their opinion on the subject. Then the results could be summarised by someone highly competent, and brought before the proper people.

Mr. Cottram thought that the time would come when they would be able to do away with the intercepting trap. But as in several of the provincial towns there were old sewers they were bound to cut the people off from the air emanating from them. When they so improved the sewers that they were no longer elongated cesspools then they would find the public willing to do without intercepting traps. He abominated the fresh-air inlet, and he considered that there was no need to carry fresh air into the drains; and he was doubtful whether it was necessary to pump air into the sewers. In the present state of public opinion, however, he thought that no one would be justified in ordering the abolition of the trap. But they might be given permissive power to sanction its abolition in the case of new systems of sewerage.

Mr. Thomas Gorniot considered that the finest result of the investigation was the recommendation it carried with it for the employment of iron pipes.

Mr. H. Percy Boulnois, M.Inst.C.E., in concluding the discussion which had been opened by his summary of the report, remarked that he did not think they were any nearer a conclusion than they were when they started that discussion. What they wished to discuss was what precautions they would have to take if the intercepting trap was to go—and he believed that it would have to go. First of all, their sewers would have to be reconstructed properly. Then all the drains must be connected at a proper level to avoid splashing, and they must be exceedingly carefully laid. The water closet would have to be double sealed. Iron pipes would come into almost general use, and in that improvement he believed thoroughly, as they gave greater general security. He hoped there would be an improved flush, because half the present evils—and what probably caused the Departmental Committee to be appointed—were due to the insufficiency of the two-gallon flush. Its introduction by the water companies was poor economy, for people had to use a two-gallon flush two or three times, whereas a four-gallon flush did its work at once. It was to be regretted that more sanitary inspectors had not been examined by the Committee. They would have to accept the fact that the trap, though not condemned, was proved to cause trouble. Therefore it must be permissive for the officers of the various authorities to take each place on its merits, and act accordingly in the matter of its abolition or continuance. He had been brought up in the belief that the intercepting trap was a safeguard against a common enemy, the public sewer. He still had an idea lurking in his mind that sewer air was bad.

RIVERSIDE STUDIES BY H. S. TEED.

AN Art critic is not necessarily one who cannot practise the art criticised. This is not meant to be funny, merely leading to the statement that the present office-holder has at various times practised the noble profession of Apelles, having had the advantage of being trained on sound principles. This being so, there is justification in offering a suggestion that Mr. Teed would have been well advised to treat his subject in water-colours instead of in oils. For there is a domesticity about the Thames, even in its grey moods, that seems to ask for the more tender treatment of the lighter medium. However, what is presented to the gaze must be accepted as an accomplished fact, and judged from the standpoint of the heavier medium.

Mr. Teed is most to be commended in his studies after nightfall. "Queenhithe at Night" and "Evening, from Battle Bridge Stairs," toned in blues and greys respectively, are worthy of inspection; there is more "subject" in the latter, thus rendering it the more effective. "Cannon Street Station: A Summer Night," though not equal to these in merit, is still very pleasant, and is worked in more cheerful tones of blue than "Queenhithe." Another study, somewhat similar in effect to the last-named, is "Near Southwark Bridge at Nightfall"; whilst "Summer Evening Below Tower Bridge" is bright and is well touched-in, but what is the meaning of the curious brown patch in the sky? is it perhaps a masthead flag detached from its mast? The dark hull in the foreground of the picture forms a telling contrast

to the lightness and brightness elsewhere. "St. Paul's" would be better had the paint been laid on less grossly, for thereby the "breadth" is destroyed (until the eyes are half-closed) and the detail-modelling is shattered; still, the work is well-modelled en masse, and is very forceful. "The Foundry Dock" is a fine, broad study of an interior, the light and shade are well managed, and there are atmosphere and clean colour, qualities in general absent from this collection.

In "Showery Day" is presented a distinctly clever picture in greys, with the sky and water well put in. "Early Morning Below the Bridges" forms a satisfactory sketch; chiaroscuro is here in evidence, and the "distance" effect is very successful. Certain other exhibits are passable, such as "High Tide off the Tower," "Just Before Dawn," &c., but the latter seems scarcely worth painting. "Summer Morning from Hungerford Bridge" will not do at all; the colour is coarsely splashed on, and even from extreme diagonal survey the coarseness is apparent. "A Spring Morning from the Southwark Side" is anæmic, and some other works are also distinctly poor; nor, indeed, is the whole effect of the Exhibition, despite individual good works, other than poor and unsatisfactory.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Architects' and Surveyors' Approved Society.

SIR,—It is doubtful if architects and surveyors or those employed by them have fully realised the effect of the Insurance Act, or the way in which it will in the future affect them. When the benefits payable under the Act come into force and those employed fall sick, and find (as is bound to happen in many cases) that their employers decline to pay the usual salary, the trouble will begin.

The principal reason for the formation of the "Architects' and Surveyors' Approved Society" is to keep in the profession the funds supplied by architects and surveyors, and those employed by them, instead of allowing them to be distributed amongst the miscellaneous membership of the ordinary Approved Society. That it was wanted is proved by the daily growing membership. But in addition we believe that many members of both professions have long felt that they would like to see some form of provident or benevolent fund available for those clerks and assistants who may, through no fault of their own, fall on evil days, but the difficulties of starting such a scheme and administering it fairly have hitherto stood in the way of its foundation. Now, however, that new conditions have arisen, the Insurance Act has made the necessity of some such scheme greater than ever for the reason above mentioned, and the same Act has created the necessary machinery for administering and organising such a fund by means of the honorary members of the Society, who subscribe 10s. 6d. per annum.

The Architects' and Surveyors' Approved Society have now under consideration various suggestions and proposals for administering the annual sum which is provided by the subscriptions of honorary members, and it is hoped that the professions will widely support this fund. It is proposed to work in harmony with the existing Architects' and Surveyors' Benevolent Societies, which all exist for the Principal rather than the Assistant.

All communications, subscriptions, or suggestions will be welcomed, and should be sent to the Secretary at 18 Tufton Street, Westminster, who will submit them to the sub-committee now dealing with the subject.

No active steps will be taken in the actual administration of this fund until definite proposals have been submitted to the Councils of the Royal Institute of British Architects, the Surveyors' Institution, the Architectural Association, the Society of Architects, and the Quantity Surveyors' Association, who are represented by their Presidents and Secretaries. —Yours faithfully,

GEORGE CORDEROY,
A. GODDARD,
IAN MACALISTER,
H. D. SEARLES-WOOD,
C. MACARTHUR BUTLER,
MAURICE E. WEBB
(Members of Sub-Committee).

FORTHCOMING EVENTS.

Friday, November 29.

Edinburgh Architectural Association: Associates' Annual Smoking Concert, at 8 P.M.

Institution of Municipal Engineers: Meeting at Gloucester, at 3 P.M.

Saturday, November 30.

Institution of Municipal Engineers: Meeting at Exeter at 3 P.M.

ARTS AND CRAFTS.

THE tenth exhibition of the Arts and Crafts Exhibition Society does not seem to have benefited by its change from the New Gallery to the new Grosvenor Gallery.

The lessened amount of space at its disposal seems to have affected not only the quantity but also the quality of the work exhibited, or perhaps it is that the Arts and Crafts movement has done its work and raised the level of artistic craftsmanship to a point beyond which it is unable to go.

As we walk through the Grosvenor Gallery we are impressed with the feeling that we have seen it all before, that there is nothing fresh, but simply replicas of ideas that have become the trade mark of the Arts and Crafts Exhibition Society.

We are inclined to doubt whether, in regard to many branches of craft, the work now on show is as good in design as that which we have seen on former occasions; from these, however, we must except metal work and jewellery. There are in various rooms several glass cases containing metal work, in silver principally, which, both in design and execution, is admirable, whilst the jewellery is wholly delightful. Sumptuous book-making is also a craft which provides admirable specimens of excellent and artistic workmanship, both in bookbinding, in printing, and in manuscript decoration and illumination.

Woodwork is generally good and up to the usual standard of the Arts and Crafts Exhibition Society, although there are some few works to which we are inclined to take exception. The place of honour in the long gallery is, for example, occupied by a large fireplace for a new room at Dunsany Castle, Ireland, designed by George Jack, executed by McLaughlin and Harvey, assisted by Henry Elliot (foreman), the carving by J. Milligan and George Jack. We understand that this work is unfinished as regards the oak overmantel, and that some of the panels are to be carved and coloured. At present the oak is very new and its tone clashes with that of the very beautiful green and blue-grey Irish marble of the mantelpiece. The design of this marble work is not quite admirable as it adopts the falsity of a keystone in the lintel, and on the keystone is a silly little corbel which has no other function than to break the horizontal lines of the design, and that unhappily.

In the oak overmantel there is a jumble of lines and panels which suggests a laboured effort at originality rather than the wise restraint which is generally pre-

valent in woodwork in this Society's exhibitions. The carving is very elaborate, but there is a lack of harmony in the feeling of the various portions, and the whole work suffers from a lack of restraint.

Another fireplace, in the small gallery, is designed by H. Longden, executed by the Carron Company, assisted by F. Rhodes, J. Dalton, and J. Howershand, and is also not a very satisfactory production. The mantel is of black marble veined with white, the overmantel in wood painted white, the contrast being a good deal too startling for our liking. Here also the marble lintel has a sham keystone, and the best part of the whole composition is the grate in bright steel moulded and chased, but even this is disfigured by meaningless lines of mouldings which have no particular reference either to construction or composition, but are no more than an attempt at applied ornament, and even that not a particularly pleasing attempt.

Mr. Ambrose Heal is represented by several admirable pieces of furniture, in which he has made good use of the capabilities of black-bean wood in a book and print case and a china cabinet with inlaid lines in box and ebony and little pieces of mother o' pearl. A dining table in chestnut, a sideboard in walnut, and a dresser in chestnut, are all sensible pieces simply designed, not even excepting the circular fronted drawer in the last-mentioned article. A writing bureau with bookshelves in walnut is also simple and good.

Sir Robert Lorimer is also an extensive contributor of a number of pretty things in wood, leather, and metal, which include several groups of pendant angels for new choir stalls at Dunblane Cathedral executed by Louis Deuchars and carved by W. and A. Clow. These angels, but for their wings, are of very mundane disposition and busily engaged in making love.

A painted and gilded cabinet by Jessie Bayes and a praying desk by the same lady are examples of misdirected endeavour which could scarcely find a place in any building of the present day. Inelegant architectural forms and a dazzling expanse of gilding ruin all opportunity of enjoyment of some of the painstaking decoration which has been lavished on these unfortunate articles. The crafts would certainly be better without the assistance of such art as this.

A carved reading desk in walnut for Highbury Hill High School, designed by John D. Batten and executed by Norah Bennett, is clever in its simplicity of construction with piquancy of form.

There are many admirable examples of carved work

Monday, December 2.

Royal Institute of British Architects: Business Meeting at 8 P.M.
Royal Academy: Course of Six Lectures on "Chemistry" opens at 4 P.M., by Dr. A. P. Laurie, D.Sc.
Architectural Association: Athletic Club Dance at the Wharfedale Rooms (Hotel Great Central), at 9 P.M.
Society of Engineers: Paper entitled "The Deflections of Reinforced Concrete Beams," by Mr. Percy J. Waldram, F.S.I., M.C.I., at 7.30 P.M.

Tuesday, December 3.

Illuminating Engineering Society: Paper entitled "Modern Methods of Indirect Lighting," by Mr. F. W. Willcox and Mr. H. C. Wheat, at 8 P.M.

Wednesday, December 4.

Royal Archaeological Institute: Paper entitled "The Corbridge Excavations, 1912," by Mr. R. H. Forster, LL.B., F.S.A., at 4.30 P.M.

Edinburgh Architectural Association: Paper entitled "Robert Adam, Artist and Architect," by Mr. Percy H. Fitzgerald, M.A., F.S.A., at 8 P.M.

Northern Architectural Association: Students' Meeting at 7.30 P.M.

Nottingham Architectural Association: Exhibition and Criticisms of Designs for "An Oriel Bay," by Mr. H. Gill, M.S.A., at 8 P.M.

Guild of Architects' Assistants: Paper entitled "My Experiences of the Formation of an Approved Society," by Mr. W. H. Baker, at 7.30 P.M.

as, for example, the "Edge of the Forest" by A. Muriel Møller, a long carved panel in walnut in low relief that is, however, rather spoilt by an over affectation of conventionalism in the trees which bear flowers bigger than the deers' heads; it is also rather a mistake in composition in so small a work to have two hinds of identical pose. A carved hawk and a carved owl, both in wood, by M. Grace Mead, are clever, and next to them another carved owl by O. Waldmann, as a newel post for staircase, which, with a smooth surface as its use demands, has a wonderful amount of expression.

A very fine piece of modelling is a little work in silver by A. Bertram Pegram of "The Babe, the Son of Mary."

The stained-glass designs are not altogether admirable, although there are some very good pieces. Three cartoons by C. W. Whall and M. Hutchinson for the figures of St. Columba, St. Margaret, and St. Athanasius are excellent pieces, and the florid treatment of the quasi-architectural accessories, although open to objection from one point of view, nevertheless expresses its purely decorative function.

Karl Parsons in a coloured design of part of east window in St. Mary's Church, Norwood Green, has a very tame and easy-going St. Michael shown in a drawing in which both the saint and the dragon appear quite at their ease and void of all suggestion of conflict.

The same artist's "Fortitudo" and "Spes" in his design for part of window in All Saints' Church, Eastchurch, Sheppey, are more suitable to the narrow lights of the window for which they are designed. Mr. Parsons, however, seems to be fond of red spots of blood.

There are not many illustrations of actual architectural work in the Exhibition. Mr. C. R. Ashbee has apparently two studies of a design for the London Fraternity House, Shrewsbury Court, Chelsea, one shown in an isometric drawing which seems to attempt art by a crude combination of battlements and crowssteps with peculiar and incorrect Renaissance detail, whilst the other design, shown in washed-out water colour, is at least a reasonable treatment on "new art" lines.

Mr. A. S. Dixon illustrates by drawings and photographs his executed Church of St. Basil, Birmingham, a Romanesque brick building with a mosaic, designed and executed by F. Hamilton Jackson. Mr. Arthur J. Penty exhibits by photographs a picturesque and simply treated house, "Noonfield," Haslemere, which derives much of its charm from a sloping site. Mr. A. H. Powell shows photographs of a simple stone building at Brandsley, and Mr. Curtis Green a small Church of the Good Shepherd, Frensham, which is a simple brick barn artistically treated. Mr. Ernest Gimson shows his design for the new capital of Australia, which does not appear to us to possess any particular merit.

NOTES ON BOOKS.

"Concrete Costs. Tables and Recommendations for estimating the Time and Cost of Labor Operations in Concrete Construction and for introducing Economical Methods of Management." By Frederick W. Taylor, M.E., Sc.D., and Sanford E. Thompson, S.B., Member American Society of Civil Engineers, Consulting Engineer, Authors of "A Treatise on Concrete, Plain and Reinforced." (New York: John Wiley & Sons. London: Chapman & Hall, Ltd.)

The scientific analysis of costs in all branches of manufacture is a development of industry which is carried on in America to an extent never dreamed of by some of our old-fashioned rule-of-thumb contractors and their estimating clerks. Indeed it is scarcely going too far to say that no bill of quantities priced in this country will give for every item a profit on the actual cost of the work, much less a uniform rate of profit throughout. The general principle which seems to be adopted in the pricing of building work in this country is that "what you lose on the swings you gain on the roundabouts," and

if the job on the whole comes within a reasonable margin of the anticipated profit, the contractor is satisfied.

We doubt whether the volume before us represents anything but a fair approximation to an average when we find that the amount of time taken to do a certain piece of work by hand labour is estimated to the decimal of a minute. The amount of work done by hand in a given time varies even on similar operations with the character and ability of the workman, the weather and other conditions and the efficiency of the supervision of foreman or ganger, and it is only by taking observations of a large number of similar operations that any reliable average can be arrived at as to the length of time that a particular piece of work will take. We have an example of this in the book before us where observations were made on the work done by mixing gangs preparing concrete. One gang mixed and laid 50½ cubic yards per day of ten hours, whilst another operated 68 cubic yards in the same time.

In so far as the information given in the book is made up from averages of many jobs, it affords useful guidance for a contractor, but it must be remembered that the instances and examples are taken from American production, where, as we know, men are paid at higher rates of wages but do considerably more work than they do in this country. There can be no question that scientific investigation of the cost of work by careful detailed analyses of various operations tends to a better arrangement and management of those employed, and their more economical production.

"The Law and Practice of Rating both within and without the Metropolis." Third Edition. By Walter C. Ryde, of the Inner Temple, K.C. (London: Butterworth & Co. and Shaw & Sons.)

This book has always been considered as one of the leading authorities on the law and practice of rating and is modelled on plans which make it complete and well arranged. The new edition appears to be as well up-to-date as the others have been. The whole of the book has been thoroughly revised, and all new cases have been incorporated. The preface to the new edition is interesting reading, and the author's suggestions are well worthy of careful consideration should our legislators ever find time to codify the law relating to rating.

The question as to the rating of railways, docks, gas, water, and tramway companies are matters very often of a complicated nature, and whether Quarter Sessions should still deal with them is a matter which requires consideration, but in this text book, for the present, they certainly have a valuable guide and collection of authorities.

The whole question of rating and assessment is so technical and involved that it is seldom that these matters are dealt with without going to a specialist on the subject; even a specialist requires a good book of guidance and reference; in Ryde's book on rating they will find what they require.

"Problems in Engineering with Solutions." First Series, 1909-10. Edited by Sydney G. Turner, A.M.Inst. C.E. (London: St. Bride's Press, Ltd.)

This little book is a reprint of questions and answers from the assistants' and students' section of the "Surveyor and Municipal and County Engineer." It must not be assumed as the title would suggest that this publication is merely a compilation of mathematical computations, for it is really something more. The book contains only 186 pages, and yet in it are found matters relating to mechanics and hydrostatics, strength and elasticity of materials, theory of structures, surveying and levelling, water supply and hydraulics, sewerage and sewage disposal, roadmaking and tramways, building construction and materials, and in a final chapter many miscellaneous matters from practical mathematics to the design of abattoirs and the testing of the illuminating power of gas.

The book should prove useful to young men preparing themselves for the career of a municipal or county engineer. They will find many useful examples worked out in detail of the kind they are likely to meet with in their everyday occupation, as well as much other information of a practical kind.

The mathematical knowledge required is of a simpler order, for in the solution of only a very small number of the problems given is a knowledge of the calculations required.

The book is full of suggestions to the engineering student, and the editor is to be congratulated on the manner in which he has performed his task. If a fault is to be found, it is in the fact that no index has been provided to the book. The explanations are generally full, clear and suggestive; and it is perhaps only in the treatment of the problem on the theory of structures

THE MONASTIC MANOR OF COBHAM.*

By MR. THOMAS G. LARKING.

ALTHOUGH during the progress of building operations on the Glebe Estate at Cobham evidences of the Celtic and Roman occupation were revealed by Mr. Frederick Higgs, it is not until the reign of Wulfhere, King of the Mercians, that Cobham seems to take its place in history. The Venerable Bede speaks of the holy life of Earconwald, and of his building two famous monasteries: one for himself at Ceortesei (Chertsey) and the other for his sister Ethelberga at Bercingham (Barking); and Chertsey had the distinction of being the first monastery erected in Surrey. A charter printed by Kemble, which he considered earlier than the year 675, is a grant of lands for the augmentation of Chertsey Abbey by Frithwald; and it is signed by himself, Earconwald, and King Wulfhere. The lands were the personal property of the under-king, and the thorp or village by Chertsey, with its five dwellings, was the only place identi-

THE OLD CHURCH HOUSE, COBHAM.

involving the calculations relating to a roof truss that a fuller explanation is necessary than that given.

In the first alternative method of solving this problem, at page 42, the student is instructed to use Rankine's "Method of Sections," but no reference is given to any text book in which an explanation of this method will be found. This method will not be known to all students, and in consequence they may find it difficult to follow the calculations given on the page mentioned.

No doubt the editor will put these small matters right when the second edition goes to press.

SIR ARTHUR BLOMFIELD & SONS, architects, have prepared plans for a church building to be erected on the north-western side of Park Walk, Chelsea, S.W.

MESSRS. JOHN BELCHER, R.A., & J. J. JOASS have prepared plans for additions and alterations to Messrs. Whiteley's premises in Queen's Road, Bayswater, W.

fied; the rest of the lands, over which two hundred people were scattered, had not yet acquired distinctive names. The Chartulary of the Abbey gives the date of its foundation as 666, and the lands bestowed by Earl Frithwald, sub-regulus of Surrey, included the present Cobham. Earconwald remained Abbot of Chertsey until 675, when Theodore, Archbishop of Canterbury, consecrated him Bishop of the East Saxons, with his seat in London. He died in 693, was buried in St. Paul's Cathedral, and was duly canonised, as were Ethelberga and Theodore.

The grant of Cobham with other manors to the Abbey was confirmed by Offa, King of the Mercians, in 787, when Ceolnod was Abbot; by Ethelwulf in 827, apparently during the lifetime of his father, King Egbert; and about 890 by Alfred the Great, during the abbacy of Beocca. Edgar the Peaceful in 964 not only confirmed the grants to Abbot Ordbright, but re-established the Abbey, which had been burned by the Danes; and the possessions were further

* Read at a meeting of the Upper Norwood Athenæum.

increased by Edward the Confessor in 1062, when Siward, who became Bishop of Rochester, was Abbot. And so through the ages Cobham remained the property of the Abbots of Chertsey, and William the Norman, when Odo was Abbot, seemingly made no effort to dispossess them, for in the Domesday record, as translated by Mr. E. H. Malden, M.A., we read: "The Land of the Church of Chertsey. In Amelebridge Hundred. The Abbey itself holds Covenham. In the time of King Edward it was assessed for 30 hides; now for 12½ hides. The land is for 10 ploughs. In demesne there is 1 plough; and (there are) 29 villeins, and 6 cottars with 9 ploughs. There are three mills worth 13 shillings and 4 pence; and 1 acre of meadow. Wood worth 40 hogs. In the time of King Edward it was worth 20 pounds; now 14 pounds. William de Wateville holds 2 hides of the Abbey itself." These two hides are believed to be represented by a farm called Norwood, formerly Northwood.

Like most place-names, the orthography of Cobham has undergone various modifications. From Covenham it was changed in the thirteenth century to Coveham; in a "Fine" the 5th of Edward IV., it appears as Coham; in a Post Mortem Inquisition it is Cobeham; in the Inventory of Edward VI., Cowham; and a seventeenth-century shopkeeper named Thomas King marked his "halfpenny" token Cobum. Probably etymologists have struggled and juggled with the word, seemingly without tracing its derivation, but, as we see in early Saxon days it was unnamed and probably uninhabited, it is evident that from the monks it received its first name; and as Covent Garden, vulgo Coven' Garden, is a corruption of the Convent Garden of St. Peter's, Westminster, may we not read in the name that Covenham was originally the ham or farm of the Convent of Christ and St. Peter at Chertsey?

The Domesday Book makes no mention of a church at Cobham, but it is quite probable that a Saxon timber structure stood there, for the Normans do not speak of any churches at Guildford, though it is known they existed at the time. The first recorded rector was Michael, in 1224, under the abbacy of Alan; and the church is mentioned in the taxation of Pope Nicholas IV. in 1291, when Bartholomew de Winton was Abbot. It is dedicated in honour of St. Andrew, and the earlier parts are the tower and south doorway, which Mr. Philip Johnston assigns to about the year 1150. The north chapel he dates from 1200 to 1220, and the windows inserted there to about 1330. In 1853, 1866, 1872, 1886, and again in 1902 restorations took place, and some of the walls were rebuilt, but the old roofs of the nave and north chapel, dating from the latter part of the fourteenth century, have, fortunately, been preserved. The Norman tower shows much of the original work within; in the upper storey on each of the four faces there are two round-headed lights divided by a round shaft with scalloped cap, and enclosed by a round-headed arch. The entrance to the tower on the east side is by a plain round arch on square jambs with scalloped caps. The south doorway has zigzag moulding, showing signs of recutting. On the south side of the north chapel there is a thirteenth-century triangular piscina with two drains. Two of the brasses are of considerable interest. The oldest is a small rectangular incised one representing the Adoration of the Shepherds. It shows a shed, with an erect figure of St. Joseph—disproportionately large—and the Virgin lying on the ground, with the Holy Child in a crib by her side. The heads of an ox and ass peer over their stalls, and two shepherds and a sheep-lad stand in adoration. The date is about 1500. The other brass is a palimpsest now revolving on pivots. The obverse shows a priest in full Eucharistic vestments bearing the chalice and Host. This brass Dr. F. R. Fairbank, F.S.A., assigns to about the year 1510. The reverse represents a man in armour, and no doubt is the one mentioned by Manning and Bray as being in the old church chest, which still remains. An inscription was with it commencing, "Of your charite pray for the Soules of James Sutton, sometyme bayle of this Lorde-shyppe and Mawde hys wyf." This Sutton died in July 1530. Of modern monuments the basrelief of "The Pilgrim at Rest," by Richard Westmacott, junr., is probably the most interesting. It is a memorial to W. H. Cooper of Pain's Hill. There are six bells, the earliest dating from 1687, and the imperfect registers commence in 1562. The present vicar is the Rev. Canon William Leighton Grane, M.A.

Mr. J. W. Flower, F.G.S., traces the name of the Mole in Amelebridge, as the Hundred was termed, and evidently a wooden bridge crossed the river in Saxon times; but at Cobham there were only fords, the one on the road to East Horsley, and the other on the Portsmouth Road.

By the marriage of William the Conqueror with Matilda

of Flanders, the blood of Alfred the Great was conveyed to the future Kings of England, and by the first marriage of Henry I. a more direct descent was established. The ill-fated Edmund Ironsides had a son, Edward the Outlaw, and his daughter Margaret became the wife of Malcolm III. of Scotland. Their daughter Matilda, also known as Maud, Mahalde, and "Good Queen Molde," was the first wife of Henry I., and when the river Mole was swollen one of her maids of honour was drowned in attempting to cross the ford. For the repose of her soul the Queen had a wooden bridge constructed, and the Abbot of Chertsey, probably Hugh, and the Lord of the Manor of Walton-on-Thames agreed to keep it in repair. But the bridge was only available at flood-times; at others it was barred. Maud is chiefly remembered as having founded the Priory of the Holy Trinity within Aldgate in 1107, and the Leper Hospital of St. Giles-in-the-Fields in 1108; and Henry I. is stated to have granted various rights to the Abbot, probably William, including free warren. Later a wooden bridge was constructed at the other ford, and for centuries they remained. About 1760 the East Horsley Road bridge was replaced by a brick one, at Downside, and by statute of George III. a stone bridge was built at Pain's Hill on the Portsmouth Road, the foundation having been laid on July 15, 1782; and here it may be mentioned that after the battle of Worcester Elizabeth Wyndham assisted Charles II. to escape, and in recognition of her services he granted a fishery at Cobham Bridge to her husband, Thomas Wyndham.

Edward I. in 1285 confirmed to Abbot Bartholomew his hunting rights at Cobham, and leave to enclose a park, so at that time the manse or grange would probably be erected.

COBHAM CHURCH, SURREY.

In the reign of Henry VI. in 1432 Abbot John de Hermondesworth is believed to have built the Church Style House, probably as a resting-place for pilgrims, and as a home for the officiating priest, and in 1635 it was restored. These dates were found carved on a bracket when, about ten years ago, Mr. Leonard Martin, F.R.I.B.A., again restored the building. From the last Abbot, John Corderioy, it passed to the Crown, and subsequently the freehold was bought by Roger Bellowe, whose will is dated April 29, 1614. John Aubrey, writing in 1718, quotes from the table of benefactors fixed in the church: "Mr. Roger Bellow gave 20s. yearly for ever out of the rent of Church Stile House to be distributed in Bread to the Poor on Good Friday." Virtually he bequeathed the freehold to the churchwardens of St. James, Clerkenwell, conditionally that they paid twenty shillings yearly to the churchwardens of Cobham, and the residue of the rent was to be spent "none otherwise than in bread" for the poor of Clerkenwell. Later the house became a Home of Rest for ladies of slender means, and then for women of all classes. More recently it passed into the possession of Mr. John Joseph Brown, who still resides there. A half-timbered building with picturesque gables, Ye Old Church Style House is one of the charms of Cobham, and in some of the rooms the old oak panelling remains.

Abbot John Corderioy in April 1534 granted a forty years' lease of the manor to Richard Sutton, but Henry VIII., who was ever attracted to fresh hunting-grounds, induced Corderioy to part with it, and not unwisely he did so in exchange for £5,000; and so in 1537 the manor of Cobham became Crown property, and Henry was there for the sport of the chase on several occasions. On Henry's death in 1547 the manor passed to Edward VI.

The Norman Survey mentions three mills as belonging to the Abbey of Chertsey. At present there are two, and probably they occupy the old sites. The one as we approach Church Cobham, where the Mole, or Emlyn stream, broadens out, is particularly picturesque, and we may regard it as the one that on April 10, 1552, Edward VI. granted to Sir Anthony Brown, Knight, on condition that he kept the "cogges, ronges, and bayes" in repair.

On the death of Edward in July 1553 the manor became the property of Queen Mary, and in the same year she granted it to George Bygley and his wife Elizabeth. In 1564 their daughter and heiress, Dorothy, becoming the wife

COBHAM CHURCH.—BRASS, "THE ADORATION OF THE SHEPHERDS," circ. 1500.

of Robert Gavell, conveyed the manor to him, and in August 1572 he obtained a grant of arms. He died in 1595, and their son Francis succeeded to the property. His son Francis became the next lord of the manor, and, dying in 1633, was succeeded by his son Vincent, and on Vincent's death it passed to his son Robert Gavell, who in 1708, with the sanction of his son Robert, sold the manor to the Viscountess Lanesborough.

This sale is somewhat interesting, for, though the manor was virtually parted with, the manor house was retained as the personal property of the Gavells, and it became known as Cobham Court.

From the Gavells Cobham Court descended to the Woods of Littleton, in Middlesex, and when Manning wrote in 1804 Thomas Wood was the owner. In Brayley's time (1846) it was the property of Colonel Wood, M.P. for Brecknockshire, and was tenanted by Thomas Baker. A few years later it was sold, and became the seat of Mr. Philip Warren; later it was purchased by Mr. Bennett, and is now occupied by Mr. C. J. Agar.

Cobham Court, though partly rebuilt, still contains portions of the old manor house, and of considerable interest is the Priest's Hole or hiding-place. By Mrs. Bennett some particulars have been kindly given. Although the front of the Court has been rebuilt, the back part is of fifteenth-century work. The Priest's Hole, discovered about seven years ago, is in the chimney of the servants' hall behind the kitchen. It is a chamber about 5 feet square, and clearly indicates that the Gavells followed the faith of their fathers. The upper portion of the chimneypiece in the hall originally belonged to the White Lion Hotel, but was purchased and re-erected by Mr. Bennett. It is elaborate Jacobean work. The cellar is interesting, and from it a blocked-up passage formerly led to the Mole.

The oldest part of the present Cobham clusters by the parish church, and is known as Church Cobham; with the coming of the coaches on their way to Portsmouth and elsewhere, hostels and houses sprang up along the main road, and so Street Cobham was formed. And in later days the old tilting ground was encroached upon, and the district of Cobham Tilt came into being.

The White Lion Hotel, a relic of the old coaching days, is the most interesting inn remaining in Cobham. In the public bar, the wide chimney corner, with its seats and niches for the mugs, remains. In the smoking-room the fireplace is partly backed by Tudor bricks in herring-bone work, and in other parts of the house there are ornamental stone fireplaces. A paragraph in *The People* of October 3, 1897,

stated that recently when the wall paper was stripped off some old oak panelling had been revealed. This panelling is now seen in the oak-room; part of it is early Elizabethan, the rest is mitred. On two or three of them coats of arms are emblazoned. The passage, too, is panelled, and is surmounted by ornamental Jacobean moulding, and here the date 1649 is marked, and the same date appears on the back wall of the house. But this may only be the date when possibly a timber front gave place to the present red bricks. By John Taylor the names of several old inns have been handed down to us. He was born in 1580, and became a Thames waterman. During his leisure moments he wrote crude verses, and so he is still remembered as the Water Poet. He saw the sedan chair give place to the private carriage, and witnessed the advent of the hackney coaches. Carriages in the London streets he described as "hell carts," considering that the life of every foot passenger was in danger. Could he re-visit the glimpses of the moon, what would he say of taxi-cabs and motors? He travelled about a little, probably making most of his journeys by water, taking notes of what he saw, and in 1636 he published a book relating to them. The names of the chief inns he also recorded, and at Cobham he mentioned "The Lion" and "The George." So seemingly the White Lion is older than the recorded date. The George was quite recently taken down, and has not been rebuilt.

The word "totem" was first printed in 1791, when J. Long issued his "Voyages and Travels of an Indian Interpreter." Many of us first heard of totems through reading "The Song of Hiawatha," by Henry Wadsworth Longfellow; and from Section 14, headed "Picture Writing," we get a fair idea of what totems were. Through the advance of the pale-faces, many Indians had perished, and no sign marked their graves. Hiawatha induced his followers to remedy this, and with his pigments he taught them how to paint:

And he said: "Behold, your grave-posts
Have no mark, no sign, nor symbol.
Go and paint them all with figures;
Each one with its household symbol,
With its own ancestral totem;
So that those who follow after
May distinguish them and know them."
And they painted on the grave-posts
Of the graves yet unforgotten
Each his own ancestral totem,
Each the symbol of his household;
Figures of the Bear and Reindeer,
Of the Turtle, Crane, and Beaver.

By this we see that the totem was a primitive form of heraldry, the tribal or family crest. Henry Rowe Schoolcraft, LL.D., in his important work on the Indian tribes of America, reproduced in colours several of the totems, among them a merman, a kingfisher, tortoise, catfish, eagle,

TOTEM POLE AT COBHAM.

reindeer, wolf, deer, and bear. Later it seems that the painted posts gave place to carved ones, as being more durable, and, from being merely grave-posts, totem poles were erected in front of the chiefs' wigwams. One of these Mr. Bertram H. Buxton obtained from the Haida Indian village of Masset, Queen Charlotte Islands, British Columbia. He brought it to England in 1882, and erected it in his grounds, known as Fox Warren, Cobham; and that it is the most important pole of the kind in Europe is fairly certain. The embedded portion of the pole having decayed, it was re-erected on the estate of Mr. George Barnes, Foxholm, and it now stands on a concrete base, and is held by an iron framing. It is 41 feet high, is virtually black, and Mr. Higgs identifies the wood as pine, and seemingly it is the *Pinus Lambertiana*. It may be described as a pedigree pole, for besides showing the bear totem, several quaint human figures are carved above and below it. The oldest totems known are the turtle, the bear, and the wolf. Among additional totems mentioned by Andrew Lang are an eel, pigeon, hawk, cockatoo, dog, wombat, frog, owl, emu, kangaroo and turkey. Mr. Otis Tufton Mason, M.A., gives illustrations of totem posts in Queen Charlotte Islands. One is somewhat similar to Mr. Buxton's, and another is surmounted by the full figure of a bear. Two other pictures of poles in the same island are given, but these, instead of being of wood, are of black slate, and the totems represent the eagle and raven. Harmsworth illustrates three poles on an Indian grave at Klinkwan, but what the totems represent it would be difficult to determine. In a descriptive paper on Mr. Buxton's pole, written by Professor Edward B. Tylor, D.C.L., F.R.S., in 1898, he says: At the summit of the pole three figures are seated, whose rank is shown by their wearing chiefs' hats. And he cites a legend in relation to the deluge connected with a tall hat. Other legends are given by Mr. J. Deans in "Tales from the Totems of Hidery," published in 1899. The figures, however, we may accept as chiefs; the highest one as the first who was known as the Bear, and his supporters as his immediate successors. The next group is described as the Bear with the cub between his paws, and eating a frog. Lower down is Hoorst the Bear and Joivats the hunter; and the story is given that once when the Bear returned home he found his wife confused, and he charged her with unfaithfulness. This she stoutly denied, but when she went to fetch wood and water the Bear tied a magic thread to her, and, following it, he found her with the hunter, whom he at once slew, as shown in the carving. Towards the base of the pole are two figures, and below them is seen the Wolf.

Several writers have argued that the Indians worshipped their totems, and believed themselves to be descended from animals and birds; and Grant Allen, B.A., contends that the early Anglo-Saxons had a similar belief. But in neither case is there any real evidence to support such a theory. From their personal and physical characteristics, strength, endurance, keen sight, fleetness of foot, wisdom, and other traits, Indians and Saxons alike won their names, and they honoured their ancestors and took pride in their pedigrees; and it is interesting to note that Herbert Spencer held this view.

The Indians believed in the Great Spirit, and as Gitche Manito, Wazheaud, Moneda, or Maho peneta, he was always their creator; and all Saxons held the Scandinavian faith that their first parents were formed by the All Father Wodin from the sacred ash tree, the Yggdrasill.

Besides the authorities quoted, I am indebted to writings by James Thorne, F.S.A., M. S. Cornford, Henry J. Sides, C. A. Vellacot, A. Ridley Bax, F.S.A., and George Catlin; and for considerable aid given me in arranging this meeting I acknowledge the kindness of Mr. Frederick Higgs, and for literary assistance I thank my friend Mr. W. F. Harradence.

FRENCH RENAISSANCE ARCHITECTURE.—VII.

In his seventh lecture of the course now being delivered at University College, Gower Street, W.C., Mr. W. H. Ward, M.A., A.R.I.B.A., dealt particularly with "The Culmination of the Grand Manner—Style of Louis XIV."

The previous lecture had shown how, during the middle years of the seventeenth century, the rather coarse elements of the architecture of Louis XIII. were refined away, how classical influences and at the same time the ideas of grandeur and pomp grew. The architectural expression which these ideas found in the culminating period of Louis XIV.'s reign was called by Mr. Ward the Barocco-Palladian compromise. The declamatory spirit of Italian Barocco, though closely akin to the French ideas of the time, had, on the one

hand, to be toned down. The rationalistic or utilitarian theory of design formed another element in the Grand Manner as evolved in France. The architecture of Louis XIV. thus arose out of a compromise between the conflicting schools, some examples of it inclining more to one extreme, some to the other, others, again, clinging to the rationalistic method, but none escaping altogether the influence of the compromise.

The growth of the Grand Manner and its expression in the terms of the Barocco and Palladian compromise was illustrated by Mr. Ward in the successive alterations to the great Royal Palace in Paris which grew out of the combination of the Louvre and the Tuileries, particularly in the history of the completion of the Louvre Court, whose eastern side was still unbuilt. What was to be expressed was the palace of a monarch who said, "L'Etat c'est moi." Bernini's scheme was a fitting emblem of absolute monarchy at its culmination. But it was too revolutionary. Perrault came on the scene, and exactly hit off the requirements of the situation. His admirable Louvre Colonnade has been much criticised. It certainly ignores minor truths of structure and utility in order adequately to express the culture and the aspirations of the time. The Barocco element in Perrault's Louvre on the eastern and river fronts is to be found, if at all, chiefly in the grandiose spirit of the conception. In all else—in proportion and detail and ornament—Perrault shows himself of the pure Palladian school. The effects of his design were far reaching. His use of the lower storey as a stylobate for an order embracing the two upper storeys became the stereotyped treatment for almost all palatial and monumental architecture in France for a century or more.

A much more decided leaning to the emphatic Barocco manner is exhibited in many of the important works of the Grand Reigne. In one group the Barocco element is formed in combination rather with the rationalistic than the Palladian tendency; examples are the Porte St. Martin in Paris, and the Porte du Peyron at Montpellier.

If the thing be regarded as a whole Versailles, the favourite residence of Louis XIV., may be accepted, according to Mr. Ward, as the most complete artistic expression of the Grand Reigne. This includes its decoration, furniture, and works of art, its gardens and its dependencies. Mr. Ward then traced the history of the building from the reign of Louis XIII., when it was a little brick château, till 1789, when it ceased to be a Royal residence. The work of enlargement was commenced under Le Vau. Between his death in 1670 and a revival of building operations in 1678 the great decorative works of Le Brun and his army of craftsmen were mainly carried through. In the artist's declining years the chief influence was wielded by Jules Mansart, a great nephew of François Mansart. Le Brun is justly credited with a large share in the formation of the style Louis XIV. His work is characterised by all the heroic scale, the massiveness and clear ordinance, and all the richness of form and colour of the style evolved by Vouet, Le Pautre, Marot, and others under Mazarin.

The last years of Louis XIV.'s reign, said Mr. Ward, in conclusion, were years of comparative failure. As regards architecture, though there was no actual decline, there were symptoms of change. A decrease in the unity of aim became manifest, particularly as the influence of Le Brun diminished, and after his death in 1690. After him, while the Grand Manner in, at any rate, monumental architecture suffered no eclipse, and while it retained to a great extent its Palladian purity and even increased in severity, the type of ornament which accompanied it, and the type of internal decoration which it housed, abandoned more and more the solemnity and pomp which had characterised them in the great days of Louis XIV., and assumed a gayer, lighter, more capricious tone. Though the taste of the designers still continued to invest the union of architecture and decoration with the appearance of harmony and congruity, which is often very charming and effective, it is nevertheless evident from the study of the first half of the eighteenth century that they were essentially diverse in their aims, pulling in opposite directions and not permanently reconcilable.

ILLUSTRATIONS.

BANK OF ADELAIDE, LONDON, E.C.

This building has been erected upon the site of the old premises occupied by the Bank of Adelaide since 1895.

The new premises comprise four floors, the fourth being occupied by the resident housekeeper.

The third floor consists of one large room about 45 feet by 28 feet, to be used for storage, stationery, &c.

The second floor consists of two large front and back rooms, used respectively as a visitors' and a reserve room.

The first floor is occupied by the correspondence staff and Board room. The correspondence room, about 45 feet long by 28 feet wide, is well lighted from both ends. The necessary wall finishings cannot be completed at present, owing to the new brickwork being insufficiently dry. The Board

department at rear, seems to afford a satisfactory solution to this most important problem. The central position of the staircase, fitted with full automatic push button safety lift constructed by Messrs. Smith, Major & Stevens, Ltd., and lighting area in the centre of the building afford excellent light and ventilation throughout. The walls of the banking hall have been lined with second statuary marble by the Art Pavements and Decorations, Ltd. The fittings throughout the banking hall are in Honduras mahogany.

BANK OF ADELAIDE.—LIFT ENCLOSURE AND STAIRCASE.

room, measuring 30 feet by 24 feet, is well-proportioned, and various Australian produce and flowers, &c., the ram's horns having been worked into design for corbel under the clock shelf. This oak work and the carving by Mr. Rogers has been executed at Messrs. Trollope's Grosvenor Road Works.

The ground floor, which is used for general banking purposes, extends for a depth of about 90 feet back from the pavement, and was somewhat difficult to arrange, owing to the narrowness of the site. However, the plan adopted of placing the cash desks and bill department upon either side of a central passageway, with manager's room and securities

The basement is used entirely for strong rooms, safes, &c., and staff lavatories, with the exception of storage reserve. The strong room, treasury and safe construction has been carried out by Messrs. Hobbs, Hart & Co. and Messrs. Chubb.

The building is warmed throughout from heating apparatus in the basement, together with hot water supplies to all lavatory basins. The work has been carried out by Messrs. George Wright & Co., Ltd.

The front has been built in Portland stone facings, while the rams' heads in frieze over the ground floor are intended

to typify Australia. The red letters over the entrance are in vitreous enamel upon copper, and have been supplied by Messrs. Yennadis & Co. The total height of the front above the pavement is 63 feet 6 inches, exclusive of roof.

The building is of fire-resisting construction throughout, all steelwork (which has been supplied by Messrs. Rutt & Co., of Basinghall Street, E.C.) being cased in concrete, and the floors and roofs constructed of steel and concrete.

The building has been carried out from the designs and under the superintendence of Mr. Lionel U. Grace, A.R.I.B.A.

PANEL IN OAK FOR A DOOR.

THIS panel, 3 feet 4½ inches by 2 feet 2 inches, was carved by Mr. Mark Rogers, R.B.S., for a billiard-room. The inscription around reads:—

"As it is written, and is sooth and unto men more profit doth the froward Fortune and contraire than the swote and debonaire," and is quoted from "The Romaunt of the Rose," by Jean de Meun, translated by Chaucer.

TERRA-COTTA PANELS IN WALNUT FRAMING.

THESE panels, by Mr. Mark Rogers, R.B.S., were exhibited at the Royal Academy. That of the Centurion is in the possession of H. Oxenden Hammond, Esq., of St. Alban's Court, Hingham, Kent.

SKETCHES FROM YORK MINSTER AND NEWARK.

THE drawings of the Chapter House, York Minster, and the Parish Church, Newark, were made by Mr. E. H. Gibson, on his tour as holder of *The Architect Travelling Studentship* for this year.

THE ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of the Architectural Association was held on Monday, the 25th inst., Mr. Gerald Horsley, President, in the chair.

It was announced that the Athletic Club Dance will be held at the Wharncliffe Rooms, Hotel Great Central, on Monday, December 2, 9 p.m. till 2.30 a.m. Tickets, price 8s. 6d. each, including supper and refreshments, can be obtained in the office.

The following elections were confirmed: Messrs. S. G. A. Cockle (Dovercourt), G. M. Mackenzie (Westminster), and R. M. H. Philip (c/o Bank of Australia).

Mr. Gerald Horsley said that there were two matters which he wished to put before the meeting. The first was to call attention to the very interesting exhibition of prints and drawings of London, and also the exhibition on view in the gallery upstairs, showing drawings done in the A.A. schools during the past term, which would give a very good idea of what excellent work was being done there. Next it was his melancholy duty to refer to an event profoundly affecting them all at the present time—viz., the great loss which architecture had sustained in the death of Mr. Norman Shaw, which occurred a week ago. They should particularly take notice of this, not only because they were architects, but because Mr. Norman Shaw, in the early days of the Architectural Association, was one of their Vice-Presidents—about 1857. It was impossible for him (the speaker) to say how much they were all indebted to Mr. Norman Shaw, whose influence upon architecture had been so great. It was not too much to say that the whole course of modern architecture as known to-day had been directed by his genius and ability. He would therefore ask the meeting to support a vote of condolence with the relatives of the late Mr. Norman Shaw, R.A.

The vote was carried by the members rising in silence.

Mr. Gerald Horsley said that he had also to ask the members to pass a similar vote of condolence with the relatives of the late Mr. E. B. I'Anson. Mr. I'Anson had been a member of the Association for many years, and his work in the City of London and other places was well known. In Mr. I'Anson they had lost a man who was universally respected by all who knew him.

Mr. Horace Cubitt, A.R.I.B.A., P.A.S.I., then read the following paper, entitled:—

The Prosaic in an Architect's Work.

It will, of course, be admitted that an architect should be competent in all branches of his work. To such end we have now a most elaborate system of architectural education, and, apart from this, we are all, in some measure, students to the close of our days. But there is a tendency for study to be very largely confined to subjects which readily appeal to the imagination, and in consequence other subjects of less interest, but of very great importance in the work of an architect, tend to be rather neglected.

The statement that an architect should know his work must not, however, be construed to mean that every architect must be competent in regard to all classes of work that architects undertake to do. There are many branches of work occasionally carried out by architects which are not, in the correct sense of the term, architectural work. There is, for example, the valuation of property. It will surely be admitted that, although a scale of fees for this work is quoted in the Institute's Schedule of Professional Charges, a member of our profession when engaged in valuing property is acting not as an architect, but as a surveyor. The same applies also to the work of preparing quantities. An architect when executing such work is surely, for the time being, a surveyor. Other important instances where work frequently undertaken by an architect is in reality that of a surveyor are the measurement of the area of a building site or building estate, and the settlement of dilapidations. No suggestion is made that an architect should not be conversant with many subjects which come within the term "surveying." It will often be very helpful to him in his practice if he is able to undertake work of this nature, although in the larger towns he will do well to leave such subjects as the valuation of property and the preparation of building quantities to surveyors who specialise in these subjects. But such knowledge is in no way essential, whereas it is obviously of primary importance that an architect should be thoroughly acquainted with the carrying out of

all matters that correctly come within the scope of the term "an architect's work."

It may be said that it is difficult to know where to draw the line between true architectural work and surveying work that is undertaken by architects. But there is really no difficulty at all. An architect, as the designer of building work, should obviously be acquainted with all branches of knowledge that affect the work of design—using the word design in the correct sense of the word, and not restricting it as is so often done to the conception and elaboration of ornamental features. Beyond this his knowledge need not extend. It will be seen that ignorance of the various branches of work already mentioned will not handicap in the slightest the designer of building work. With valuations and dilapidations he is clearly not concerned, and his design will probably gain rather than suffer in execution, if the survey of the site and the preparation of the quantities are undertaken by some other person.

But an analysis of the process by which a design is evolved will show that there are other branches of work of very great importance to the designer, which are frequently incorrectly classed as belonging not to architecture, but to surveying or engineering. These branches of work, which cannot usually be mastered without considerable application and study, do not appeal to the majority of architects and architectural students. Hence, the wish and the thought being in the proverbial relationship, there is a tendency to regard a knowledge of such subjects as not essential to the equipment of an architect. Why, it is in effect said, should we waste on these prosaic subjects valuable time which might be better spent in gaining a fuller knowledge of art? But can this attitude be justified? A designer when called upon to deal with an architectural problem is surely required to have a knowledge not merely of proportion, architectural detail, and the customary methods of construction, but of all the practical requirements, restrictions, and possibilities that affect the work on which he is engaged. The evolution of a design is such an intangible process of catching up, weaving together, and elaborating ideas that arise in the brain that the designer can work freely and satisfactorily only if he has a thorough grasp of everything that materially affects his work. But, it may be said, this is expecting too much of the designer; surely it will be permissible for him to get the opinions of specialists on certain points, and then, if necessary, modify his design accordingly. Imagine a composer of organ music being compelled towards the end of his composition to call in various specialists in organ construction with a view to modifying his score where, as written, his advisers considered it unplayable. Or imagine such a man producing a moderate work instead of a possible much finer one, because of his lack of knowledge of the capabilities of his instrument. An architect who in matters vitally affecting his design relies on the advice of specialists instead of making himself conversant with all the subjects concerned is acting in a somewhat similar manner, and runs a similar risk.

Let us consider the chief of those subjects that are thought by many to be too unimportant and too prosaic to be worth the close and thorough attention of the exponents and students of architecture. Take, for example, the comprehensive requirements of the building law in our larger towns, and more particularly in London. Here we have an elaborate code which very materially affects the erection of every building. Consider an ordinary domestic building on an ordinary site, and it will be found that the position, height, and construction of the building will be very materially controlled by the requirements of the building law or by-laws. The building, for instance, must not extend beyond the frontage line; it must have the requisite amount of air-space at the rear; it must not, if situated in London, extend above the diagonal line; its walls must be of specified materials of specified thickness; its system of sanitation must be designed and constructed throughout in accordance with specified rules. All these points are met with in the design and construction of a building of ordinary everyday class. In dealing with special buildings further requirements are encountered. Large public buildings, for instance, are required to be planned so as to afford reasonable means of escape in case of fire, and to be of fire-resisting construction. In London the means of escape requirements apply to a very large class of buildings, and there are also special constructional requirements affecting warehouses, shops with dwelling-rooms above, tenement buildings, &c.

These numerous and far-reaching requirements have a very considerable influence on the buildings that we design. Possibly some of such requirements are open to criticism. If so, by all means let us have ample criticism, and, if it is

found to be justified, let us get the offending requirements either rescinded or amended. But the bulk of the requirements will doubtless withstand the fire of criticism, and in any case we are bound to conform to all requirements existing at the moment, whether good or bad. Seeing that this is so, surely it is not unreasonable to suggest that it is the business of every architect to have a good working knowledge of the requirements in the district in which he practises. But what percentage of London architects are well acquainted with the London building law?

It is becoming to be a generally accepted axiom by modern writers on architecture that the study of any style is of value in direct proportion to the pains taken to understand the spirit of which the architectural forms are the outcome. A consideration of Greek architecture will show a thorough appreciation of just limitations to have been one of the predominant characteristics of Greek designers. It may seem rather venturesome to suggest that the modern exponents of the Neo-Grec should, as one of the principal bases of their work, take to a study of the building law. Yet I cannot imagine a Greek architect commencing to design a building while having but a hazy idea of the requirements governing his work. In fact, a Greek architect with hazy ideas on any branch of his work is almost inconceivable. The clear-cut intellectuality of his age could not brook the kind of half-knowledge which to-day is so prevalent.

But it will doubtless be said—remarks to this effect are of everyday occurrence—that it is impossible for the average architect to become familiar with requirements so comprehensive in character as those applying in London, and that, after all, there is no real need for the architect to bother his head too much about such matters; if he goes wrong the district surveyor or the London County Council officials will soon put him right. In regard to the first of these two assertions, it must, of course, be admitted that a detailed knowledge of every single requirement is out of the question. Neither is such knowledge necessary to any person; for the details of any requirement every careful person will consult the exact text of the Act or by-law in question. But a general knowledge of the requirements is a very desirable acquisition, and is not a matter of very great difficulty. But close attention and study is, of course, required; it is not possible to become well grounded in any subject without concentration, and the London Building Acts cannot be mastered in a spirit of absent-mindedness.

As regards the assertion that the administrative officials will prevent the architect from contravening any requirements, this as a simple statement may be accepted at once. But as for the implied suggestion that their action will operate favourably rather than otherwise in regard to the building in question, such a desirable result will not occur in one case out of twenty. What most frequently happens is that the architect who is not well acquainted with the building requirements. What is to be done? The client is grieved to such requirements. When he has succeeded in obtaining a satisfactory design from his client's standpoint, and there are immediate prospects of the building work being commenced, he submits his plans to the local surveyor. If he is lucky perhaps only a few small modifications will be necessitated. But not infrequently he has the mortification to find that his building as planned contravenes a very important requirement—it extends in front of the general building line, or it has not the requisite open space at the rear, or the means of escape in case of fire are inadequate, or in some other important respects it is contrary to the building requirements. What is to be done? The client is impatient to get the building started. The architect has not the heart to spend a great deal of time in reconsidering his planning in the light of his new and dearly bought experience. The local surveyor is principally concerned in obtaining a compliance with the requirements. If this can be done without impairing the efficiency of the building he is admittedly pleased, but if it cannot he philosophically and rightly reflects that it is not his fault. All things tend to what in many cases are practically the inevitable. The pruning-knife is requisitioned. The design is ruthlessly lopped and carved here and there to make it conform to the requirements. The architect henceforth is convinced that all by-laws and building requirements are made solely for the exasperation of the profession. It never enters his mind that he is to blame for not having made himself acquainted with the requirements affecting his work.

The mention of the procedure of cutting back a building brings us rather naturally to the subject of the law regarding rights of light. This, like the building law, is often

considered to belong rather to the domain of the surveyor than that of the architect. But the great effect which this branch of the law has on the erection of buildings surely places it among the most important practical branches of an architect's study. Thousands of buildings are erected every year of which the heights, and thus to some extent the character of the elevations, are governed by the rights of light of neighbouring buildings. Architects should surely know to what extent they are able to build when concerned with a site thus subject to serious restrictions. Although the cases decided by the Courts are legion, yet, thanks to the decision of the House of Lords in the often-quoted case of *Colls v. Home and Colonial Stores*, the law on the subject is not unduly complex, and is within the understanding of any person who cares to give a little time to the study of it. An architect ought to have a reasonable acquaintance with the law on this subject, so that he can tell whether he is keeping within safe limits or whether the building that he proposes to erect is one of those on the borderline between what is and is not permissible. In dealing with a site subjected to rights of light it will often be necessary to make the maximum permissible use of the site, a borderline case being in such instance the obvious primary objective of the architect. Then, in the subsequent negotiations with representatives of the dominant neighbouring owner or owners, he can feel his way, and, if necessary, make some little concessions in order to dispose of any opposition that may be encountered. In matters of this kind an architect will surely produce a better building if he has a sufficient knowledge of the subject to enable him to act independently, and is not compelled at every stage to go to an expert for guidance.

A great deal of attention has recently been given by the profession to the law of contracts as affecting architects. It is undoubtedly a very important subject, although from the standpoint of architecture it may be considered to be of less vital interest than the subjects of the building law and the law as to the rights of light. For it is quite conceivable that an architect might erect a succession of fine buildings under forms of contract of hopelessly unsuitable and inadequate character. Or an architect might possibly delegate the whole of his work of this nature to his solicitor, and his buildings might be none the worse. But it is obviously not to the interests of the profession, and thus indirectly not to the interests of architecture for architects to gain a reputation for lack of business ability; neither is it desirable to allow any of our legitimate work to fall into the hands of lawyers. The law of contracts as affecting both the building owner and contractor, and the architect and client, is therefore a necessary subject of study for practising architects and for aspirants to the profession. There is also one special aspect of the study of various legal branches of our work which should not be overlooked. Familiarity with the interpretation of the law as expressed in the judgments of the Courts tends to produce an appreciation of the just value of words. In the majority of building cases, except to some extent those regarding rights of light, the decision depends almost entirely on the construction of a clause in a statutory requirement or contract, or in the interpretation of a judgment in a previous case. It is impossible for a person to give much attention to legal decisions without acquiring, unconsciously perhaps, a clearer form of literary expression. The value of this is, of course, considerable, having regard to the amount of correspondence which an architect's practice necessarily entails. Also it may be not unfairly contended that the habits of precision thus established are no inconsiderable asset in the practise of what has been termed the most sane of all the arts.

We now come to the question of construction. As regards those branches of the subject which are embraced within the work of the main building trades, the modern architect has generally a very sound knowledge. Indeed, in the case of brickwork, carpentry, and joinery it is not too much to say that many architects know much more of the technique of these subjects than the average mechanic. And that this is so is one of the hopeful signs in modern architecture. But how about the important matters in the erection of a large building which it is the custom to include in the general term "engineering"? Here it is quite the exception to find that the architect is sufficiently familiar with the work to be able to design and control it in all details. He usually is compelled to place such work, and thus to some extent his own reputation, in the hands of specialists. To a certain degree this action is justifiable. So many special matters are encountered in the construction of large modern buildings that it is quite impossible for an architect of other than most exceptional attainments to be thoroughly well

acquainted with them all. There is, however, a distinct line beyond which an architect ought not to go in delegating his work to specialists. If the special work is such that it can have no material influence on the general design and construction of the building, the specialist may be employed. Such matters as the technical details of electric lighting and hot-water heating of ordinary buildings may not unreasonably be delegated to specialists, for if this is done the resulting work will often gain by the arrangement. But, on the other hand, if the work is such that it affects the design of the building, the architect cannot rightly delegate it to anyone.

(To be concluded.)

MARBLES USED IN GREEK, ROMAN AND BYZANTINE BUILDINGS.*

(Concluded from last week.)

Up to the present we have seen but a faint reflection of Byzantine art; for the art itself we shall have to fight our way into Eastern Europe, where it appeared at the beginning of the sixth century so completely developed that we might imagine it to be of spontaneous origin, did we not believe in the theory of artistic evolution.

From what is known of the marbles used by the Romans, and with the aid of that remarkable description of the Church of Sta Sophia, Constantinople, written by a Byzantine poet in 563, there has been no great difficulty in identifying most of the marbles that still enrich the crowning glory of Justinian's efforts.

To what extent the builders of that church availed themselves of secondhand materials we shall never know, but we may assume that the idea of bands and panels for the plating of the nave was derived from Rome. The bands of the plating in the nave are generally lighter than the panels, but just above the skirting of the ground floor and that of the galleries is a well-defined band of Thessalian green. The use of alabaster, translucent and golden, for the lighter bands is remarkable; no doubt it gives a rich mellowness to the plating, and it may have softened the brilliance of the gold that is said to have been applied to the sculptured parts of white Proconnesian marble.

Although the possibility of a lavish application of gold to the sculptured parts cannot be overlooked, in view of certain literary evidence, it has not been proved, and the traces of gold and blue on the minor features of this and other Byzantine churches cannot settle the question.

A striking feature of the lower storey is the zone of black and red panels, with carved framing, that repeats in a measure the richness of the arcades.

All other churches pale into insignificance when compared with that of Sta Sophia, yet it is interesting to note how the decoration of the larger church served as a type for others in Constantinople and Greece down to the eleventh century. In these there is the same flat treatment of bands and panels; but, generally, instead of a brilliant edging of notched fillets, we find plain beading, occasionally cut into "bead and reel," around the panels.

Returning to the western shores of the Adriatic, in the seventh century, we shall find architecture not at all in a flourishing condition; and in the following century the proto-Byzantine style of Italy was altogether extinct. The Italian architects were thus left to their own resources, and the result was a mixture of Italian and Byzantine elements, architectural development chiefly depending on the former, decoration on the latter.

Excepting parapets, ciboria, capitals, and archiepiscopal thrones, there is but little marble decoration of this period to interest; the evolution of a new style was in progress; the transformation of the Italo-Byzantine into the Lombardesque.

In renovating the ninth-century basilicas the Lombardic architects retained the Italo-Byzantine marble enrichments, adapting them to the new conditions. Sculptured parapets, from screens and ambos, were set in the external brickwork as decorative panels: marble columns were multiplied for external arches and arcades; and triangular slabs of antique vari-coloured marbles were applied to brick friezes, as at the Cathedral, Murano.

The Italo-Byzantine work at Torcello, though inferior to the proto-Byzantine work at Ravenna, cannot be overlooked by the English student who has felt the inspiration of "The Stones of Venice."

* A Paper read before the Architectural Association on Nov. 11 by Mr. J. A. Marshall.

Unlike any of the other churches mentioned, the Cathedral of S. Mark in Venice has its exterior as well as the interior cased with marble. This peculiarity is mainly due to the fact that the Greek architect who planned the building had no hand in its decoration. He certainly did not dream of casing the outside with marble; though no doubt he assumed that the interior would be so treated, probably in the manner of those churches in Greece and the Far East that exhibit fully-matured schemes in strict conformity with the structural lines of the building. This unity of purpose was not, however, destined to be realised; and, as Ruskin has said, "the church of S. Mark became rather a shrine at which to dedicate the splendours of miscellaneous spoil than the organised expression of any fixed architectural law or religious emotion."

When the structure was finished in 1071 agents were sent everywhere for marbles for the paving, but thirteen years later this elaborate tessellation was still unfinished.

The columns are mostly slender shafts of Proconnesian marble, sometimes suggesting in their veining the transverse markings on the stem of a silver birch-tree; but in the shadow of the aisles are clustered some venerable and sturdy shafts of grey granite, probably brought from a Byzantine church in Sicily for the earliest basilica at Venice.

Although S. Mark's is a church of two storeys, the marble plating of the interior rises nowhere higher than the parapets of the galleries. The arrangement of the slabs is generally artless, without any definite scheme beyond that imposed by using secondhand material in the simplest possible way; and it could not be more opposed to the expression of organic construction. The slabs are merely fixed side by side, in tiers, like vertical strips of boarding, with the veining "opened out."

Looking beyond the columns of the nave we see on the walls of the aisles the rich effect of studied design. Instead of monotonous ranges of narrow slabs, the long stretch of plating, up to the string at the level of the capitals, is arranged in seven upright divisions, defined by different marbles. Above the string the white Proconnesian frieze is enriched with the well-known series of mosaic panels that suggest enamelled plaques of the twelfth century.

Comparing the arcades of S. Mark's with those of Sta Sophia, Constantinople, and the Siculo-Norman churches, the Venetian example seems to suggest a compromise in the manner of its decoration; for, instead of the arches being entirely cased with marble or covered with gold, the conditions seemed to necessitate the use of both materials, the mosaic being confined to the underside of the arches by the marble architraves.

The little chapel of S. Isidore, at the end of the north transept, has a special claim on attention. Finished in 1355, it exhibits the characteristics of Venetian art at its best. Below the string at the springing of the barrel-vault, gleaming with gold, the side walls are plated with large upright slabs of Proconnesian marble, alternated with narrower strips of purple porphyry, and the green breccia of Thessaly. An unmistakable Venetian touch is seen in the little piscina, with its Arabic arch and roundel chiselled into a Byzantine fancy. Contrasted with this simple and flat decoration is the vigorous expression of the Pisan school, at the east end of the chapel, where the sculptured tomb of the saint occupies a recess behind the altar.

Local marbles, though not unimportant in the decoration of S. Mark's, became more prominent during the progress of the Venetian style, and in Verona and the cities of Tuscany they were exclusively used for external decoration in a way quite original. The limestones were got chiefly from the hills around Verona. The quarries were worked by the ancient Romans, who, in the time of Diocletian, selected a flesh-coloured variety as a building material for the amphitheatre at Verona.

The façade of S. Mark's is bleached, and in many places the original tinting is obscured by corrosion and "the golden stain of time"; yet, when seen from the opposite end of the Piazza, the building presents a delicate suggestion of opalescence, heightened by contrast with the deep gloom of the porches. As you get nearer your attention is focussed on the four bronze horses that once stood in the agora at Chios, and you feel that the art of the Grecians is eternal.

You try to imagine the church first as it stood, for two centuries, without any decoration, and then when the lower storey, in the thirteenth century, was marked with the spoils of conquest, while the upper parts remained venerable-looking and bare.

You examine with interest the details familiarised by Ruskin half a century ago.

Finally, when you look at the later fantasy of the upper storey you realise that the exterior of S. Mark's was a reflection of the wealth and power of the Venetians, and that it stands alone, not only in the methods of its production, but in its final results.

Limiting our attention to the thirteenth-century renovation of the lower *façade*, as most relevant to our subject in point of date and purity of style, we note, firstly, that the main structural lines, due to the plans of the Greek architect, were followed, but the organic decoration, due to Lombardic influence, was entirely disregarded.

Before the renovation the central porch rose unrestrained, as it does to-day, but, for the new scheme, it was widened and thus made more important. The lavish application of columns to the piers may perhaps be regarded as an elaboration of Lombardic or Romanesque tradition, but the omission of arcading is without precedent, unless we admit the trabeated portals of Arles and S. Gilles.

To the thirteenth-century renovators are due those elegant extensions of the main *façade* that give a sense of security at the angles of the building. Respecting the plating, we note, where it is not obscured by columns, how it has been made interesting beyond the intrinsic beauty of the marble by using it as a background or setting for sculpture and panels. Plain unbroken spaces are avoided by some conceit strictly opposed to the natural lines of the architecture; if the space is a spandrel, it has a panel or niche in the middle of it; if a tympanum, the curve of the arch is opposed by straight lines; if rectangular, it is inlaid with discs, panels, and borders, like a pavement. Some of these compositions are artistically beautiful, others are ingeniously clever; though it is probable that many of the older sculptured slabs occupied corresponding positions on the brick fronts of the eleventh century, just as Lombardic panels are found decorating other churches of the Lagunar cities. The panels are invariably surrounded by borders of red or green marble, and the superficial character of the plating around them is candidly expressed by the use of narrow upright slabs. The influence of Byzantine refinement is also indicated by the absence of heavy mouldings, and the substitution of dentilled strings and archivolts and notched fillets.

The columns present a miscellaneous collection of marbles, but their disposition on the building shows that they were selected in some cases for their colour. Thus the central porch is made regal by shafts of purple porphyry, contrasted with others of white marble, and these support slender shafts of black and white breccia, now mellow with age. On each side of the central porch, facing the Piazza, are shafts of Thessalian green, and Greek or Proconnesian white, supporting others of white only. The disposition of the remaining columns is somewhat promiscuous, though it may be noted that those on the right of the main *façade* and on the return front facing the south are of richer marbles than those on the left and north; indeed, the south front, though restricted in length by a remnant of the old Ducal Palace, was always more important than that facing the north.

The interior of S. Mark's was the last in Italy to be plated with marble in the simple Byzantine manner, but the innovation, from the Byzantine point of view, of casing the exterior became an established practice. This reversal of the old order of things was due to developments in architecture, and to the rise of the various schools of painting. In the course of time marble decoration assumed more and more the forms of solid construction; its legitimate application was lost sight of, excepting a very brief period at the end of the fifteenth century, when the Lombardi of the Renaissance attempted to revive it.

It now only remains to glance at that peculiar phase of Byzantine influence on decoration to be met with in the churches of Sicily, built during the Norman occupation.

The result of a fusion of Byzantine and Saracenic traditions, this decoration is unlike anything we have yet seen. Apart from the richly-inlaid ambos, screens, and pavings of these churches, the marble plating is invariably limited to a high dado on the walls. Above the dado and the gilded capitals of the columns the walls and arches are entirely covered with mosaic.

The distinguishing feature of the plating is an Oriental or Saracenic application of geometrical patterns in glass and marble mosaic, a type of inlay repeated at Salerno, Ravello, and elsewhere, for pulpits, &c., and closely allied in style to the work of the "Cosmati" school of Rome.

The most beautiful example of Siculo-Norman art remaining in Palermo is the Palatine Chapel, built by King Roger II. in 1143. The chapel is small, and so are its windows, but when the eye has mastered the prevailing gloom

the effect is gorgeous, the mosaics scintillate, and the deep stalactite ceiling of the nave has a lurking splendour of purple, peacock-blue, and gold.

Of the same date, and similar in its decoration, is the church known as "La Martorana," in the same city.

After the mysterious beauty of these little churches the spacious and brilliantly-lighted interior of the Cathedral of Monreale is quite surprising. Built at the end of the twelfth century by the last King of the Norman dynasty in Sicily, this church is more transalpine in its decoration than the earlier churches in Palermo; yet this is not so evident in the marble decoration as in the art of the mosaic-worker and the sculptor. Indeed, the high dado all round the church differs only from the earlier work in having no slabs or roundels of porphyry, the plating being entirely the greyish-white of Proconnesus arranged in narrow slabs, with intervening strips of mosaic edged with plain white beading. The deep frieze, inlaid with mosaic of "arabesque," and varied pattern, is also repeated. The vertical lines of this dado adapt themselves to the curve of the apse as naturally as a curtain hung on the wall. The mosaic is threaded with thin lines of cream-coloured stone that soften the harshness of the vitreous tesserae, and have the same artistic value as the strips of pearl used in the inlay of the Arab work in Cairo, about a century and a half later.

Mr. A. E. Henderson said it gave him very great pleasure to propose a vote of thanks to Mr. Marshall. Knowing as he did a great number of the buildings mentioned, the lecture had made him realise how little he knew when he went there, and also made him wish to go again and study them with the eyes and knowledge of Mr. Marshall. The lecturer had refrained from mentioning any beautiful examples of marble in their own ancient city. But within a few hundred yards of the Association premises they could go and study those marbles, for in Westminster Abbey there was nearly every marble mentioned in the paper. If they knew more about the materials in the Abbey would they not admire it more? He had been very much impressed when he read how certain columns were moved from place to place. He wondered whether the enormous verd antique columns in Sta Sophia were there before the architect designed the building; that was to his mind very probable. Mr. Marshall had touched upon the difficulty of moving these columns in Rome. A similar case had occurred in London—Cleopatra's Needle. The surveyor to the Metropolitan Board of Works reported that he would not guarantee the safety of the sewers if it were moved to the British Museum. As to the best finish for marble, his (the speaker's) opinion was that it should not be brought to a wax polish, as it then looked tawdry. Alabaster was an exception. The weathering of marble was always interesting. Mr. Marshall had gone into the history of marble, but had not told them the best way to treat it in design. He could only hope that some day he would favour them with a paper on how to design marble decoration on walls. Old buildings did not represent modern ideas on the subject. They wanted to decorate walls in some fashion that would please clients and please themselves.

Mr. W. S. H. George said that Mr. Marshall had suggested in the first part of his paper that the Greeks did not use any other than white marbles. As a fact, in certain buildings they used black. The lecture also threw doubt on the use of colour, and suggested that it was only done to cover the grey streaks. But he (the speaker) had seen a lot of work just after it was dug up, and he felt sure that it had been originally coloured, and that that was quite the right thing. Colour was put on from the Archaic period to the best period of the Hellenistic Age. For instance, there was the sarcophagus of Alexander at Constantinople. He would like to plead for the use of colour on marble. Where it could be employed it was an added grace. To an ancient Greek a building without colour would seem like a concerto without accompaniment. Byzantine workmen were often far from perfect; they were quite clumsy in Sta Sophia, where there were many pieces of design which it was to be hoped no one present would pass. Students must recognise that the interest of Byzantine work was historical rather than that it would serve as a model. He felt sure that the Byzantines used colour and gold on white marble.

Mr. Horsley said that the paper seemed to him quite a standard work on the subject. He would ask Mr. Marshall if he would allow the very fine specimens of marble which he had brought with him to remain for a time in that room, so that members might inspect them under daylight conditions.

The vote of thanks was put to the meeting and carried with acclamation.

Mr. Marshall, in acknowledging the vote, said he had only touched on the fringe of the subject. But he hoped it would be at all events a starting-point for the younger members to commence their inquiries from. He entirely agreed with Mr. Henderson's opinion that marble should not be polished to the greatest degree it was capable of. His own rule was that the polish should be just sufficient to show the crystalline character of the material. He had been very greatly interested in the statues found in the Acropolis, and he had meant to imply that those statues were always coloured. In many temples where the decoration was painted it protected the surface until the present day.

THE NEW AUSTRALIAN CAPITAL.

By W. R. DAVIDGE, F.S.I., A.R.I.B.A., A.M.Inst.C.E.

THE laying out of the new capital of Australia is a subject in which the Garden Cities and Town Planning Association has taken the keenest interest from the time the idea was first mooted. The proposal is one that must meet with our unanimous support and sympathies, both in its successful floating and subsequent welfare.

For years Mr. Ebenezer Howard and the other pioneers of the Garden City movement have been urging—insistently urging—that the only satisfactory way of dealing with the huge growth of our towns is to start afresh on a virgin site free from the insistent restrictions and enormous cost which are involved by any improvement of existing towns. Still more advantageous is it when the proposal has behind it the full power of such a community as the Commonwealth of Australia, and when the community itself is sole owner of the new township and free from the clash of conflicting private interests, and, furthermore, with all the lessons of the past to know what to avoid. The idea of forming a capital city on such a scale is almost unprecedented in modern times; the nearest example is, of course, the planning of Washington and the surrounding Federal district of Columbia in 1790. Although not in any sense intended as a criticism, it is impossible in dealing with such a subject to altogether avoid giving some expression of opinion on the points touched upon. It is inevitable that on such a subject opinions on matters of planning and detail will be considerably at variance, and as far as possible the broad outlines only of the scheme will be considered.

The Commonwealth of Australia was constituted by the federation of the six Australian States in 1900. In order to avoid any idea of rivalry between the existing great towns of Australia it was determined that the seat of Government of the new Commonwealth should be situated in a special Federal territory to be formed, the stipulations being that it should be within the State of New South Wales and not less than 100 miles from Sydney.

After some years of careful investigation the district of Yass-Canberra was selected as the most suitable for the Commonwealth territory. One of the special requirements for the new capital was that its water supply should be entirely within the control of the Commonwealth Government, and hence the district was specially selected as one embracing a good catchment area of water supply.

The capital site itself at Canberra is situated on the Molonglo River, about 150 miles south-west of Sydney, the proposed water supply being obtained from the water shed of the Cotter River, distant some miles from the capital.

The site having been selected, a careful contour survey was made of the surrounding district, and public invitation given to architects and others to submit competitive preliminary designs for the lay out of the city and the allocation of sites for the principal buildings. A Board of three assessors consisting of an architect, an engineer, and a surveyor was appointed to examine the designs and report to the Minister for Home Affairs, with whom the final adjudication was to rest. In practice it will be remembered that in consequence of the objection of the Royal Institute of British Architects to this arrangement the English members of the profession held aloof from the competition.

The eventual award of the professional assessors was not entirely unanimous, one of them issuing a minority report with reference to the design selected by him.

The awards made were as follows:—First premium, £1,750, Mr. W. B. Griffin, Chicago; second premium, £750, M. Laarinen, Helsingfors, Finland; third premium, £500, M. Agache, Paris.

The design selected in the minority report was by a Sydney firm of architects, and this has since been acquired by the Commonwealth Government.

The first premiated design is, naturally, the one of most

interest. The scheme is almost entirely formal in character, and arranged in strictly geometrical pattern. The town itself, already divided into two by the river Molonglo, is to have two main centres, that on the north side of the river to be devoted to civic matters and that on the south to the buildings connected with the Commonwealth Government.

Dominating the south side of the river, on a prominent rocky spur from the Narrabundah range, is to be placed the Capitol, or executive Government building, the Parliament buildings being placed on a slightly lower eminence 90 feet below, and the various Government offices on successive terraces reaching down to the river front.

Around the central building of the Capitol is situated a circular central park rather over half a mile in diameter, and from the circular avenue surrounding the Capitol radiate eight main avenues each 200 feet wide. Two of these main avenues cross the river by means of bridges, one going almost due north to the civic centre and the other north-easterly to the railway station on the opposite bank. The axis line of the whole plan lies between these two main avenues, and is arranged to terminate in the summits of the mountain known as Ainslie to the north-east and the distant peak of Bimberi to the south-west of the city.

From the civic centre north of the river radiate six similar main avenues, and with the expansion of the town it is apparently proposed to construct further suburban centres at intervals of every two miles or so, with the same six or eight radiating avenues carried on almost ad infinitum—if no further.

Napoleon I. is credited with being particularly struck with the advantages of the "roundpoint" with a large number of converging streets in order to provide a spot at which, if necessary, cannon could be put to keep the people in order. The Commonwealth Government of Australia, in introducing such a system of streets radiating from the Government building, has no desire to keep such an eye on the people, but it is possible that the people may find the system of advantage to keep an eye on the Government.

In addition to the public buildings of the Government Departments provision is made in the design for a University building, Law Courts, National Gallery, Museums, Technical Colleges, &c., most of these being arranged on the northern side of the Molonglo.

The point that first strikes the observer in the prize design is the great use made of the river frontage. It is proposed by damming back the river to form a series of five large lakes along the whole front of the town, the total water area of the lakes being nearly five square miles. There can be no question but that if this can be done it will vastly improve the appearance of the city. The water frontage to the public buildings between the two main avenues before referred to will be nearly a mile in length, and the spectacle can be pictured up of terrace upon terrace of buildings rising from the water's edge up to the Parliament buildings, and crowning all the stately dome of the Capitol.

If the necessary water area for the lakes can be provided, this will be undeniably fine, but, unfortunately, there is some little doubt of its practicability. The Molonglo is a somewhat sluggish stream flowing between steep banks. The river is ordinarily very shallow, and during periods of prolonged dry weather the river ceases to run. Though in times of sudden rain the flow of the river is liable to be swollen by heavy floods, it is somewhat doubtful whether the summer flow will be sufficient to make good the evaporation of such a great area of water as five square miles, remove the risk of stagnant water or mud flats, and at the same time provide for sufficient flow in the stream below the city, into which the sewerage must naturally discharge.

Such a point cannot, however, be definitely decided without very careful observations of the flow of the Molonglo over a period of some years. It is much to be hoped, however, that this portion of the scheme will not have to be curtailed.

The flooding over the whole of the flat low-lying lands in this way may, however, awake too late the inhabitants of Canberra to the fact that they have flooded the only available site for the racecourse, which is such a popular feature of Australian towns.

Many economies will undoubtedly be possible in the actual execution of the work, particularly in the construction of the roads. Numerous instances exist in which thousands of pounds could be saved by a slight rearrangement of the roads or relaxation of the rigid geometrical pattern. The formal framework of triangles, circles, and octagons has been most skilfully adapted to the site, but it is impossible to thus attempt to tamper with Nature and rule the hills into line without vast expenditure of money.

The great width of the main avenues is followed out in proportion in the ordinary roads, although, of course, to nothing like the scale of the spacious 200-foot wide avenues. Such roads and avenues will naturally be exceedingly costly to construct and maintain, and the Federal Government would do well to take note of the example of Germany, where the huge cost of roadmaking has forced up the price of land to an almost prohibitive figure and compelled the barrack-like form of tenement building in place of the low bungalow type beloved by the Australian.

The circular ascents shown on the plan in lieu of the zig-zag method of running a road up a hill are distinctly clever, and show one method in which the formal circular outline may be used to practical advantage. The distances from point to point in the city have already been touched upon, and the placing of the railway station at a distance of a mile and a half or so from the centre of the town will undoubtedly require reconsideration. The position of the railway itself, too, seems to preclude any rapid development of the south-western residential district, the inhabitants of which will apparently be more than three miles from the nearest station, unless an additional railway line is constructed. In any case, too, the sharp curves in the railway to suit the line of the streets will require reconsideration in actually laying down the design.

The subsidiary roads are almost entirely arranged in grid-iron fashion, regular rectangular blocks occurring along all the radiating avenues, the intersections of the radiating streets being modified by construction of streets in octagonal or hexagonal pattern, in every case strictly geometrical and with but very slight consideration being given to the contours of the land.

In this matter of radiating streets we seem to be very little advanced since the days when Carlsruhe was laid out a couple of hundred years ago, and this same octagonal arrangement of the streets surrounding the various centres is seen in Wren's plan for London and in the Far Eastern one-time Russian town of Dalny. Let us contrast this with the charming irregular lines of the older German cities and the delightful way in which the picturesque corners and quaint nooks can be made to provide a fresh feast of delight to the artistic eye. The vision, too, of these unending circuses and star points spreading in the future far away into the distant suburbs awakes one to the octopus-like growth of every one of our great cities and the necessity for girdling them round with an open belt of country to give some little breathing-space to the workers and travellers ere they plunge from one seething pot of a town into the seething cauldron of the next.

The Commonwealth authorities would do well, too, to consider the question of possible land speculation very carefully. The earlier years of the city of Washington are stated to have been very much hampered by speculators, who bought up all available land, and held it up at high prices, thus greatly retarding the growth of the young city.

The community, as themselves the owners, will in this new city have a great opportunity of keeping absolute control of the building and growth of the city, and if they are wise they will not lightly let out of their control, by sale or otherwise, the powers which they at present possess.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE opening general meeting and smoking concert of the Leeds and Yorkshire Architectural Society was held at the Queen's Hotel, Leeds, on Thursday evening, November 21.

The President, Mr. A. E. Kirk, occupied the chair, supported by Mr. J. F. Walsh and Mr. G. F. Bowman (Vice-Presidents), and Messrs. J. W. Connon, H. Perkin, W. Carby Hall, H. S. Chorley, S. D. Kitson, and a number of members, associates, and friends.

The proceedings opened with the President's Address, followed by a vote of thanks from Mr. S. D. Kitson, seconded by Mr. H. Perkin and supported by Mr. G. F. Bowman.

Prizes to successful students in the annual competitions were then distributed. Mr. W. Butler was awarded a £3 3s. consolation prize for measured drawings of Newland Hall, near Wakefield, the silver medal not being awarded.

The first prize of £3 3s. for design was awarded Mr. W. Voelkel, and the second prize to Mr. Douglas Bowman.

The Society's sketching prize of £2 2s. was awarded Mr. C. B. Chadwick, who also received a £1 1s. prize from the Sketching Club.

An excellent concert, arranged by Mr. D. Bowman, filled

up the rest of the evening, Mr. F. D. Whitehead presiding at the piano. Proceedings terminated with a vote of thanks to the artists by Mr. T. Butler Wilson, whose speech was most amusing, clever, and a fitting end to an enjoyable evening's entertainment.

Mr. A. E. Kirk gave the following Presidential Address:—

Gentlemen,—I should like to thank you for the honour you have done me in electing me your President. I feel the responsibility, and can assure you that I shall do all in my power to help on the work of the Society. I wish to thank our late President on behalf of the Society for the enormous amount of energy he put in during the two years of office. Upon the Hon. Secretary's shoulders fall all the work of the Society, and I wish to say how much we appreciate all that Mr. Whitehead has done for the Society; he is most businesslike and methodical. Among the many duties which fall to the lot of a Secretary, that of arranging the syllabus for the winter session is not always the easiest. After carefully selecting a dozen well-known men and writing and offering them dates, the poor Secretary finds that most of the dates clash, and that he has the greatest difficulty in fixing up his programme. I am glad to say that our Secretary has overcome all these difficulties this year, and has arranged a most interesting syllabus. You will notice we have arranged that there is a three weeks' interval between lectures; this gives fewer lectures, and by so doing it is thought that better attendance may be obtained. With regard to the attendance of late, I may say for the last few years it has been bad. Why it has been bad it is difficult to say; some thought that the time was inconvenient, some said that holding the lectures in Park Cross Street was not very central. We have tried different times, and also different places, for meeting, but without marked effect. This year they will be held in the Leeds Institute at the usual time, and I do hope that all, and especially the students, will make an effort to attend. One paper which should interest the students is provided by two of our members, Mr. Foggitt and Mr. de Jong, who are giving an exhibition of their work in Italy, whilst travelling as Tite Prizeman and Soane Medallionist. During the summer the Society, along with the York Architectural Society, visited the new Training College at Beckett's Park. Our Society visited York as the guest of the York Architectural Society, and visited the Treasurer's house, Museum Buildings, and an exhibition of Moore's pictures, which proved most enjoyable. I hope that similar excursions may be arranged next year, because at such gatherings we meet professional brethren, and are able to discuss matters of mutual interest. The work of the Sketching Club, I am afraid, has been spoilt by the fearful weather, but visits have been made to Anathorpe Hall, Whitkirk, Antwerp, and Edinburgh, and some very interesting work done.

I am sorry to say that there has been a lack of competition for the Society prizes this year. Probably that may be explained by the large amount of work now expected from the student. Next year it is proposed to utilise the R.I.B.A. design for the Society's class of design, and by so doing it is hoped that there will be a large entry. The silver medal for measured work has not been awarded this year, only one set being submitted by Mr. W. Butler for measured drawings of Newland Hall, near Wakefield. The drawings are neatly executed, but some of the full-size drawings do not scale the figured dimensions, which shows lack of care, and it is a pity that the staircase, mantels, and plaster work have not been measured. The Council have awarded Mr. Butler a consolation prize of £3 3s. In the design class the competition has not been so good, but some clever work has been submitted. The first prize goes to Mr. Voelkel and the second to Mr. Bowman. The subject set for construction was not a very difficult one, but there again no designs have been submitted. The sketching prize has only produced one set of sketches; this perhaps is accounted for by the bad weather this summer, and only one set has been submitted for the Sketching Club prize. Mr. C. B. Chadwick has been given both prizes for some very clever pencil work. There is no competition for the essay prize, which is very disappointing. The subject was "The English Garden: Its Features and Furniture," which, I should have thought, was a most fascinating subject. This year commences the revised arrangements for the R.I.B.A. examinations, the principal features of which are schemes of designs for Final, also inclusion of designs in the Inter. This shows more consideration for the subject than in the past, and puts design in its proper place in the examinations. The thesis for the Final gives great opportunity for individual work.

I should like to bring to the notice of the junior members of the profession the formation of an Insurance Approved Society by the A.A., Surveyors' Institute, and R.I.B.A., particulars of which can be obtained from the Hon. Secretary. The establishment of a British School at Rome is an accomplished fact, the particulars of which have been published. This should be a great incentive to the students to spur them on to gain the highest reward. It is to be regretted that the Architectural School at the School of Arts, Leeds, has not the privilege of nominating a candidate, but it is hoped that some day it may be won by a Leeds student. The Leeds School of Architecture, under the direction of Mr. Coombs, is doing very good work, and a very thorough training is to be gained there. There are rumours in the air that the city contemplates at an early date making provision for all the different departments of the city being housed in one building. Since the Municipal Buildings were built Leeds has increased, and naturally the different departments have expanded and new ones have been created. At the present time they are scattered all over the city, which means not only extra work for the officials, but also great inconvenience to the general public. Many sites have been suggested in the Council, and also in the Press. Of course, most of the criticism has been based on the cost regardless as to the suitability of the site.

I know that this is a most important matter, but, seeing that the scheme will require something like a quarter of a million to carry out, surely that which would add to the dignity of the city with such a large outlay at stake, and a less advantageous site, is not worth considering. Whatever is done should be worthy of the city. Bradford, our next-door neighbour, is going in for an extensive scheme of town planning in the very centre of the city, and, unless Leeds wakes up, it will be left behind. To my mind, and I think you will agree, the only site for such a building is on the south side of Victoria Square. This would give a glorious opportunity of architecturally treating Victoria Square, and making it worthy of the city. If these buildings are put elsewhere I am certain that Victoria Square will be left for all time a desert of cobbles with a small oasis in the centre—Mr. Brock's statue of the late Queen Victoria.

The enlargement of the General Infirmary will do great things by opening up the north side of the Town Hall. Mr. Kitson's plan shows a small square and gardens, which promises to be an interesting lay out. Just a word with regard to the town planning which comes into this large scheme. The plan shows a fine wide street running from Calverley Street in a crescent joining Fenton Street at Carnaby Street, on the south side of the artillery barracks. This seems to finish nowhere for a street of such importance. I would suggest that it be carried forward to where Hilliary Street joins Woodhouse Lane, and a circus formed there, then the traffic would be diverted from the tram-lines straight into the centre of the city, and I think that better gradients than Woodhouse Lane and Cookridge Street could be obtained. I know this is going beyond the present infirmary scheme, but I think in a piece of town planning of this magnitude there should be some finality shown to a street of this importance.

A new curator has been appointed at the Art Gallery, and Leeds has been lucky to obtain the services of Mr. Rutter, under whose guidance the whole Gallery has been renovated, the pictures re-hung, and the sculpture rearranged; the effect is most pleasing. I hope at some future time we may have the pleasure of hearing a paper read by Mr. Rutter, or, better still, if he would be persuaded to take the Society round the Art Gallery and criticise the different schools of painting shown there it would be most interesting and instructive to us all.

A review of the past year's work amongst our members is not very inspiring. The trade of the country, as shown by the Board of Trade returns, is good, all industry being fully employed except the building trade. It is said that the building trade is always the last to feel depression, and the last to benefit by the revival. During the last few years that is certainly true; there seems to be a great lack of confidence in the public to invest money in the land and buildings. Leeds, in common with other large towns, was largely over-built during the last boom, and here builders were deceived by the rate of increase of population, which, as everyone knows, fell far short of expectations when the census was taken. I trust that during the coming year the building trade will feel the industrial revival, and that we shall all be fully employed.

The most important building enterprise in the neighbourhood, the City of Leeds Training College, has been finished this year, and is now occupied. The grouping of

the buildings is most satisfactory. No pains have been spared in working out the smallest details. As a modern educational institution it can be said to be the most perfect of its kind; already it has been visited by distinguished educationalists from all parts of the world. Leeds is to be congratulated on the enterprise and energy displayed in being able to carry out such a large scheme successfully.

That hardy annual registration again occupied an important position in Mr. Blomfield's Presidential Address before the Institute, and I think he strikes the very note of registration when he states, "A sound and thorough professional training is the basis on which any form of registration must be founded. If we are to obtain public and formal recognition of the fact that architecture is not an art that can be practised by Dick, Tom, and Harry with advantage to the community, and that there is a difference in kind between the work of the trained designer and the architectural efforts of the gentleman who combines the practice of architect, auctioneer, and estate agent, we shall see to it not only that our present standard is maintained by all who enter our ranks, but also that it is slowly and surely raised, so that there can be no question as to who is or who is not qualified to undertake the work that legitimately falls on to an architect."

The Institute is pledged to the policy stated in the Report of the Committee of 1907, but very little heading has been made during the last four years. Of course, I know the subject bristles with difficulties, but many converts are being made every year. We in the provinces have perhaps felt the necessity more than the London men, but I am glad to think they are coming over by degrees. The new Council have appointed a large and carefully-selected Committee to consider the whole question, which contains, I am glad to say, a number of representatives from the provinces, and I sincerely trust that their deliberations will bear early fruit.

A circular letter from the R.I.B.A. has been sent to all the allied societies stating that the Council are anxious that the control and supervision exercised by the allied societies all over the country should be as complete as possible, and that some of the provinces allotted to them are too large and that their organisation cannot adequately deal with more than a certain area. They also drew attention to the fact that there are a large number of members and Licentiates of the Royal Institute who do not belong to the allied societies, and ask for suggestions to improve this. With regard to our own Society, a fair number of Fellows and Associates who reside in our area are members of the Society, but the percentage of Licentiates is not so good. The figures are as follows:—25 members, 5 not; Associates 35 members, 10 not; Licentiates 18 members, 62 not. Leeds, I think, is well situated as a centre for the majority of the towns represented. If it is proposed to create additional allied societies I would suggest that Yorkshire should follow the Ridings, which would then be as follows, viz.: York and North Riding, Hull and East Riding, Leeds and West Riding. To obtain more supervision and influence over the provinces it would seem necessary that all members of the Institute should become members of the allied societies. In the case of Fellows and Associates I do not think there would be any opposition, because the R.I.B.A. refund their subscriptions. With regard to the Licentiates, there may be opposition, unless the R.I.B.A. can see their way to refund the necessary subscriptions, which I think they most certainly should do. There is a feeling abroad, I know, that many of the provincial members obtain very little benefit from their membership of the Institute, and I think something might be done to allay this feeling, say, by conferring certain grants to the allied societies.

Now let us look at the general condition of things in the twentieth century. The age of despots is past. Englishmen are never in the future likely to live under any more grinding tyranny than the caucus. Workmen are no longer slaves, even though they care quite as little or less about their work. The days when the prelates of powerful Churches, or the despots of petty kingdoms, could employ the untold labour of their serfs in carrying out the architect's dreams have gone for ever.

As Mr. Ruskin has said, "For us there can be no more the throne of marble, for us no more the vault of gold; but for us there is the loftier and lovelier privilege of bringing the power and charm of art within the reach of the humble and poor; and, as the magnificence of the past ages failed by its narrowness and its pride, ours may prevail and continue by its universality and its lowliness." Some few are called upon to do great things like the Cathedral at Liverpool or the County Offices, London. But, as a rule, we must be content to do simple things, and to do those simple

things as well as in us lies. Buildings of unlimited cost are now out of the question. Everyone who wishes to build, wishes to build with due economy; be it our aim to help him to build art also. The time of the workman now means, to put it in one word, money. We have to provide buildings simple and good. And the importance to the architect who should succeed of knowing precisely how and when to place rightly every shilling of expenditure on his building, whether of mouldings or ornament, sculpture or painting, has increased of late a hundredfold. Unlike the painter who places his creations at once upon the canvas or the sculptor who petrifies his ideas direct into marble, the architect has to produce his idea direct on paper and then to influence his materials by the hands of others. We cannot send houses and churches to the Royal Academy, and the architectural room there would be a more direct exhibition of architecture if it consisted of photographs of executed buildings. Drawings of some of the best architectural works are sometimes rejected, because not drawn as coloured pictures. I am glad that the Royal Institute has at last taken photographs into consideration for the elections to the Fellowship, because, to my mind, there is no better way of illustrating executed work. The great historical knowledge of architecture arising from the increase in the number of books and photographs has given rise to more and more downright copyism, some clumsy adaptation, and a serious amount of architectural muddle in buildings. Rightly used, books and photographs ought to produce a greater consensus of knowledge, and should enable men to think more freshly and design more freely.

Mere "eclectic" building, however clever, only renders more conspicuous the absence of design and creative power. If you wish to produce, and intend to produce, good art you must endeavour to understand first of all that you will never get paid for it. The pleasure you have had in it must be to yourself all the reward you will receive. You will, of course, be paid your percentage calculated on the sum which the builder has received for his part of the work, but you will receive this all the same if you work with the mind of the tee-square and compasses, and not in the spirit of the artist. The art in your work depends wholly on the pleasure you have taken in it, and has no market value.

Creative art can never be produced by rules, however necessary. We cannot always be repeating the wisdom of the ancients. Times change. New wants of time arise. The artistic perception in relation thereto grows clearer. There is no rule without an exception, and he who has passed into the inner sanctuary behind architectural rules and canons may sometimes break them with advantage.

The future will tell whether the present has its architects able truly to write history on the wall. The palmy days of Greece contrasted the perfect beauty of the temple in its noblest architecture with the hovel of the present in its lowest squalor.

In this England of ours to-day power is passing from the noblesse to the masses. Art, if any is to be left at all, must belong to the people, powerfully influencing by its universality their homes and lives. The mission of the architect is no longer to give expression to extravagance, but rather to educate by the truthful, intentional houses of the poor, and to all honest, substantial art with simple wants. He who most truly reads this is most in harmony with the spirit of the age. He who succeeds best without affectation in producing simple artistic work fit for the domestic life of England does most to discredit the modern shame and silly pretty trumpery which beats us on all sides and best paves the way for a new era in English architecture.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Open Letter to the Royal Institute of British Architects.

GENTLEMEN,—I earnestly appeal to you to use all your influence to bring to an end the evil custom of publishing the names of assessors in architectural competitions before the designs are sent in to be judged. The practical outcome of publishing the names beforehand has been to prevent many from competing who have felt unable to sympathise with the taste and ideals of the assessor. But the greatest evil of all is that men are induced to design up or down to

the assessor's level. Not setting out to do what they honestly feel to be the very best they are capable of, but for the sake of the reward, to prostitute their powers by endeavouring to appeal to the taste of the assessor. Let no competitor know who is to be his judge, and you at once remove a powerful inducement to unfaithfulness. It is a fearful tyranny that imposes any style on a designer. Conditions and requirements and moral law are enough data from which to produce the noblest architecture if properly attended to, assuming, of course, some degree of native refined sensibility. But when any style is imposed upon the designer the conditions and requirements that ought to control him are made subservient to the style. The plan has to be squeezed like a Chinese foot, and the honest expression of needs is sacrificed to the conventional commonplace of symmetry. The supposed leaders in the profession by this system can impose upon the British public the deadly dull imitations of the style they affect. Hence we have seen public buildings arise one after the other with the same trail of the serpent over them all. No healthy national style can be artificially grown in this way.—Yours faithfully, C. F. A. VOYSEY.

Fire Protection in London and the London County Council.

SIR,—The coroner in summing up at the Kensington fire inquest on Thursday, November 21, is reported to have spoken as follows:—

"The calamity made one wonder how many other buildings in London were in the same condition as they were told Messrs. Barkers' premises were; how many negotiations were going on, and how many buildings were waiting before the necessary alterations were to be made."

I wish to take the earliest opportunity of publicly replying to these questions. There are upwards of 50,000 buildings in the metropolis at the present moment to which the London Building Act Amendment Act of 1905 has not yet been applied.

Although this Amendment Act has been in force now for upwards of seven years, the superintending architect of the London County Council, giving evidence before the House of Commons Committee on the London County Council General Powers Bill (1912) in June last, stated that only 2,330 buildings had been scheduled for action at that date, and that the Building Act Committee of the London County Council had only considered 1,203 of those cases. Of these 1,203 cases only 527 had at that date been satisfactorily equipped by the provision of suitable means of escape, and the balance were in what might be termed a state of negotiation.

That so few buildings (527) should have been put in order out of approximately 50,000 cases in the long period of seven years is a matter of gravest import, but the balance should not in any way be attributed to the superintending architect or his officers, but specifically to the London County Council in its corporate capacity, which does not give its Building Act Department either the necessary means, the necessary staff, or the necessary encouragement to carry out the requirements of the Building Act Amendment Act energetically and promptly.

It is not for me to go into the reason why the County Council should apparently have been so adverse to allowing its officers to carry out their obvious duties, but the fact remains that indirectly the responsibility for lives lost in such buildings as the Barker establishment must fall on the shoulders of the authorities rather than the building-owners, who, owing to the Council's known apathy, practically consider the Amendment Act of 1905 a dead-letter.

Thus the short reply to the coroner's question is that quite an enormous number of buildings in the metropolis are in the same condition as the one which was under review at the inquest—that but very few negotiations are going on as to remedying this state of affairs, and that quite 50,000 buildings are waiting for the necessary alterations to be made.

It is to be hoped that the Barker fire will awaken the London County Council to its duties in this particular matter. With the necessary staff and facilities, and with the diligence which the County Council occasionally applies to other departments of its work, the outstanding 50,000 buildings should be put in proper order within the next five years.—I am, Sir, yours very truly,

EDWIN O. SACHS.

FORTHCOMING EVENTS.

Monday, December 9.

Architectural Association : Joint Meeting with the Art Workers' Guild, at 8 p.m.

Tuesday, December 10.

Royal Academy of Arts : Distribution of Prizes to the Students, at 9 p.m.

Wednesday, December 11.

Edinburgh Architectural Association : Associate's Paper entitled "Scale of Ornaments in Architecture," by Mr. Joseph Hayes, sculptor, at 8 p.m.

Northern Architectural Association : Paper entitled "Small Country Houses of To-day," by Mr. L. Weaver, F.S.A. Hon. A.R.I.B.A., at 7.30 p.m.

Thursday, December 12.

Society of Architects : Paper entitled "Salisbury Cathedral," by Mr. E. W. Harvey Piper, at 8 p.m.

Leeds and Yorkshire Architectural Society : Brief Description of a Tour in Italy and exhibition of Drawings, by Mr. G. H. Forgett and Mr. Piet de Jong, at 6.50 p.m.

Sheffield Society of Architects : Paper entitled "Barnack Church, with Parallels from neighbouring Churches," by Mr. H. F. Traylen, A.R.I.B.A., at 7.30 p.m.

SCOTTISH ARCHITECTURE.

On the whole it would probably be correct to say that architecture in Scotland, of whatever period we like to select, does not differ from architecture in England more than local variations differ from each other, and that Scottish architecture should rather be regarded as a section of British architecture than a distinct development.

This does not preclude the existence of distinctive methods of treatment and evidence of originality and independence of thought. If we take as an example the work in Glasgow Cathedral we find an excellent specimen of Early English work which, in the hands of the same individual designer, might have come into being in Hampshire or the Isle of Wight, and a student of Early English work of the thirteenth century would not have been wrongly directed if he had been advised to make careful studies and measured drawings of the crypt of this Cathedral, which, in the words of Professor Simpson, "has no equal in England, probably none in Europe."

The four principal abbey churches of the Lowlands—Kelso, Jedburgh, Dryburgh, and Melrose—are also equally worthy of study and will not lead the student astray from the normal treatment of mediæval architecture in the British Isles, and, indeed, their ruined condition affords a better opportunity for the study of the inwardness of mediæval construction than does that of better preserved buildings.

It is true that in Melrose, the latest in date of these abbeys, there is some suggestion of French influence, as in the inclusion of chapels in the south aisle of the nave and in the tracery of some of the windows, but French influence in the fourteenth and fifteenth centuries is not confined to Scotland; it is repeatedly shown in English work, evident in the most unexpected places and without any apparent reason, at least as far as our knowledge of local circumstances in the past extends in the present day.

There can be no doubt, however, that a close intercourse between France and Scotland in the later mediæval and early Renaissance period was responsible for what it is the fashion to call Scottish Baronial Architecture. The circular tourelles, whether corbelled out or starting from the ground, undoubtedly had their prototype in the mediæval châteaux of France, and it is sometimes alleged that the corbie-step gables also had a Continental origin, but this theory we are not prepared to accept without a certain amount of reserve. The feature is at any rate a logical and easily worked method for the construction of the finished line of a gable, and it may well be that practical common sense dictated the use of the form in Scotland rather than a desire to imitate the work of Continental contemporaries.

We must not leave the consideration of the late mediæval period in Scotland without reference to the work at Roslyn with its parallelism to Portuguese work at Belem and Batalha, both interesting manifestations of what would probably have been the lines of development of Gothic architecture generally throughout Western Europe if it had not been overwhelmed by the flood of the Renaissance.

It is worthy of note that the early Renaissance detail of Scotland has a distinct individuality of its own. It cannot be said to have been adopted straight away from any Continental source, although it is true there is a certain amount of affinity between its results and those which are to be found in the Low Countries. This, however, we are inclined to attribute to the similarity arising from the individual working out of similar problems under similar conditions and similar influences by craftsmen working on parallel lines, rather than affected by any derivative connection. Thus, for example, Heriot's Hospital in Edinburgh, though possessing many ideas in common both with English Jacobean work and contemporary buildings in the Netherlands, has sufficient individuality to show that its designers were struggling through a period of transition from the same standpoint of Gothic tradition towards an as yet imperfectly understood ideal of Classic example.

The window head ornaments with their quasi blind tracery treatment on the principle of strap work both here and in the Regent Murray's house in the Canongate, show considerable fertility of design and an application of economy in building to the realisation of a pleasing effect at small cost. Not yet, however, has the sturdiness of the mediæval design given place to the refinement of the completely developed Renaissance.

When we come to a consideration of later work we find that the architects of Scotland more truly understood and were more completely imbued with the quality of refinement in Classic work, and we cannot forget that some of the best work of the Brothers Adam is to be found in the Assembly Rooms at Glasgow and in the College at Edinburgh. These cities also furnish us with some of our best British examples of the art of the Greek revival as exemplified in the Royal Institution and the High School at Edinburgh.

The thoroughness with which Scottish architects assimilated the best qualities of Classic design during the revival period seems to have influenced the work of their successors down to the present time, and there is in no part of Great Britain better architecture than that which has been produced during the last quarter of a century in the architects' offices of Glasgow and Edinburgh.

NOTES AND COMMENTS.

THE somewhat narrow line between legitimate and illegitimate commissions in the complicated system of modern commercial methods tends to the development of skilful evasion of the efforts of the Prevention of Corruption Act to put down secret commissions and bribery, and we are interested to know that the Secret Commission and Bribery Prevention League, Incorporated, now issues a "news-sheet," a special number of which has reached us containing counsel's opinion upon the legality or otherwise of various customs which occur in commercial transactions. Some of these concern architects. Thus we are told that counsel does not think that a builder employed as a tradesman to fix articles ordered direct by a customer from a manufacturing or other firm is an "agent" within the meaning of the Act, or, by receiving a commission from such manufacturing or other firm, is contravening any of its provisions.

In an address to the members of the Birmingham Architectural Association Mr. Raymond Unwin spoke of town planning from an architect's point of view. He gave several reasons why architects should take an interest in the town planning question. In the first place, he thought that it affected their buildings; in the second, it was really architectural work on a large scale; and in the third they, as a profession, stood specially for the addition of beauty to useful building. When it came to actually making a plan for the laying out of buildings the matter got beyond what either the engineer or the surveyor was trained to do. The function of the surveyor was to bring before the town planner the whole of the facts of the site as it existed, the whole of its conditions, and the whole of the requirements as to the future; and it was his business when the architect had made plans which, architecturally, satisfied those requirements, to criticise them from the useful point of view. The engineer was the structural and executive man; he must tell them the limitations within which they must work. But when it came to making the actual plan the problem became an architectural one, and it was then that the architect should claim his fair share of the work. Town planning consisted of two things. It was not only a plan, but a scheme. It fixed the width of streets and building lines, and the height of buildings in relation to streets. In some it was laid down that no houses should be of more than two storeys, and one partly, or wholly, in the roof. Here the interests of the architect were

concerned. Then, again, some schemes gave to the local authorities power to approve of the laying out of groups of streets. Here, too, the interests of the architect were concerned. A limit to a certain number of houses in a row had been suggested in some schemes, without regard to whether there should be a wish to build a group of houses or not at the same time. The area of the site which might be covered by buildings was limited, and if this point were not watched it might easily happen they could never have a street corner built up with any sense of closing in, and there would be great gaps even larger than those allowed under present by-laws.

From the annual report of the Royal Technical College, Glasgow, we learn that the instruction in architecture and building is appreciated by a large number of students, 640 having attended during 33,573 hours. The association of the Architecture and Building Department and certain others in the College with the Glasgow School of Art in the maintenance of the Glasgow School of Architecture continues to be successful, whilst the Architectural Craftsmen's Society has a membership of 121, who have listened to interesting and useful lectures on various subjects connected with architecture, including "The Application of Practical Geometry to Full-size Work in Scientific Stone-cutting and Masonry," "The Microscopical Examination of Architectural Materials," "The College Diploma and Certificate Courses in Building," and "Rothenburg on the Tauber."

Amongst the honours gained by architectural students of the school were the Soane Medallion and a certificate of honourable mention in the same competition, together with another certificate in that for the Pugin Studentship, whilst two of the students passed the final examination of the R.I.B.A., and two the intermediate examination.

The autumn number of *The Vista*, the quarterly magazine of the Glasgow School of Architecture Club, contains an interesting paper by the Rev. Professor Cooper on "The Fine and Applied Arts as Handmaids to the Church's Worship," in which many true lessons are inculcated as to the right use of the arts in church buildings.

A collection of articles from the pages of the *Croydon Guardian* by Mr. Lindlay Latham makes an interesting little book, with a record and instructive description of the special features of the various churches that it describes. We should like to see the example thus set

NOTE. DORMER WINDOWS.

followed by the local press throughout the country. Such articles as are here included should do a good work in interesting the general public in the historic monuments and ancient art of their particular neighbourhood, and thus tend to abolish the greatest enemy of architecture in this country—the ignorance and apathy of the Philistine.

PETROL AIR GAS.

SINCE the series of articles on Petrol Air Gas by Professor C. A. M. Smith appeared in the pages of *The Architect*, manufacturers of petrol-lighting plants have not been standing still, and we have from time to time called attention to new forms of apparatus, which have mostly pursued as their line of development the simplification of the working of the machine.

Petrol air gas has peculiar advantages of its own which are by now well recognised, and affect especially its position as a satisfactory method of lighting detached country houses which have to depend upon their own resources and cannot draw a supply of gas or electricity from some central station. It is essential, therefore, that any petrol lighting plant shall be of such simplicity that it does not require an individual of trained engineering skill to manage it, and the nearer any plant approaches to a fool-proof machine, capable of being worked by the ordinary maidservant, the better will be its chance of satisfying the requirements of a large number of householders.

Amongst the simply designed machines which have lately been placed upon the market is the Mitchelite, which in the normal type is actuated by water pressure, but can be arranged to be weight-driven. The plant consists of: (a) a gas drum fitted with a bell, which is connected with a vertical cylinder or pump; (b) a gas storage chamber whence the gas passes through the pipes to the burners; (c) a petrol supply tank connected by a tube with (d) the vaporiser or carburettor. The water supply automatically drives a patent pump, which forces down the gas drum and at the same time measures out the correct proportion of petrol, and, rising again, distributes it to the vaporiser, simultaneously drawing in a proportionate quantity of air to mix with it, thus forming

the gas vapour. By the fall of the gas drum this vapour is forced through the pipes into the gas holder.

In the vaporiser or carburettor the method adopted is that of allowing the petrol to trickle over a series of trays, thus becoming vaporised and mixing with the air.

It will be understood that when once the water supply is turned on the machine is automatic and requires no attention, the amount of supply of gas being always dependent on the consumption. The lights are remarkably steady and give warning when a further supply of petrol is required by a decrease of brilliancy, so that there is ample time for refilling the petrol tank before the light goes out entirely. The apparatus generally gives the impression of being a sound engineering job, and not a collection of tin cans.

SKETCHES IN ABERDOUR, FIFESHIRE.

ABOUT half an hour in the train from Edinburgh this little town is well worth a visit and full of interest to the architect. Like many other towns which possess a castle or some other large edifice of architectural merit, the inhabitants have been influenced in their building by it, and led to give their buildings little touches of detail which go far to make them of great architectural value and interest.

The castle, which first claims attention, consists of a keep of considerable antiquity. It is of rubble with dressed quoins and jambs, while the later Jacobean additions are of dressed stone, and the combination of the two styles is most pleasing. A garden terrace runs across the south front. Queen Mary's seat on a lawn below the terrace gives a touch of romance to the composition. The pigeon-house is said to be of the same date as the keep. Unfortunately the castle is now unoccupied and weather is playing sad havoc with the building, which is undoubtedly one of Scotland's finest architectural relics. The terrace, of which a small sketch is given, is a charming feature of the place. Below it is the bowling alley and archery ground, and at a still lower level is the old tilting ground. The ground falls away from the terrace towards the sea, and the pigeon-house is a pleasing feature in the foreground. The view from the castle across the Firth of Forth to Edinburgh is a magnificent one. The local guide-book describes the situation of the castle thus: "Still under the glamour of Scottish legend and romance, the visitor as he retraces his steps from the rocky promontory carpeted with soft verdure up to the limit of the hissing foam, is summoned to a historical reflection by a vision of

the Castle of Aberdour, overlooking the Dour and commanding a far-reaching view of the Forth and the fair lands beyond." From this the reader may judge that the site of the castle is no ordinary one. There are numerous interesting pieces of detail to this building, the window heads and sun-dial being especially noteworthy. It is unfortunate that the castle should have fallen into decay, but "evil happens that good may come," and its ruinous state led to the building of Aberdour House in the seventeenth century, which is a fine type of Scotch manor house. The old church which stands near the castle should also receive a visit. It dates back to the twelfth century. Still further east are the remains of an old barn where the country people were wont to bring in their tithes to the monks who would come over from Inchcolm.

Inchcolm is a small island about $1\frac{1}{2}$ miles from Aberdour, on which there are extensive monastic ruins. The island has seen troublous times, having been used as a state prison, lazaretto and garrison, but at present is undisturbed save by the tourist and archaeologist. A fresh-water well provides the water supply, and this well is, curiously enough, only a few yards from the sea. A stone over the door of the church bears the inscription,

"Stet domus haec donec fluctus formica marinos
Ebibat et totum testudo perambulet orbem."

May it prove true! There are many interesting little pieces of architecture to be seen in the town. The doors and chimneys are especially noteworthy. A pigeon-house is illustrated. These pigeon-houses are quite unique and form pleasing adjuncts to Scottish farmsteads. Donibristle House, open on Thursdays only, should also be visited. The garden is a fine one, and there is also some fine iron work in the gates presented by William III. to Lady Argyll. The House saw a horrible tragedy in the murder of Earl Moray. The latter incurred the displeasure of King James, as

"The bonnie Earl of Murray,
Oh! he was the queen's luvie."

The king engaged Huntly, a personal enemy of Moray's, to arrest him and the latter murdered Moray and burnt Donibristle. The house has been burnt in all three times. The present tenant of Aberdour House and the Castle courteously gave the writer much facility in inspecting the Castle. To one unaware of the charming individuality of

Scotch architecture, Aberdour is full of interest and should be certainly visited by anyone who wishes to study Scotch Domestic architecture. It was only the writer's privilege to spend a day there, but a week's stay would result in the filling of a sketch book full of most useful notes.

TEST DEFLECTIONS IN REINFORCED CONCRETE.*

THE above subject not only calls for the closer attention of engineers, but needs that closer attention without delay, before the proposed L.C.C. Regulations fix a standard of deflection which may or may not be correct, or even safe.

The Relation of Stiffness to Strength.—There is no need for the author to mention that the stiffness of a beam is no criterion of its strength, unless due regard be paid to the factors of depth and fibre stiffness; but it is not too easy always to appreciate that the fibres of a short deep girder, deflecting under load to say $\frac{1}{2}$ inch, are possibly being punished much more severely than those of a long shallow girder deflecting say 3 inches. Still more difficult is it to avoid the drawing of incorrect assumptions from the very minute deflections of reinforced concrete beams, because in their case not only are the formulæ for strength very tedious, but the writers of text books have failed to establish any connection between them and deflection, or even to show how deflection can be calculated.

Small Deflections in Reinforced Concrete not a Proof of Strength.—When beams of reinforced concrete are tested to say one and a-half times their working load, extremely small deflections are recorded, which are triumphantly quoted as evidence of the enormous strength of the new material, because a steel beam of the same proportions would have deflected very much more under its ordinary working load.

A point which is seldom mentioned, however, is that the deflections are small because the greatest working loads and stresses which we dare to place on reinforced concrete are so very much less than those which we habitually work to in wood or steel.

Reinforced Concrete Weaker than Steel or Fir.—A deflection of say $\frac{1}{2}$ inch in an ordinary wood or steel floor beam

* Abstract of a Paper by Mr. Percy J. Waldram, F.S.I., M.C.I., read on Monday, December 2, before the Society of Engineers (Incorporated).

B.S. 1910 - AD. 131

PIGEON HOUSE
ABERDOUR

ROOF OF PAN-TILES

GORDON SANBURN
AP. 11 1910

under a test load might indicate quite a satisfactory factor of safety. The same deflection in a reinforced concrete beam of the same proportions would mean that the structure was on the verge of total collapse.

Reinforced concrete has so many advantages over wood and steel in its great durability, its adaptability, and its simple and monolithic character that there should be no need for its exponents to claim for it the strength of steel or even that of ordinary fir. It is a much weaker material than either, and to pretend or believe otherwise is to court disaster. The safe load on a fir beam can always be trusted to destroy a reinforced concrete beam of the same size, unless the latter is heavily reinforced in compression.

It does not require much detailed investigation to appreciate that the fibre stress of 600 lb. per square inch, which is the limit of good concrete in compression in beams, obviously cannot produce deformations comparable with those which result from 11 or 12 cwt. per square inch on timber (quite a light loading) or $7\frac{1}{2}$ tons per square inch on steel.

Of course, concrete beams can be reinforced in compression, but the strength of the concrete surrounding the compressive reinforcement is still the governing factor, and double reinforcement is very uneconomical.

Reinforced concrete has the advantage of being easily formed with fixed ends, encased edges, and into ribbed floors in which the transverse slabs assist the main beams, and the strength of each part contributes to that of one strong monolithic whole; but even with those advantages the proportions of the parts have to be more generous than would be necessary with wood or steel, and the deflections under test loadings are necessarily far less than we have been accustomed to in those materials.

Deflections of Beams under a Given Stress.—It should be carefully remembered that we can obtain the deflection of a beam of given depth, span, and material under a given system of loading, without troubling about its moment of inertia or its section modulus, or even the amount of the load, provided that we know that the loading is stressing the fibres to a given amount.

Conversely, in all beams having the same proportion of depth to span, any given proportion of deflection to span under the same system of loading must indicate the same fibre stress in material of the same stiffness, whatever may be the size of the beam, the span, or the load.

Reinforced concrete therefore must always be expected to show deflections far less than those to which we are accustomed. Long before it deflects to anything like the extent that wood or steel does, it would be time for those conducting the test to look to their own safety.

The L.C.C. Draft Regulations.—The draft regulations of the London County Council specify certain degrees of deflection which would appear to need careful consideration. It

is necessary not to lose sight of the fact that these regulations require the approval of the Local Government Board before they can come into force; and that until they are so approved it is the obvious duty of professional men to endeavour by all available means to bring them to a high state of efficiency. Their scope may be nominally limited to special buildings in London alone, but when once adopted they will most certainly be regarded as a standard, and their conditions will be specified in cases where they have no legal status whatever.

The Act of 1909 which authorises their compilation requires the Council, before applying for their approval by the Local Government Board, to give notice to the Surveyors' Institution, the Institution of Civil Engineers, the Royal Institute of British Architects, and the Concrete Institute. Every member of any of these Institutes can therefore approach his Council or the Local Government Board direct, if it should appear to him to be desirable that any of the 160 clauses should be altered.

The Regulations in their present form appear to have been carefully compiled from codes already in existence in Europe and America, where reinforced concrete is far more extensively used than in England. At least one of these codes—that of the French Government—was based upon six years of valuable and exhaustive experimental research. It would therefore scarcely be expected that any serious errors of principle would have been generally adopted, and clauses upon which the foreign codes are unanimous, or are in general agreement, ought apparently to be good enough to adopt.

But precisely the same considerations obtained when other codes were drawn up. The natural desire of the codifying authority to be able to show precedents for its Regulations is only too favourable to the perpetuation of errors, which acquire fresh status every time they appear. It would therefore certainly seem to be desirable that the Institutions should do all they can to awaken interest in these Regulations and secure the greatest possible volume of criticism from their members; so that even if errors of principle may have crept into other codes, they shall not be repeated in the first British code.

Early in the present year the author was consulted with reference to a case where the parties had agreed that the Regulations as printed in the Council's Minutes should be worked to. This opportunity of applying them to the problems of a somewhat complicated design necessitated a close examination of their provisions, and the result was, to say the least, disquieting.

For instance, the clauses determining the strength of columns—based like the French Code and the R.I.B.A. Report, on a mis-applied reading of Euler's formula—were unworkable; whilst those relating to deflection would appear to be positively dangerous.

CHIMNEY AT ABERDUR
CASTLE

GORDON SANDERSON

"QUEEN MARY'S SEAT"
ABERDUR CASTLE

G. SANDERSON.
AP. 23. 1910.

Clause 23 allowed beams of a lesser depth than $\frac{1}{2}$ span, provided the calculated deflection was less than $\frac{1}{800}$ span—regardless of the fact that even with absolutely free ends the concrete of a beam $\frac{1}{2}$ of the span in depth deflecting $\frac{1}{800}$ l would be stressed to nearly 700 lb. per square inch, whilst in beams with fixed ends it meant anything up to 3330 lb. per square inch. As the clause did not specify whether test or working load was to be calculated for it might have been merely harmlessly unworkable, especially as there was no method specified for calculating the deflection of T and double reinforced beams.

But Clause 143 specified the test by means of which the District Surveyor should determine whether or not suspected work should be condemned as being a deflection of $\frac{1}{800}$ of the span under the full working load. A short deep beam with fixed ends or a thick square slab with four fixed edges was thus to show precisely the same degree of flexibility as a long shallow beam with absolutely free ends.

Of course this was no test at all. No beam or floor of ordinary proportions could ever show such a degree of deflection, it would simply cease to exist. A beam of only $\frac{1}{2}$ of its span in depth, even with absolutely free ends, whatever its section, is necessarily being deformed when the deflection reaches $\frac{1}{800}$ of the span, to an extent which can only be consistent with a stress of 1,066 lb. per square inch on the concrete.

No amount of compressive reinforcement can make any difference, because when that degree of deflection is reached the concrete surrounding the compression rods is receiving a stress under which it is liable to spall off and leave the rods denuded and free to buckle. If the beam were deeper or if the ends were fixed, as they are in the great majority of cases, the specified degree of deflection would be still more impossible.

But no beam, however bad or shaky, could be condemned under the clause so long as it showed under test load any less deflection. The clause not only gave an implied official approval of a test deflection which would be highly dangerous to everybody concerned, but it would have effectually defeated its own object by preventing the condemnation of

any beam or floor which could just stand its calculated load without any factor of safety.

These and other points were submitted to the Council of the Surveyors' Institution, who promptly met and considered them, and made representations which at the time of writing are presumably still under consideration.

Suggested Standard of Deflection under Test Load.—The author's suggestion made with regard to deflection was that the standard should be $\frac{1}{800}$ l on a beam $\frac{1}{2}$ of the span in depth under the calculated load, with free ends and distributed loading; the effect of any conditions other than these being duly allowed for in each case. This would apparently have been equivalent to about 480 lb. per square inch on the concrete. Of course, any test which increases only the superimposed load varies in severity, being lenient on heavy beams and severe on light ones; a 25 per cent. increase on the total calculated load may or may not be equivalent to a 50 per cent. increase on the superimposed load, but it is estimated to do so in the average case.

Effect of Ordinary End Fixing not yet fully Determined.—It would obviously be better to have a standard criterion of deflection applicable direct to the fixed ends customary in reinforced concrete beams. But whereas we can predetermine the deflection of reinforced concrete beams with free ends and compare it with actual tests, experimental data are lacking as to the actual effect of the ordinary methods of fixing the ends of such beams; which are, it must be remembered, almost invariably doubly reinforced at the ends to meet the reverse bending moments over the supports, and are therefore of unequal stiffness. The theoretical effect of complete end fixing in a beam of uniform section is to reduce the deflection to $\frac{1}{2}$; but to stipulate for a deflection of $\frac{1}{800}$ l with fixed ends might be right or it might be wrong. We do not know.

Experiments to determine the point would not be very expensive or difficult, and there is power under the parent Act for the London County Council to make them. But until the point is determined, at least approximately, it is obviously impossible to legislate on a basis about which we know practically nothing.

G.S. AD. 23. 10.

Importance of a Correct Standard.—If the standard of stiffness be fixed too high good work will be unjustly condemned; if it is too low, bad and dangerous work will receive an undeserved certificate of strength. The minute range of the deflections makes it all the more necessary to fix the standard with the greatest care.

The Calculation of Deflection under given Loading where the Stress Involved is Unknown.—The thankless field of active legislation can now be left for the less exciting but far more interesting study of engineering problems.

The fact that reinforced concrete has been smothered with a mass of intricate formulæ scarcely makes it inviting to the general practitioner. If we had to calculate the moment of inertia every time we used a rolled section we should leave mild steel to experts and go on building in masonry, cast iron, and wood. The formulæ for reinforced concrete continually reiterate properties which might just as well be obtained from tables or diagrams; we therefore leave the subject to experts, and stick to mild steel and the Tables of Properties of British Standard sections. The British engineer requires to be personally assured of the accuracy of his calculations—and when the R.I.B.A. Report tells him that the moment of resistance of a T beam is:—

$$cbd_d \cdot \frac{S^3 + 4 mrs^2 - 12 mrs + 12 mr}{6(S^2 + 2mr)}$$

he prefers to use a rolled joist.

As a matter of fact about half the terms in that formula are unnecessary, and the other half can be tabulated and plotted on diagrams; so that the designer picks out a T section from his diagrams just as easily as he can pick out a rolled joist.

Only when the subject of reinforced concrete is thus dug out of the overlying strata of mathematical symbols is it possible for the average engineer with limited time and less leisure to investigate its principles. Let us endeavour to excavate the subject of deflection.

The actual and exact measurement of the strains produced by carefully measured stresses is an operation full of interest and instruction to the engineer, and when the theoretical and actual deflections are plotted side by side their comparison is especially useful.

In beams of wood and steel it is a comparatively simple matter to predetermine and plot the deflection due to any given loading; but in reinforced concrete beams the unnecessary complexity of the standard calculations for strength has apparently scared investigators from attempting to deduce the moment of inertia of a section. As a matter of fact, when calculating the strength, all the necessary calculations to determine the moment of inertia are made, and when this is obtained the ordinary formula $\Delta = \frac{x W^n}{EI}$ can be applied

with the same facility with which it is used to ascertain the deflections of wood and steel beams.

In this standard formula, x is a constant varying with the type of beam and the method of loading, W is the total load in lb., l is the span in inches, E is the modulus of elasticity of the material in lb. per square inch, and I is the moment of inertia of the section in inch units.

Deduction of Moment of Inertia from Moment of Resistance.—The difficulty of applying this standard formula to reinforced concrete beams has been that the formulæ for moment of resistance do not use the moment of inertia. But the moment of inertia is simply the section modulus multiplied by the distance y of the neutral axis from the layer of fibres with regard to which the section modulus has been calculated.

The section modulus for the outside skin of concrete is expressed by the formula which determines the moment of resistance of the section with regard to the concrete, with the term c denoting the stress on the concrete omitted. Similarly the section modulus for the tensile reinforcement is merely the formula which determines the moment of resistance of the section with regard to the steel, with the term t denoting the tensile stress omitted.

We can therefore obtain the moment of inertia either from the R_c or the R_t formula by omitting c or t and multiplying by the distance of the neutral axis from the fibres under consideration. This will be the well known dimension n in the one case and $d-n$ in the other.

Reference was then made to the calculations necessary to determine the strength of reinforced concrete beams, and a number of formulæ were given, with explanatory notes. The application of these to well-known tests was shown by a series of eight diagrams, and particular attention was directed to one in which the conditions were such as were generally supposed to make the calculations almost impossible, on account of their intricacy. By the author's method, however, the problem was shown to be very much facilitated.

In conclusion, the author said he trusted that in necessarily drawing attention to the want of intrinsic strength of individual members of reinforced concrete structures he will not be considered to be disparaging a material which for many purposes is the finest we have. No material can attain its full growth in an atmosphere of foggy mystery. Until engineers as a body can appreciate its principles and know its weak points as well as its advantages it will not be used with the confidence which it deserves.

THE Bishop of London, in a recent address, said:—“Because the streets are dull and monotonous, vulgar and glaring, we want nothing but the very best church in the East End.”

LONDON COUNTY COUNCIL AND PREVENTION OF FIRE RISK.

FOLLOWING upon the recent disastrous fire at the premises of Messrs. John Barker, Ltd., important questions were asked at this week's meeting of the London County Council, involving the steps taken by the Council under the Building Acts (Amendment) Act, 1905, to secure proper equipment of buildings in London against fire risks and the provision of adequate means of escape.

Mr. C. Jesson asked the Chairman of the Building Acts Committee whether his attention had been drawn to the letter in the *Times* over the signature of Mr. Edwin O. Sachs, making the serious and startling allegation that only 527 buildings had been put in order out of approximately 50,000 to which the Act applied, and who was responsible for producing the Council's plans of buildings as required by Section 7 of the Act?

In view of the jury's verdict at the inquest in connection with Messrs. Barker's fire, Mr. Jesson further asked what steps would be taken to secure that all such buildings should be brought up to the standard required by the Act; how many such buildings were not up to that standard, how many were receiving attention, and how many could be considered satisfactorily equipped by the provision of suitable means of escape?

Mr. Andrew Taylor (Chairman of the Committee) replied that the figure of 527 represented the number of twenty-person buildings coming under Section 9 only, in which the means of escape had been put in order. It took no cognisance of other sections, under which a great deal of work was being done. The figure of 50,000 quoted by Mr. Sachs was a pure guess. The total number of buildings which had been put right, to which the 1905 Act applied, was 8,299, and since January 1906 1,161 factories had also been completed as regards means of escape. The owner of new buildings was responsible for submitting drawings under Section 7 of the Act, and under no other section could plans be demanded. Reasonable steps were being taken to obtain satisfactory means of escape, and preference was given to those cases where it was known that employees slept on the premises. It was not known how many buildings were not up to the Council's standard in the matter of means of escape, and it was impossible to separate those in which assistants lived in from those in which they did not. Every little house with more than two families living in it came under Sections 10 and 12,

and there were many thousands of such houses all over London, but it would be a serious hardship to compel the owners to go to much expense. The Act had to be administered with discretion, and the Committee were doing that to the best of their ability.

Replying to a further question by Mr. Jesson, Mr. Taylor said the total number of buildings which had been inspected under the 1905 Act and the Factories Act was 12,543. It was impossible to say how long it would take to make an inspection of all buildings coming under the Act, because statistics were not available of the number of buildings to be inspected.

Mr. Jesson further asked the Chairman of the Establishment Committee how many assistants the Architect of the Council had to aid him in carrying out the Council's duties under the London Building Act, 1905, and whether it was not possible to increase the staff by engaging, if necessary, temporary assistants to expedite the working of the Act.

Mr. Isidore Salmon (Chairman of the Committee) replied that the number of the staff was seventy-three, but the question of augmenting the staff was a matter for the Building Act Committee.

COMPETITION NEWS.

GOVAN.—The plans submitted by Mr. Andrew Balfour, F.R.I.B.A., Glasgow, have been selected in the limited competition for a school proposed to be erected at Govanhill by the Govan Parish School Board. Accommodation is provided for 1,200 scholars, and the cost is estimated at £18 000.

HARROGATE.—The Competitions Committee of the Royal Institute of British Architects have been in correspondence with the promoters of the Harrogate School Competition. As a result of the correspondence, the conditions have been amended and are now regarded as satisfactory.

THE Devonport Borough Council have been recommended by a committee to make preliminary arrangements for inviting plans and designs by competition for a new Guildhall and municipal offices at a cost not exceeding £70 000. A site near the Technical Schools has been acquired for the purpose.

ILLUSTRATIONS.

ST. ANNE'S CHURCH, CORSTORPHINE, EDINBURGH.— TYMPANUM.

THE new church which is being built at St. John's Road, Corstorphine, will be enriched with a sculptured tympanum surrounded by a carved archivolt. The architrave round the door will be carved with the signs of the Zodiac, symbolising the twelve months of the year with, over the centre of the lintel, the Agnus Dei—"Christ Crowning the Year." Over the entablature of the pillars, which stand one on each side of the door, will be figures of Praise and Prayer looking towards the tympanum. The tympanum, which is 5 feet in diameter, represents "Christ in Glory," seated upon the rainbow throne with an orb in His left hand, and the other raised to bless. Behind Him is an architectural canopy with His symbols, alpha and omega, on the capitals of the pillars. Round about Him are the Four Evangelists in appropriate attitudes, surrounded by a fringe of cloud, and accompanied by their symbols. Beneath the feet of Christ are the sun and moon, while over the background are scattered the seven stars of the morning. On the surrounding archivolt are seven angels with seven lamps or candlesticks in their hands.

The photograph by Messrs. Annan is from the model by Mr. James C. Young, who has ably carried out the ideas of Mr. P. Macgregor Chalmers, the architect of the church.

DESIGN FOR POSSIL PARK LIBRARY.

THE drawing by Mr. Bertram Lisle, which we reproduce, was exhibited this year in the Architectural Room of the Royal Academy.

SKETCHES FROM CAMBRIDGE.

THE drawings of gateways from Clare College and St. Catherine's College were made by Mr. E. H. Gibson during his tour as holder of *The Architect* Travelling Studentship for this year.

MODERN METHODS OF INDIRECT LIGHTING.*

THE artificial production of light is perhaps the most inefficient and wasteful process to be found in any branch of engineering or science. Without attempting to discuss the reasons why this should be so, it may be said that this very fact is the strongest possible argument for the necessity for "efficient" lighting—i.e., for using such arrangements of artificial light sources as will most economically meet the demand for properly distributed light. Efficiency of lighting is here to be used in the wider sense of visual efficiency, and not in the narrow sense of simply physical returns for energy expended (i.e., lumens or foot-candles per watt of electricity or 1,000 ft. of gas). Systems of illumination cannot always be rated in terms of energy efficiency. In the case of lighting the term "efficiency" must be used in a broader sense of general visual efficiency, by which is meant the effectiveness of the illumination secured in enabling us to see things easily and in comfort.

Mr. Bassett Jones, in a recent paper on interior illumination before the American Institute of Electrical Engineers, says: "The work to be done by many lighting arrangements is not only to be able to see and work with ease and comfort, but also to make the interior pleasant to the senses, and make its beauty visible."

"It does not follow because the light used in setting forth a design of a library is not directly concerned with the actual business of the room that therefore the lighting equipment is inefficient. In fact, only a small portion of the generated flux need be used for reading, and still the system be highly efficient, since it makes the room effective and pleasant to see and to be in, whether one reads or not. It is quite useless to have beautiful things unless one can see them, and that illumination which properly sets them off in true value as to perspective, shadow, and colour is correctly designed, no matter how much energy is necessarily and purposefully used in obtaining the correct results."

"The frescoes of St. Peter's (or nearer home the dome and architectural beauties of St. Paul's and Westminster Abbey) are wasted unless they can be seen, and for this purpose the 'working plane' of illumination is on the ceiling, and not near the floor."

In approaching the subject of our discussion, not only is it necessary to have the foregoing considerations in mind, but also to remember that light and illumination cannot be measured in physical terms alone, but involve physiological and psychological facts and considerations as well.

More stress should be laid on the necessity for natural, rational, and comfortable illumination. Some systems of lighting in vogue are not only ineffective and inefficient, but positively annoying, owing to the exposure of glaring sources of light, which effectually defeat their real purpose.

Faults of this character are well stated in the following remarks of James Knox Taylor, Supervising Architect of the United States Navy:—

"For years architects have been devoting their time and talent to the designing of interiors, combining all the beauty of design possible with utility for their particular requirements. After painstaking effort, disappointment frequently results when on fixtures hung in the centre or around the sides of such interiors direct lighting units are mistakenly placed. Lumps of light—irritating, blinding sources, that lower the ceiling, shorten the room, destroy the lines, and ruin the effect the architect has striven for."

Faults and deficiencies of lighting have in the past been very largely due to a lack of suitable lighting appliances. It has only been in recent years that apparatus for producing satisfactory and effective illumination has been available. While the introduction of tungsten lamps, with their great increase in efficiency, has given a great stimulus to artificial lighting, yet it should be noted that as much, and even more, depends upon the efficient use of such lamps or light sources. The gains in efficiency of the sources can be further multiplied through the use of effective distributing appliances and the judicious arrangement of the lamps.

The whole subject of illumination and illuminating engineering is of quite recent date, but is now developing in a most rapid manner. Indirect illumination, which was scarcely known a few years ago, has already come into very general use.

INDIRECT ILLUMINATION.

The idea of indirect illumination is not exactly new. We have had indirect lighting installations in years past, the most well-known application being the "cove-lighting." According to this method lamps secreted in a groove or cove on the side walls just below the ceiling level, so that the reflected light is thrown out on the ceiling, and thus indirectly reflected on to the floor or objects. The limitations of such a system (which could frequently not be employed without structural changes in the building) and its comparative inefficiency gave rather a bad name to indirect lighting. This is responsible in a large measure for the very general impression that the indirect method of lighting is necessarily expensive and prodigal of current. The success of indirect lighting awaited the development of new and improved appliances. This result was secured by the introduction of the system known in America as "eye-comfort," and in England as the "eye-rest" system of illumination. This system of indirect lighting employs a fixture in the form of an inverted bowl suspended from the ceiling of the room. These bowls contain highly efficient and powerful reflectors of special mirror-glass construction. They are scientifically designed to give the most effective distribution of light for indirect lighting methods.

The reflectors used are known as "X-Ray," and consist of blown-glass blanks of correct form, which are in one piece and fire-glazed. These blanks are backed with pure silver put on by a special process, and this in turn is covered with an elastic enamel to protect and preserve it. The blanks are given a number of flutes and corrugations in order to prevent striations. These reflectors, as may be expected, are very efficient. Of 734 lumens generated by one experimental lamp, 612 are yielded from the reflector, which equals an efficiency of over 83 per cent.—a much higher efficiency than is given by any other reflector with which the authors are conversant, although we make a point of testing all we can obtain.

It will be appreciated from the foregoing description that the reflectors are opaque, so that opaque containers are also used. The latter usually take the form of bowls, which may be of metal, wood, glass, earthenware, plaster, &c.; so that, not only is there the possibility of an enormous number of different designs, but also a large selection of material from which to execute them. This makes it possible, not only to supply these fittings to suit almost any style of building, but permits of their forming part of the actual interior decoration. This form of lighting probably offers more scope in this direction than any other.

It should be noted that indirect lighting must be done in a really scientific manner to be successful, and herein lies the secret of the success of this particular system.

The success of modern indirect lighting has been remarkable, in that it was a purely practical and empirical development put forward in almost direct opposition to previous theories, and combated by many as impracticable.

In the attempt to get away from bare lights and excess brilliancy, the natural step was to increase the light-giving area. This was generally done by the use of diffusing globes over the lamps. The indirect system went a step further, and increased the light-giving area by using the largest available surface in the room—that of the ceiling. This was, however, somewhat too radical for the ideas of many experts, who could not agree to such a solution of the problem.

Yet the first development, applied in a small way, steadily grew, and its popularity forced many to reconsider their theories on this subject, and to study the causes which have contributed to this success.

VARIOUS SYSTEMS OF ARTIFICIAL LIGHTING.

The various systems of artificial lighting in effect to-day can be discussed under four headings.

(a) *Direct Lighting* comprises systems in which the greater part of the illumination is received directly from the light units or sets of lamps and reflectors.

(b) *Direct Lighting*, in which the greater part of the illumination is received directly from a light source enclosed in diffusing globes, as, for example, Holophane spheres, Holophane bowls, and Alba spheres.

(c) *Semi-Indirect Lighting*, in which the light is partly transmitted directly from the lighting units through a diffusing medium, and partly indirectly by reflection from the ceiling or other surface.

(d) *Indirect Lighting*, in which no light is received directly on the illuminating plane, but only indirectly through reflectors from a second surface or body. In the form of indirect lighting considered under this heading the light is directed away from the objects to be illuminated and

* Abstract of a Paper by Mr. F. W. Willcox and Mr. H. C. Wheat. Presented at a meeting of the Illuminating Engineering Society, held at the House of the Royal Society of Arts, 18 John Street, Adelphi, on Tuesday, December 3.

thrown upon the ceiling, from which it is reflected upon the working plane.

Class A.—Direct lighting with reflectors is, as is well known, by far the most generally used form of lighting.

Class B.—Direct lighting from diffusing globes or bowls comes next; the indirect and semi-indirect methods being more recent, have not come into such extensive vogue as Class A and B, but are making very rapid progress.

The author then made a rapid comparison of the merits of each system of lighting.

INDIRECT LIGHTING.

1. *Economy.*—While on the score of pure physical efficiency in lumens per watt, this system may stand below the others, yet in point of general visual efficiency its general results are comparable, and in many cases superior to the other systems. Even the physical efficiency of indirect lighting systems is often considerably ahead of that of installations which it replaces, so that the adoption of the indirect lighting system in numbers of cases actually reduces the energy consumed. We might here summarise the results of a test by Mr. J. R. Cravath on the lighting of a small room (*Transactions of the Illuminating Engineering Society, U.S.A., 1911*). Mr. Cravath made a practical test of the lighting in seven different forms. The results of the test gave the following relative efficiencies in lumens effective per lumens generated:—

	Per cent.
Direct lighting with prismatic reflectors on ceiling	52
Bare lamp at ceiling	40.9
Direct diffused lighting with 8-in. opal bowl at ceiling	33.7
Semi-indirect with inverted opal reflector	37.6
Indirect lighting ("eye-rest" system)	29.5

The results of this test applied in the form of curves showing variations at different points in the room from minimum to maximum are very interesting, and indicate the following facts:—

The differences in minimum illumination were very slight, and therefore approximately the same wattage was secured for any of the methods employed. Assuming that with general illumination the amount of power required must be determined by the minimum illumination, then the differences in efficiency above noted do not indicate similar differences in the cost of lighting the room. The higher efficiencies simply indicate a surplus of illumination in those parts of the room most strongly illuminated, and therefore this surplus can be regarded as a disadvantage rather than an advantage. On this basis—i.e., the greatest degree of uniform illumination with the minimum value as the determinant—the experiments do not indicate a more expensive scheme of lighting with indirect or semi-indirect systems than with other systems of lighting—i.e., for the same minimum illumination. The least efficient system on the pure physical basis of average lumens per watt is about as good as the most efficient, and considering the question of glare and comfortableness of lighting there appear to be material advantages in favour of the indirect system.

Efficiencies of indirect lighting can be much higher than the foregoing result shows, extending over 50 per cent. in favourable cases. As the efficiency of the "X-Ray" mirror reflectors employed in the indirect lighting equipment is 80 per cent., and the efficiency of the average calcimined ceilings (rough and smooth) is over 76 per cent., the total efficiency of reflection would appear to be above 60 per cent. with this system.

2. *Glare.*—Glare is undoubtedly reduced to the minimum by the indirect system of lighting. The lamps themselves are entirely hidden, and the greatest surface brightness, that on the ceiling, is very much lower than with any other form of lighting. The very large surface of the ceiling acts as a virtual source of lighting, giving almost perfect diffusion with an entire absence of the uncomfortable effects associated with glare.

3. *Shadow Effect.*—On this point the indirect lighting system stands pre-eminent. Shadows are less dense, and the edges softer. It would be a mistake, however, to assume that this lighting is shadowless, as this would make it objectionable. It casts shadows of a character which avoid their disadvantages, and secure the advantages by preventing any flat effect that may occur under other systems of indirect lighting such as cove-lighting.

It may be stated here that in comparison of shadows one must consider the contrast between the illumination in the shadow and the surrounding illumination. This is the reason why the shadows with indirect illumination appear so much less than with direct illumination, but it should be remembered that this system of lighting is not shadowless.

4. *Evenness of Illumination.*—The indirect system of lighting surpasses all other systems in this important point, and properly installed gives the best results from the fewest number of points. It is one of its important advantages that it requires much fewer outlets than the direct system. The difference is that with the indirect system of illumination we treat the illumination of a room as a whole, while with direct lighting we may have to treat it in parts or sections.

5. *Comfort and Agreeableness of Lighting.*—On this point it may be contended that the best results of all are obtained by indirect system. A restful and beautifully diffused illumination is obtained, the conditions resembling those when daylight enters a room through a skylight or obscured glass roof. With proper tinting of the walls the light can be toned to give rich, warm, attractive effects. Severe contrasts, glare, and heavy shadows are eliminated, with the result that the architectural features of the room appear to the best advantage.

It is perhaps the quality of "naturalness" which makes the illuminating effects of the indirect system so comfortable and agreeable. Now it is the characteristic of good lighting to be unobtrusive, just as a healthy organ of the human body operates unconsciously, and does not distract the attention of its owner. This is characteristic of daylight and all natural effects, in which we move and act without being conscious of their presence.

In the test by Mr. Cravath on the lighting of a small room referred to, it was found that the relative comfort of the various systems stood in the following order: indirect first, then semi-indirect, and then the diffused direct light with the opal bowl.

As has been well said by Ferree, "the problem in modern lighting is not so much how to see better as how to see with more comfort, and with less damage to the general health from eye-strain."

OBJECTIONS TO INDIRECT LIGHTING.

Inverted or indirect lighting is frequently subject to adverse comment on different points, and we will consider these in detail.

Brightness of Ceiling.—It is sometimes claimed that the surface brightness of the ceiling is excessive and uncomfortable, but tests made do not confirm this claim. Tests made by Mr. Rolph show that average white calcimine ceilings, both rough and smooth surface, gave a reflection co-efficient of over 76 per cent., and this value was obtained quite uniformly from any point on the ceiling—i.e., for any angle of incidence of the reflected light from the inverted fitting. This serves to show the large area of distribution of brightness on the ceiling, and the consequent low intrinsic brilliancy.

Surface Brightness of Various Light Sources and Materials used in Artificial Illumination.

Material.	A Candle-Power per Sq. In.	B Foot Candles.	C B/A.
Frosted Mazda Lamp	10.8	2,100	185
Holophane Stiletto Reflector (brightest part)	4.75	1,150	244
Holophane Bowls	2.38	480	202
Veluria Reflector	1.83	320	175
Alba	1.81	280	155
Opalax	1.40	240	172
Alba Dish9	192	214
Ceiling above Concentrator12*	23	192*
Ceiling above Diffuser065*	12.5	192*

* These figures calculated only.

A number of tests made on this point at Rugby yielded the results given in the accompanying table. All the tests were made with ordinary 60-watt Mazda lamps maintained at constant voltage. Two different sets of observations were carried out, one with a photometer and one with an illuminometer. Both these are given on the table, the first column giving values of candle-power per square inch (obtained with the photometer) taken at a distance of 10 ft. from a luminous source, and the second column giving foot-candles read on the illuminometer at a distance of 18 ft. from the source. The third column gives the ratio of the first and second. It will be noted that the last figures of the table represent two different results for ceiling brightness above an inverted fitting. These two results represent the maximum value obtained with two different reflectors giving respectively a concentrating and diffusing distribution of light.

This table shows the very low degree of brilliancy and intrinsic brightness of the ceiling, and should effectually answer all criticism on this point.

The intrinsic brilliancy (in candle-power per square inch of ceiling) with indirect lighting is probably not over one one-hundredth of the brilliancy with many direct lighting systems.

Brightness of Walls.—On this point we might say that there need be no such condition, since the walls can be tinted to any degree of subdued shade desirable. It is hard to understand, however, how the brightness of the walls can be made any objection, in view of the fact that in ordinary daylight effects a large part of the illumination comes in through the windows, and is reflected from the side walls. Where the personal taste of the occupant permits brightness of the walls we have here evidence of considerable horizontal component from indirect lighting, which has considerable value in the lighting of pictures on the walls and the faces of the people in the room. There is no system of lighting that equals indirect lighting for bringing out the pictures on the wall, and it is the invariable comment of the people, seeing this system, that the "pictures look beautiful," and that people can be more easily recognised at a distance in the interiors of large buildings.

This horizontal component of indirect lighting is a valuable factor in the illumination of vertical surfaces, and far from being a disadvantage, is one of the advantages of indirect lighting, which is apt to be overlooked in estimating the value of the illumination solely by the amount of foot-candles given in the horizontal plane.

(To be concluded.)

FRENCH RENAISSANCE ARCHITECTURE.—VIII.

In the eighth lecture of the course now nearing completion at University College, Gower Street, W.C., Mr. W. H. Ward, M.A., A.R.I.B.A., treated of "The Style of Louis XV. The Palladian-Rococo Compromise."

In his opening remarks Mr. Ward pointed out that the first half of the eighteenth century, which included the last fifteen years of Louis Quatorze and the first thirty-five of Louis Quinze, is marked in architecture by an apparently anomalous state of affairs. On the one hand, the tradition of the Grand Manner maintained its sway almost unabated as regards exteriors, while its decoration assumed a character of "sans-gêne" totally at variance with academic canons and ponderous stateliness. Yet the two divergent tendencies are combined into something like harmony, which Mr. Ward called the Palladian-Rococo compromise.

The explanation of the seeming contradiction lies, as usual, in the life and thought of the times, as well as in artistic considerations. The Grand Manner in architecture fitly expressed the pomp and grandeur of the French monarchy at its climax, and its stately tradition persisted amid contrary fashions just as the State ceremonial continued unabated, in spite of declining fortune. The principal means towards its persistence were twofold—first, the influence of the Royal Academy of Architecture, with its teaching based on the sixteenth-century writers on ancient architecture and design, and, secondly, the chief posts in the Royal buildings department remained to a large extent in the hands of architectural families, many of whom belonged to the Academy, and who had a long professional tradition behind them.

With the last years of the Grand Monarque its glamour faded, and there came a reaction when, after reigning seventy-two years, Louis XIV. passed away in 1715. The gaiety of the earlier part of his years had been superseded by empty pomp and later by hard bigotry. The new desire for ease felt by society is expressed by the refinements in planning of their luxurious private houses, and by the sprightly unrestraint of their decorative code. It was the age of "salons," where good manners, good taste, refined amusement, and brilliant conversation formed the only business of life.

It is, therefore, in the private house, and especially in the salon and its decoration, said Mr. Ward, that we find the most characteristic expression of the age. There had been a relative halt in the building of private houses during the time when the spell of Versailles was supreme. But from 1690 onwards Paris and its neighbourhood began to be covered with both great mansions and fashionable small houses. Modification in internal arrangements had already begun to appear in the early part of Louis XIV.'s reign. The tendency towards lightness and brightness was developed until by the first quarter of the eighteenth century there arose a type of decoration transitional between that of Louis XIV. and Louis XV., which is known under the name of Regence. With all its flowing and fluttering ornament, design still had a firm fixed basis of straight lines and a structural framework of dados, cornices, and orders.

This characteristic, however, disappeared in the fully-developed Louis XV. style, which has for its main charac-

teristics an almost complete elimination of orders, of right angles, of heavy mouldings, and other members casting shadows. A love for free flowing lines and naturalistic vegetation came to the fore. However much one may deplore the immorality of contemporary life, one must at least admit, said Mr. Ward, that this Rococo style was completely appropriate to the artificial manners of the time. In France, where it is almost wholly confined to decoration, there are certain types of ornament and subject which constantly accompany it. The first of these is the Rocaille, which is more or less based on the forms of shells, and have their crinkled or fluted surface and the scalloped and laminated edges. A second type of ornament is the palm tree. In the Royal palaces of Louis XV. the Rococo never goes to inordinate lengths, but in private houses full rein was given to every caprice and to indulgence in the fullest informality. A complete example of this manner is to be found in the Hôtel de Soubise in Paris, now the National Archives.

The general scheme of colour employed was usually in light tones, various shades of white with pale olive or citron, straw or rose colour, and the ornamental portions artfully gilded in different tones of gold. The smaller panels over doors and chimneypieces were filled with pictures, the tall ones with mirrors (obtainable by this time in larger sheets), or, like the ceilings, with one of the many types of arabesques.

No single entire building seems ever to have been erected in the Rococo manner. The only portions of elevations which are affected by it are, as a rule, the few decorated features. In some cases, particularly in the provinces, or in "bourgeois" houses, where taste was less fastidious, they are sometimes rather profuse. But in the case of the best work of the period, among which are a number of aristocratic mansions in Paris, this is not the case. Two examples of the latter are the Hôtel de Matignon in the Rue de Grenelle (now the Austro-Hungarian Embassy) and the Hôtel de Moras or Beron in the Rue de Varenne.

The first part of the reign of Louis XV. was not fruitful in palatial architecture. His Government, however, though generally sluggish and incompetent, carried out an important, if fitful, policy of public works in the great cities of France, as at Bordeaux, Lyons, Dijon, Nantes, and Rennes. At Nancy a scheme of town planning was carried through which is remarkable for the completeness of its artistic treatment and for its preservation to the present day.

With this splendid example of the potentialities of the Rococo-Palladian compromise, with its traditions of the Grand Style inherited from the seventeenth century, Mr. Ward closed his survey of the style of Louis XV.

VICTORIA AND ALBERT MUSEUM.

IMPORTANT acquisitions have recently been made in the Department of Woodwork in the Victoria and Albert Museum, South Kensington, W.

Three of these acquisitions are additions to the collection of mediæval woodwork. The earliest is a French casket of the fourteenth century, which is stated to come from the Church of the Holy Trinity at Eu in Normandy. This casket was presented to the Museum by Mr. Murray Marks; it is of oak, gilt, and elaborately carved with Gothic tracery, the mounts being of gilt copper, and the interior painted with the Coronation of the Virgin and the symbols of the four Evangelists (exhibited in Room 51). A pair of oak cupboard-doors from Northamptonshire, painted with scenes representing the orders of Angels, dating from about 1500, are exhibited in Room 7. Of about the same date is a standing livery cupboard carved with open Gothic tracery; the ostrich feathers which form part of the decoration probably represent the badge of Arthur Prince of Wales, eldest son of Henry VII. This was found recently in a farmhouse at Burwarton, Shropshire, and was presented by Mr. Robert Mond, F.S.A., through the National Art Collections Fund (Room 6).

A fine piece of panelling, bearing the date 1546, has been purchased from a house known as Beckingham Hall, at Tolleshunt Major, Essex (Room 52). It is elaborately carved, with decorations in the style of the Renaissance, among which are the Royal arms as borne by Henry VIII. and those of Stephen Beckingham. The old Hall at Beckingham, from which the panelling originally came, was built by Richard Beckingham on an estate granted to him by Henry VIII. in 1543.

The Museum collection of painted wooden roundels (also in Room 52), which were in use in Elizabethan and Jacobean times, has been enriched by a very uncommon set consisting

of twelve pieces enclosed in a turned case, each painted in silver and gold on black, with figures wearing costumes of the period of James I.

An important example of early English lacquer is shown in Room 55. This is a cabinet of the period of Charles II., mounted with brass and decorated with raised lacquer in gold and colours on a black ground. The carved stand is silvered; this is an unusual feature, gilt being more usually employed for such a purpose. In the same room is a Queen Anne writing-cabinet, which is stated to have belonged to Dean Swift: it is veneered with walnut and decorated with fine marquetry-work, and is fitted with glazed doors above and with a secretaire below. It is figured in Macquoid's "History of English Furniture."

A gap in the historical sequence of English panelled interiors has been filled by the presentation from the National Art Collections Fund, assisted by a body of subscribers, of a panelled room of about 1730 removed from No. 26 Hatton Garden. The panelling is of pine, with elaborately carved mantelpiece, doorways, and recesses. (It is exhibited in Room 56.)

A fine example of English painted satin-wood in the form of an urn-shaped knife-box is placed in Room 57.

Of recent gifts not already noted, a so-called bridal chair of Saracenic work, which has been given by Mr. Rowland Ward, F.Z.S. (shown in Room 42), and two six-fold screens deserve special mention. One of these, which is of tooled and painted leather, and is probably Dutch, was given by Mr. Percy Woods, C.B., and is shown in Room 21; the other, in Room 41, of black and gold Chinese lacquer, was presented by Mr. S. Mavrojani.

THE PROSAIC IN AN ARCHITECT'S WORK.*

(Concluded from last week.)

THERE is one subject of vital importance in architectural work which comes within the latter category. This is the subject of structural design, within which may be included at one extreme the formation of the simplest type of cottage roof, and at the other such undertakings as the conception and elaboration of a dome like that of St. Paul's or a bridge like Waterloo Bridge. Most modern architects are exceedingly inconsistent in their treatment of this subject. So long as the problems to be solved are of a similar character to those which have been dealt with by members of his profession for centuries past, the average architect has no hesitation in applying his mind to them; but, given problems of a new character, and the use of new materials, he at once says, "These questions are beyond my ability and experience; I must call in the engineer." As a result the services of the architect are often dispensed with entirely, or, when he is employed, we obtain structures that are the design of two persons working from entirely different standpoints. If, as usually happens in the case of a bridge, the engineer is responsible for the initial scheme, the work of the architect, if he is not ignored altogether, is restricted to the application of ornamental features—or features that are intended to be so—to the engineer's design. The thought that the chief beauty of a bridge is in its general lines rarely appears to occur to either party. On the other hand, in the case of a large structural feature of a building, the architect first evolves the design, paying principal attention to the question of appearance. When complete, he turns it over to the engineer with a request that he shall settle in all details the form of the construction. Perhaps a few hours afterwards the same architect solemnly and—absurd as it may seem—in all honesty holds forth to students on the well-worn text that construction is the basis of all true design.

The reason for this failure on our part to place on a truer basis the more advanced branches of modern architectural design is undoubtedly a strongly rooted dislike of the study of the—to most architects—uncongenial subject of structural design.

It will be of interest to take note of the attention which is given in the several architectural colleges and schools to the subjects dealt with in this paper. The subjects of the building laws, the law as to light and air, and the law of contracts are usually classed, with a few other branches of work, under the heading of professional practice. Outside London it appears, from such information as is available,

that practically no instruction is given in these subjects in architectural schools. In most London schools a certain amount of attention is given to the building law, but apparently it is only in the Architectural Association schools that a general course of lectures on professional practice is given. Having regard to this, it may seem rather uncharitable to adopt a critical attitude, but criticism cannot be disarmed by the mere provision of a course of instruction without reference to the value of the course. A policy of declining to teach certain subjects is perhaps more capable of defence than one of arranging a course, which, on the face of it, is too short to enable the subjects to be taught properly. By the establishment of the course it is presumably conceded that the subjects included are ones of which an architect should have some knowledge. But under the present arrangement a student completes three years' training before he is officially informed that such subjects exist. Proper knowledge of any subject can only be obtained gradually; years rather than months are usually required. It therefore seems to be more than probable that the value of a course of lectures on professional practice, delivered to students towards the end of their training, would be greatly increased if students in their first year were brought in some way into touch with the elements of this important part of an architect's work. Doubtless this criticism can be met with the retort that during a period limited to four years it is impossible to teach everything. The problem of the training of the embryo architect is certainly a difficult one, and it must be admitted that the Architectural Association schools afford about the most levelheaded architectural education that is given anywhere.

In most architectural schools throughout the country the subject of structural design is in part taught under such titles as "mechanics of structures," "theoretical construction," "graphic statics," &c. But the teaching is usually confined to the dry-as-dust mathematical side of the subject. Other classes are held in which is taught the science of ordinary building construction, and there are, of course, yet other classes in what is termed "architectural design" where the treatment, however, is usually restricted to questions of planning and to the design of elevations on approved historic lines. One feels compelled to ask why it is not possible to teach the subject of architecture by dealing with a building from all standpoints—the planning, the construction as determined by mathematical calculations and ordinary practice, and the treatment of the constructional features in such a manner as to produce real and virile architecture. There are certain cases where we are instructed not to let the right hand know what the left hand does, but there is no authority for applying this precept to architectural education.

It is hoped that sufficient reasons have been produced to justify the statement that the various subjects in our work, which are usually stigmatised as dull and uninteresting, are nevertheless of very considerable importance. If this is so, it surely follows that they should be given a place in the forefront of an architect's studies. In no art, profession, or business is it contended that if certain studies are uninteresting they should therefore be neglected. In any case, if the established members of our profession demur at pursuing these studies themselves, they may not be unwilling to see them made compulsory in the case of students. This would afford still further grounds for the older men to expatiate on the increased educational advantages under which the present generation of students pursue their studies.

The time has now come when the title of this paper may be thrown overboard. These subjects as a whole are not prosaic. Of course, a good deal depends on the general outlook of the individual. There are persons—you find them principally on the Practice Committee of the Institute—who look upon the law of contracts as a highly enthralling subject. Up to the present I have not been touched with this enthusiasm. The building law, however, exercises a certain attraction. In studying the details of this subject there is always the zest of exploration. New uncertainties are always inviting investigation. The modern geographical explorer is beginning to have rather a bad outlook. Before very long the world will be so well explored that there will be nothing fresh for him to discover. But the person who takes as a field of exploration such a subject as the London building law need have no fears in this direction. As soon as he becomes reasonably familiar with the various by-paths he will find that the County Council have amended the law and there are fresh points for him to investigate. The subject of rights of light is by no means uninteresting, and

* A Paper read before the Architectural Association on November 25, by Mr. Horace Cubitt.

MODERN EUROPEAN ARCHITECTURE.
GERMANY.

RESIDENCES IN FLATS, BERLIN.—Herren HEINRICH & KAPROWSKY, Architects. [From *Berliner Architekturwelt*.]

should appeal to two distinct classes of architects. Those who like a battle of wits will find ample opportunities for a display of their abilities in the negotiations which are so often involved. Those who are interested in such subjects as geometry and optics may usefully devote time to the study of the effect of obstructions on the varying degrees of light received by ordinary buildings in thickly populated districts.

That the subject of structural design can possibly be considered prosaic is a most serious reflection on our modern method of training. The Roman architects and engineers who erected the mighty thermæ, aqueducts, bridges, and amphitheatres, which are still the wonder of the world, obviously did not consider the subject of structural design dull and uninteresting. The Gothic builders, it may be

assumed, took as keen a delight in the logical scientific construction of their buildings as they did in the execution of the mouldings and carving with which such construction was embellished. Coming nearer to our own time, it is only reasonable to suppose that the "great mathematician" expended as much thought and labour on the fine structural scheme for the dome of St. Paul's as he did on the design of any other feature in the building. It is necessary for us to realise that structural design is not a mere matter of calculations and formulæ. These things, however necessary they may be, are but means to an end, such end the achievement of a living architecture, founded, as was the case with all the historic styles, on the basis of logical construction.

Mr. Max Clarke, in opening the discussion, said that

for years at the Architectural Association he had advocated that the younger men should always make the speeches; he again advocated that the President should in future call on the younger members—especially the very young ones—to propose the votes of thanks and to second them. All architects were not hopelessly deficient in art; but the majority were hopelessly deficient in making a speech. To correct that defect it seemed to him very desirable in a place like that, where they were more or less at home, that the students should begin to speak in public. If they never began they would certainly never get on. He had to congratulate Mr. Cubitt on having the audacity to come there and tell them that they were not conducting their business in a proper manner. Whether he was right or not was a matter of opinion. Mr. Cubitt certainly deserved some amount of praise for the trouble taken in putting the paper together. Personally it did not seem to him a compliment to Mr. Cubitt that when a paper of that sort was read there were not many present in the room, while when a more interesting paper is given it is crowded. It was those matters which Mr. Cubitt was pleased to call "prosaic" which do not appeal to the younger or to the older generation. If he had his way he (the speaker) would never deal with a light and air case or a schedule of dilapidations. Some of those present would begin by sitting in their office for a year or two with nothing to do, until one day a man would come in and ask if they would draw up a bill of dilapidations for their property. If the young architect said "no" he would probably lose that client for ever. He had heard of a young architect who, on being asked by a client if he would make a survey, replied he would not, as he was waiting for an architectural job. One of the very first things a young man ought to learn was to measure a piece of ground and take the levels of it. The practice of architecture was very much in the clouds. Many of them commenced by hoping they would get a palace to design, and it ended by their getting a cottage to build for £150, or a cottage for £450 which usually cost £600. Should the young architect get one of those he had much to be thankful for; and if he cannot build a cottage and survey a piece of land he will never be able to build a palace. He disagreed with what Mr. Cubitt had said about the quantities. It had become more or less a practice for architects who were busy never to write their specification themselves; but again, if the young man cannot write a specification for a £150 cottage he will never build a palace. Moreover, if the student did not learn these things at the A.A. it was difficult to see where he would get the knowledge. He considered that unless a man was competent to do that he was not competent to design a building, not knowing how to put it together. He believed in excellent draughtsmanship, for it was one of the first things a student should learn, and in that he included design. If one was able to do that one might get a prize, and the latter was a sort of advertisement. An architect was much hampered because he could not insert an ordinary advertisement in the papers. His other method of advertising was to get a prize, and the next stage was to win a competition. If the young man could write a real specification there would be no difficulty in getting from that to the stage of preparing quantities. It was a good thing to know something about the latter, because it taught construction and a thousand and one things one ought to know but does not. One of the dreadful things for an architect was extras. His own opinion was that they would not creep up in the way they do if the architect knew exactly the amount of money he was spending and honestly told the client that such and such a thing would cost so much. He had been talking to an architect who told him that the extras on a particular job only amounted to £25,000, and for £5,000 of that he had still to go and settle with the client "if he could"! Some clients were becoming intractable in the matter of extras, and the Courts were upholding them more than they used. When a man got a fine practice he was able to pay anybody he liked to do all the things which were distasteful to him; but until he gets it he had to do them for himself. The question arose as to whether the architect can get the expert paid by the client. The position was awkward, for if the architect paid the expert himself he would have very little left for himself. Consequently the more the young architect could learn the more commission there would be and the better equipped he would be. He disagreed with what Mr. Cubitt said about the district or other surveyor; that official had no right to pass an opinion upon the plans—his province being to see that the architect did not go wrong in his actual work. He

might mention that he was a member of the Institute's Practice Committee—and that he detested the job. The Royal Institute had published a form of contract which did not safeguard the architect or the client properly. The only thing he was interested in was to get the Institute to alter the document and to bring it up to date so as to conform with the various Acts of Parliament, &c. He could assure them that from his own point of view he was not enthusiastic; but he thought somebody ought to take the matter in hand—the sooner he had done with it the better he would be pleased. The architect required to be always thinking about his work. It was an open question whether they could be thinking about football, dances, &c., and be learning architecture at the same time. In the main he agreed with Mr. Cubitt's paper, though with some points in it he did not. The thing that occurred to him was how on earth the student covered the multitude of subjects he did already. He came into contact with the A.A. work submitted in the Institute's examinations, and he thought it reflected the greatest credit on the teaching of the Architectural Association.

Mr. Alec G. Horsnell remarked that in the course of his paper Mr. Cubitt had reserved his opinion as to whether the subjects he advocated were or were not prosaic. Really he himself did not think they were. He considered them, in fact, most interesting. For instance, the grasping nature people often revealed in connection with ancient lights was in itself a study of human nature, quite apart from anything learnt as to law. But he did not think such things had anything to do with architecture. The architect's mind required something entirely different to what was required, say, for preparing quantities. Mr. Cubitt had opened fire on them, and no doubt some of them were slacker in the subjects discussed than others. But the architect can always go to someone for advice, and it was hard to understand why he should not do so.

Mr. Louis Jacob thought that the matters mentioned by Mr. Cubitt, whether prosaic or not, were most important to an architect starting practice. Apart from the fact that he may lose a client by not being able to do such things, it would be found that the client's lay mind can best appreciate such questions. That was an unfortunate fact, no doubt, from the architect's point of view. An architect will always find it desirable to take his sketches to the district surveyor and talk matters over with the officials in a friendly way, for he will learn more in that way than by hours of study of the regulations. Speaking from his own experience, he could say he had always found the surveyors most courteous. The law on those matters wanted codifying, especially in London. Among the many things he had started on was this codifying, but he gave it up, as the project was too gigantic. Unfortunately the Colls case was immediately modified by the decision in "Kine v. Jolly," which decision seemed to him to be a gross miscarriage of justice and to make confusion worse confounded. An architect in a big practice would not bother himself about such outside matters. One piece of advice was that whatever an architect did he was to keep solicitors out of any case he might be engaged in. Unfortunately, though the R.I.B.A. Conditions of Contract were unsatisfactory, the builders declined to alter them.

Mr. A. O. Collard said that Mr. Cubitt was well known to most of those present as editing that valuable "Building in London." When he first saw the book it struck him as so useful that he advised its inclusion on the list of works recommended to the students of the A.A. Perhaps a better title for the paper that evening might be "The Mosaic in an Architect's Work." The word "prosaic" did not apply to any aspect of such work. Many papers on architectural subjects seemed dull because architects were not all endowed with sparkling wit. He believed it to be absolutely correct for architects not to undertake the valuation of properties or the preparation of the quantities. Architects cannot be supposed to have the time to do everything for themselves. If any young architect were called upon to undertake a valuation he would advise him to have nothing to do with the offer, or at any rate to call in the help of someone who understands the work. Most architects were willing to drop their use of the word "surveyor" and to call themselves simply architects—assuming that the greater included the less. The words architect and surveyor are both old, and it is known that Wren always was called surveyor. A mistake in a musical composition such as Mr. Cubitt had alluded to by way of simile did not involve other people; whereas a mistake in an architect's work did. It should not be necessary to lop a design, as

MODERN EUROPEAN ARCHITECTURE.
GERMANY.

"KAUFMANNSHAUS," BERLIN.—Herren ADOLPH WOLLENBERG & EMIL SCHUSTER, Architects. [From *Berliner Architekturwelt*.]

described by Mr. Cubitt, if it were submitted in its pencil stage to the district surveyor. He believed an architect would welcome being associated with an engineer in the construction of such a beautiful thing as a bridge. He was not aware before that evening that the subject of structural design was to most architects uncongenial. He himself considered it most thrilling. It had occurred to him that the subject of professional practice might be dealt with earlier in a student's work than it is now. But he had found when they do come to take up the subject they were not altogether ignorant of it. He honestly

believed that by the fourth year the student mind was most open to the subjects dealt with under professional practice. It was a constant endeavour with the staff at the Association to see those subjects were not dull and uninteresting. He was not at all sure whether really the students would get much advantage by tackling them earlier than they do at present. He could assure Mr. Cubitt there was scarcely a moment to spare. If any work were knocked out to make room for the suggested subjects the curriculum would not be so satisfactory. They could not crowd into the lives of the students more than they do now.

The President, in summing up the discussion, said that it had been his intention to say something from the students' point of view, as the younger members had not risen to speak. But Mr. Collard had already done so. It was not possible for the student of architecture, at any rate in his second or third year, to go very deeply into the important matters raised by Mr. Cubitt. He had too much to do in subjects of purely architectural quality. In the student's fourth year it was a different thing. If a man came to the Architectural Association schools for the fourth year he was working during the day-time in an architect's office, and he would be there brought into touch with these points of professional practice. In the excellent course of lectures on professional practice in the schools he was able to acquire a working knowledge of what it was necessary for him to know. Of course, those lectures only gave the student a thorough outline. Such special subjects as quantities engaged the whole life-time of those who properly took them up. It was really very much better for a young practitioner not to take up subjects he did not thoroughly understand, for he could always call in an expert. He entirely agreed with what had been said about discussing questions with the district or other surveyor. Such an one was a very valuable person, and if architects brought their drawings to him before they were inked in there would be fewer mistakes made in practice. District surveyors were gentlemen of the utmost courtesy and most anxious to help their professional brethren. With reference to Mr. Cubitt's remarks about the attitude of the student to structural design, he would remark that if there was one subject which interested a student more than another it was that; he was taught from the very first that structure was at the root of his design, and that he could not make a proper design without considering it from the structural standpoint. The subject was dealt with very thoroughly in their curriculum.

Mr. Horace Cubitt, in briefly replying to the vote of thanks, said that everyone ought to know enough of quantities to know he should not do them himself. If structural design was adequately taught it was a curious thing that it was a general practice for modern architects not to design their own steelwork. Surely steelwork was structural design? It was difficult to see how an architect could maintain that construction was the basis of his design if he got someone to do his construction for him. At present the construction was muddled through after the architect has designed the elevation and made the plan. It seemed to him illogical that an architect should be expected to be able to design a grain silo, but not a bridge. Everyone could get a certain degree of knowledge, so that it would be possible for him to know how to design something after the manner of those who designed in past centuries. It was a mockery for architects to assert how fond they were of structural design, and then to admit they were not capable of doing it and that it was an engineer's job.

At the end of the meeting it was announced that the next meeting will be held on December 9 at 8 p.m. Papers entitled "The Practice of the Crafts in Modern Building" will be read by various members. It will be a combined meeting with the Art Workers' Guild.

Fire Protection in London and the London County Council.

SIR,—Since drafting my letter of November 25, which you did me the honour of printing in your last issue, the Chairman of the Building Act Committee of the London County Council (Mr. Taylor) has been at pains to show that his Building Act Department has been more active during the past seven years in dealing with the London Building Act Amendment Act of 1905 than indicated in my communication, where I pointed out that only 527 buildings had on official showing been put in order up to June 12 last, and that some 50,000 cases were awaiting the Council's attention.

Mr. Taylor, in the interests of the County Council, emphasises the fact that 1,043 certificates were granted in respect to new buildings under Section 7 since 1905, and he also put on record that 351 cases have been disposed of under

Section 11 and 4,430 applications for exemption have been granted under Sections 10 and 12.

I had no reason for complaining of inattention to new buildings, for I was fully aware that these new structures in respect to which the owners deposit plans are dealt with as a matter of routine.

I was complaining of *existing* buildings, and, my letter being due to the deaths resulting from the Kensington fire, I naturally referred to buildings coming within the same section of the Act as Messrs. Barker's premises, i.e., Section 9.

In putting forward the fact that 351 cases have been settled under Section 11 and 4,430 cases under Sections 10 and 12, Mr. Taylor has raised an entirely new issue as to a further class of existing buildings, which I also consider to have been badly neglected by the London County Council, even if perhaps not as markedly neglected as those coming under Section 9. This class of building includes the dangerous "projecting shop" and a large number of smaller buildings, exceeding 30 feet in height, occupied "other than as a dwelling-house by two or more families."

According to the evidence of the Superintending Architect before the House of Commons, no less than 48,566 such cases under Sections 10 to 12 have been notified to his Department as requiring attention. Thus, in addition to there being some 50,000 cases awaiting attention under Section 9, there are to-day as a matter of fact also some 44,000 cases still awaiting attention under Sections 10 and 12.

To put it quite plainly, Mr. Taylor, being dissatisfied with my complaint in respect to the 50,000 cases, now compels me to point to a further 44,000 cases, making 94,000 cases in all awaiting the Council's pleasure since 1905.

It had not been my intention to bring two issues forward at the same time. The 50,000 cases were to my mind sufficient to go on with, but now that fresh issues have been raised I consider it my duty to extend the scope of the matter complained of, and to say that, whilst in the first instance the inattention is largely due to the Council not giving the Building Act Department a sufficient staff and proper encouragement, in the fresh matter the inattention is largely due to what I consider the Council's policy of not allowing the district surveyors to undertake certain duties which they are quite competent to carry out, and which should largely have been carried out by them under the Act.

Complaint has further been made that when I said the 50,000 cases could be dealt with in the course of the next five years, this would be impossible, and would be inflicting hardships. I wish emphatically to state that it is quite practicable and feasible to attend to the 50,000 cases with a suitable and well-staffed organisation in the course of five years, and further that the district surveyors of their fifty districts can easily attend to the majority of the 44,000 cases newly referred to without putting much, if any, strain upon the County Council's Building Act Department. It is largely a matter of the earnestness of the Council, of staffing and of organisation, and of further allowing the district surveyors to do their duty without undue interference.

Some other critics have suggested that if all these structural alterations were carried out within the next five years there would be a great disorganisation in the building world of the metropolis. These critics are entirely mistaken. The amount of alteration in quantity and value is comparatively small compared with the quantity and value of building work done during any active building period of similar length between 1880 and 1910.

I regret again to have to occupy such valuable space in putting forward these facts and making complaints regarding the sluggishness of the London County Council in respect to the administration of the Building Act Amendment Act of 1905, but this question of fire protection is one affecting such a large number of buildings and such a large number of lives that it is impossible to let the present state of affairs rest.

The London County Council, in its corporate capacity, must be made to realise its duties and grave responsibilities as to safety of life in our metropolis.—Yours truly,

EDWIN O. SACHS.

STAINED GLASS COLLECTING.

A GOOD many architects' offices contain fragments of old stained glass which has been rescued from complete destruction for the sake of its interest as an exemplar of ancient art and craft, and the circumstances of architectural practice frequently offer opportunity for picking up old bits; but it seems that in the perpetual seeking for new fields of bric-à-brac, collectors have begun to turn their attention to old stained glass from the point of view of possession rather than appreciation, from which arises the circumstance that the age, genuineness and rarity of the specimen makes its value for them rather than its evidence of artistic endeavour or craftsmanlike skill.

The collection of stained glass has indeed become so far a recognised branch of connoisseurship, that it is worth while for men to exercise their skill in the forgery of quasi-antique glass.

It is unfortunately true that when a particular class of objects becomes a sufficiently fashionable vogue the forger enters the field to provide spurious specimens for the ardent collector possessed of cash and deficient in knowledge.

Those therefore who propose to commence collecting old stained glass with any view of making a profit or even of enjoying the pleasure of possession at the proper price must devote attention to learning the special features, marks and characteristics which distinguish the productions of different ages, the omission of which may frequently lead to the detection of a forgery.

We cannot say that their absence will inevitably and always distinguish the spurious from the genuine, because the forger of sham antiques usually knows his subject and his work, and there is no reason why the twentieth-century imitator of fifteenth-century work may not approach very closely to the productions of his predecessor, if he is prepared to take sufficient trouble, and give sufficient time to his imitation. Even the effects of age can be simulated to a close approximation of the genuine. Fortunately for the collector who knows his subject the forger does not always find it sufficiently profitable to make his fake complete.

Sometimes, however, the zeal of the modern collector raises the price to a level far above the intrinsic value of the specimen, so that it is worth the forger's while to spend an abnormal amount of time and trouble in producing something so closely approximating to the genuine antique as to deceive even the expert.

Perhaps the soundest advice that can be given to the

beginner in collecting stained glass, and, indeed, one might almost say any specialty, is, first of all, never buy anything which is high priced; secondly, never buy a complete and perfect specimen. The beginner should content himself with broken fragments and low priced specimens; he is less likely to have forgeries foisted upon him, and if he is victimised his monetary loss is reduced to a minimum.

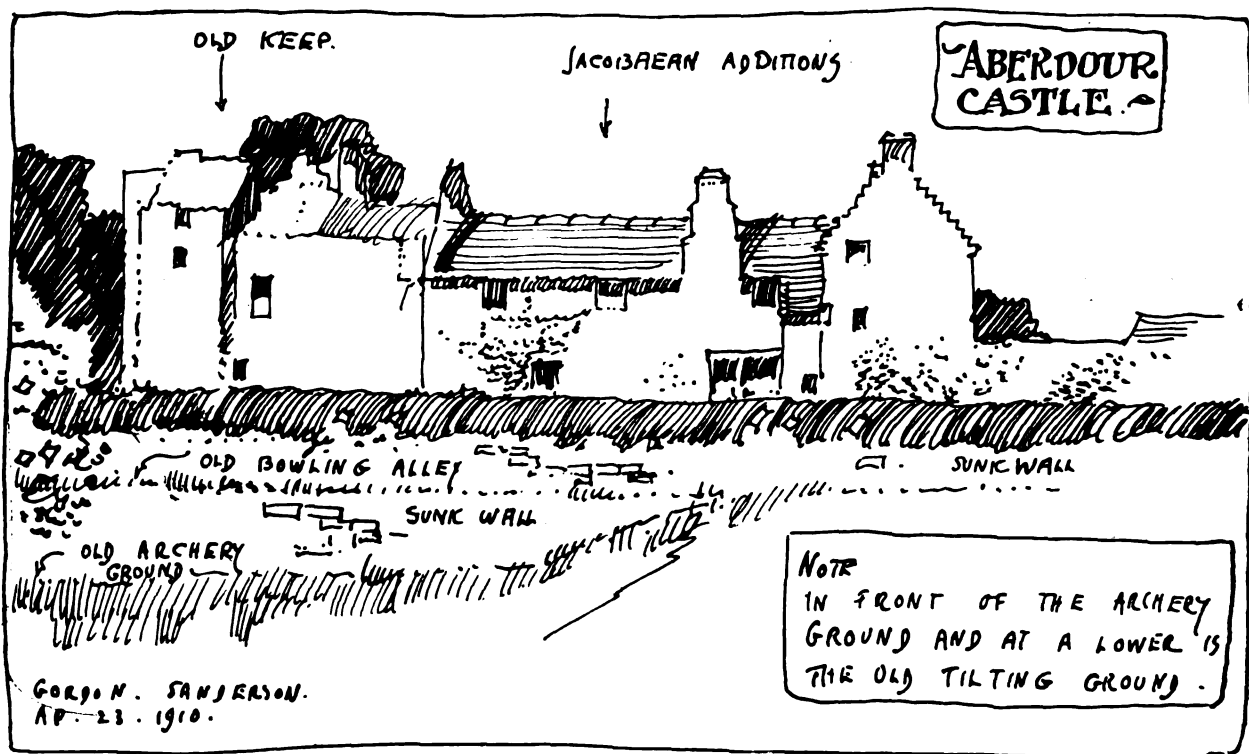

There is, of course, always the chance of being landed with spurious imitations, but that is part of the game of collecting. The collector pits his wits against those of the fraudulent dealer and he cannot always expect to come off victor.

As an assistance to the collector in his early essays, Mr. Maurice Drake's "History of English Glass Painting," would be of considerable value.* The name of this book is rather a misnomer, as the history of English glass is rather an introduction to special chapters and illustrations of Swiss glass; indeed, a very considerable portion of the plates, which are printed in colours, is devoted to Continental examples of glass painting.

Although, however, we must regard this history of English glass painting as an introduction to Swiss work, we nevertheless have a very good account of English stained glass written from the point of view of technique, the professed object of Mr. Drake's work being to assist the collector to acquire that elementary knowledge which will enable him "to buy with intelligence, to know the approximate date of this or that dirty piece of glass that may come in his way, to recognise it as genuine or spurious, and further to advise what he shall do with it once it is in his possession."

It is scarcely likely that the collector will come across many pieces of twelfth or thirteenth-century glass, but it is well that he should know what are the peculiarities of these early periods, so that if by chance a treasure should come his way he may be able to recognise it. The classic authority on early art is the manuscript of the Monk Theophilus, entitled *Diversarum Artium Schedula*, from which we may learn that what we now call sheet glass was one of the methods of manufacture then employed, and although he does not mention it we know that crown glass was also made. The striae of this glass are deeply marked, frequent, parallel and nearly always follow the segment of a circle. The thickness and lack of

* *A History of English Glass Painting, with some remarks upon the Swiss glass miniatures of the sixteenth and seventeenth centuries.* By Maurice Drake. Illustrated by 38 Plates from drawings by Wilfred Drake (London: T. Werner Laurie, Ltd. 42s. net.)

transparency is a characteristic of this glass, while the condition of the surface will be either entirely free from corrosion, or pitted with large well marked circular holes, or evenly rotted and covered all over with chalky patina. Another important mark of early glass is the presence of coarsely chipped edges, for it was only in the sixteenth century that the diamond came to be used for glass cutting. There are other characteristics of very early glass as regards its design and colouring which are indicative and will be recognised by the collector after he has had experience, but these are more easily imitated by the forger.

The glass of the fourteenth century has several criteria which distinguish it from earlier work. The first appearance of yellow stain and abrasion, the first use of white glass for flesh, generally with hair stained yellow, the first appearance of heraldry, and the first employment of stippled shadows.

The glass of the fourteenth century was usually of excellent quality and is often entirely free from corrosion or patina. When corrosion does appear it generally takes the form of scattered pits, smaller than but as clearly defined in form as those of the thirteenth century. The striae and minor irregularities gradually disappeared from the surface of the glass in the improvement of manufacture, for by this time glass-painting and glass-making had become separate crafts.

There are also as before distinctive differences of drawing and colouring in this century, and in the latter half, particularly, the predominance of yellow due to the delight with which the discovery of silver stain was received is a distinguishing characteristic.

The painted glass of the Perpendicular period may be recognised by its relative thinness, compared with early glass; its colour quality, which, if white, should be nearly pure, if pot metal showing the prevalence of secondary or tertiary colours, more particularly in the purplish tone which begins to invade the blue, whilst the ruby often has a tendency towards a brown or pinkish shade. Especially should be noted the smoothness of the glass surface, the reaminess and imperfections of the fourteenth century having almost disappeared. The corrosion holes are smaller and less circular than in early glass and not so frequent as in later examples. Again we have also a characteristic difference in drawing and composition. The prevalence of white glass, the occurrence of secondary or tertiary colours, the use of the

quarry and the characteristic silvery white canopies are all distinctive.

In Renaissance work of the sixteenth century we find the first appearance of enamel colour and the first employment of the diamond for cutting, and the lead vice for forming cameos. There is a great increase in the practices of abrasion, insertion, and annealing. The glass also is thinner and smoother and approximates in weight and texture to common modern 15 or 21 oz. sheet. In treatment large pictorial subjects extending through mullions and tracery become favourite. There is in short an attempt at pictorial representation which sometimes runs counter to the hard and fast conditions of glass designing.

Far heavier painting is used than in any of the Gothic styles. Matt is laid and stippled dry in a level coat, from which the lights are afterwards wiped out with a stiff hogshair brush. These tendencies led on to the decadence of stained glass in the seventeenth-century work and its supersession by painted glass.

This development was naturally enough accompanied by a corresponding change in the manufacture of the glass; pot-metals are pale and poor and are generally crown glass, whilst the white is almost invariably sheet and of better quality, particularly in the latter half of the century.

These are some of the points which form the A B C of the glass collector's education and are explained in full by Mr. Drake, together with many other features characteristic of various periods which we have not sufficient room to include. Some considerable knowledge of heraldry for example is almost a necessity for the collector.

We noted earlier that Mr. Drake had devoted a considerable portion of his book to the description and illustration of Swiss stained glass, and the reasons that he assigns for so doing are that "the essential subject of the book is treated primarily for the information of collectors of old stained glass, that Swiss glass is held in the highest possible esteem by all such collectors, and, finally, that although the works of the Swiss glass-painters of the sixteenth and seventeenth centuries have been exhaustively reviewed on the Continent, where a large number of French and German writers have sedulously devoted themselves to their study, no English book upon Swiss glass seems to be in existence."

As we look at Mr. Drake's illustrations of Swiss work, we recognise that it is but a local school of German glass-

painting, and might very well have been produced in Nuremberg or any other centre of German art craftsmanship.

NOTES AND COMMENTS.

THE report of the Select Committee on the various Ancient Monuments Protection Bills now before Parliament recommending that the Ancient Monuments Protection Bill first introduced into the House of Lords should be allowed to proceed has been published as a Blue Book. The Committee have examined several witnesses, including Mr. C. R. Peers, Sir R. Anderson, Mr. T. Ross, Mr. Reginald Blomfield, A.R.A., and Mr. Thackeray Turner.

The Committee made several recommendations with a view to improving and speeding up the provisions of the Bill that they recommend for adoption. Thus they advise that a preservation order should be allowed to lie for so many days on the table of both Houses of Parliament to be confirmed, unless within that time an address to his Majesty against that order has been presented by either House; also that in case of emergency, especially when Parliament is not sitting, provision should be made that prompt action should be taken, either by the owner with the consent of the Commissioners, or by the Commissioners themselves, to save a monument in imminent danger where delay might be disastrous.

The Committee think that in the case of an ancient monument declared by the Commissioners of Works, on the recommendation of the advisory board, to be a monument of national importance, and after the opportunity has been given to the owner to be heard, the consent of the Commissioners of Works should be obtained before any structural alterations are undertaken, which consent should not be unreasonably withheld, and such monuments should be exempt from probate and death duties.

The Committee do not think it necessary to prevent the sale of ancient monuments provided that they are secured from destruction, damage, neglect, or injudicious treatment.

With regard to ecclesiastical buildings, the Committee suggest that in a case where a faculty is asked for a public advertisement in the principal papers circulating in the diocese should be published, with a notice that the plans might be examined in the Diocesan Chancery, and a reasonable interval should be allowed within which criticisms or suggestions might be made to the Chancellor. They think further that whenever serious criticisms are made the Chancellor should secure the advice of a small committee, say, of three competent architects of repute, and that in granting the faculty due regard should be had to their report, such report and the final form of faculty being made public.

It is recommended that the Commissioners of Works and the advisory board should be assisted by a sufficient number of inspectors of ancient monuments to visit periodically and to report to the Commissioners on the condition of ancient monuments in their district, and a strong opinion was expressed by the Committee that a special department in the Office of Works should be organised to deal with the work that must necessarily fall on such Office under the Bill.

The battle in Manchester over the Piccadilly site is still continuing, and in the inquiry now proceeding several leading architects have recently given evidence. Mr. John Brooke, as President of the Manchester Society of Architects, expressed the general view of the Society that it was desirable that an Art Gallery and Free Library should be built on the Piccadilly site.

He expressed his personal opinion that the present Exchange could not be satisfactorily extended, and he also objected to the extension of the present Art Gallery. He thus seems to us to put the whole question very clearly. Manchester needs a new Art Gallery and Library; it also needs a new Exchange building. Neither of these necessities can be satisfactorily provided by an extension to,

or alteration of, either the present Art Gallery or the present Exchange, therefore sites must be found for both new buildings.

The Piccadilly site is suitable for either. It remains, therefore, for the Corporation finally to make up its mind which of the two new buildings shall go on the Piccadilly site, and what new site can be provided for the other. Mr. Brooke suggests that the land bounded by Market Street, Corporation Street, Cannon Street, and New Brown Street would provide a suitable site for the new Exchange.

The restoration of the roof of Glasgow Cathedral is now practically completed, and it is intended that the new building shall be rededicated at a special service on Sunday, December 22. We have in a former number given a description of the work carried out to the roof, which has been the principal part of the recent works of restoration. The stained-glass windows have received attention, and although of a bad period, have been to some extent improved from the practical consideration of lighting, although the cleaning has removed the merciful toning of dirt.

The Flintshire Education Committee has been discussing the ancient problem of the acceptance of the lowest tender. In some recent instances in this Authority the lowest tenderer has been set aside in favour of a local man, and the point of discussion has been whether it is more equitable to save the ratepayers the additional cost by accepting the lowest tender or to assist the ratepayers by giving the work to a local man.

The crux of the question, of course, lies in the fact that the additional cost affects the whole of the ratepayers, whilst only a section derive a benefit from the retention of money in the district, not a small section, however, as in our modern complex system of civilisation it is difficult to say how far through its ramifications extends the expenditure of any given sum. The solution of the problem will probably depend upon the magnitude of the saving as compared with the total expenditure. In the particular instance which the committee were discussing, the amount of the contract was £1,080, the accepted tender being £12 above the lowest. We should think that in this instance the community would benefit more by the expenditure of £1,080 amongst themselves than by a saving of £12. Nevertheless, the committee passed a resolution "that it be an instruction to all sub-committees in the case of contract work to recommend for acceptance

the lowest of the tenders received unless there is good reason for believing that the individual or firm giving such tender will not be able to carry out the work so satisfactorily."

An important report by the Education Committee of the London County Council has been presented for the consideration of that body, on the training and employment of boys in the building trades in London. This report is the result of the Committee's consideration of (1) an apprenticeship scheme suggested by the Institute of Builders; (2) a report of the London Association of Master Decorators; (3) proposals for the reorganisation of the building department in the Northern Polytechnic; (4) a scheme for a building trades school at Hammer-smith; (5) the formation of consultative committees in connection with the building trades. The Committee has had in view two aspects of the problem: (1) The question of the methods by which the best artisans can be trained; (2) the question of training the ordinary hands; and the present report deals with the former of these questions, that is, the training of the better class artisans, those who ultimately become the best workmen and foremen, possibly even managers. Stated shortly, the scheme which the Education Committee now propose to ask the Council to approve provides for (1) the award of ten additional scholarships a year at the Brixton School of Building; (2) the transfer to the Northern Polytechnic of the building classes of the Hackney Institute, together with the ten scholarships attached to these classes; the award of ten additional scholarships in engineering at the Hackney Institute in connection with the accommodation vacated by the building classes; the development of a trade school in the building department at the Northern Polytechnic to provide in the first year for thirty pupils, comprising twenty-five scholarship holders (including ten transferred from Hackney) and five fee-paying pupils, sixty in the second year, and ninety in the third year; and (3) the erection of a new art school in West London, the accommodation at present used by that school to be adapted for the purpose of a building trade school to which is also to be transferred the building trade classes at present held at the Paddington Technical Institute, such transfer being accompanied by the award of further scholarships each year at the new school. Application has also been made by the governors of the Northern Polytechnic for a building grant of £10,000 for the extension, but consideration of this matter has been adjourned by the Education Committee, and we understand that the necessity for the extension is not likely to occur in the immediate future.

THE ARCHITECT'S STUDENTS' SKETCHING AND MEASURING CLUB.

THE study of wrought ironwork is one that ought to receive careful attention from every young architect, since it is impossible to design ironwork without knowing how it is constructed, what are the possibilities afforded, and the limitations imposed by the craftsman's handiwork which must be considered by the designer. A knowledge of these things can be very largely acquired by an intelligent study of the work of the past, which will be all the more fruitful if it has been preceded by observation of craftsmen at work. The design of wrought ironwork is not merely the arrangement of straight and curved lines with or without foliage applied in a pretty pattern or elevation. The section of every piece of metal should be considered together with the amount of work that can be done whilst it is hot, the number of times it must be heated before it is finished, and the method by which the various pieces are fastened to each other.

"Chelt" has drawn a balcony from Versailles of early eighteenth-century date now in the Victoria and Albert Museum, a very elaborate and intricate piece of work, almost a *tour de force*. A complete study should embrace many more details than are included on "Chelt's" drawing, which, however, is good as far as it goes.

Mr. G. C. Styles also has measured a French balcony front from Paris now in the Victoria and Albert Museum, not quite so intricate as "Chelt's" but really better in design. Mr. Styles' drawing is also short of details, and it is not quite apparent how some of the construction is managed.

"Alpha" has found an excellent piece of English work in the north choir aisle of Beverley Minster, and has drawn it excellently, with a number of notes indicating the sizes of parts that make the work understandable.

"Plato" has selected a piece of the magnificent choir screen at St. Paul's Cathedral, the elevation of which is well drawn but lacks a sufficiency of detail to make it completely informative. It is not quite clear, for example, what happens when a $\frac{3}{4}$ in. by $\frac{3}{4}$ in. bar meets a $1\frac{1}{2}$ in. by $1\frac{1}{2}$ in. "Plato's" drawing, read literally, indicates that they are flush on one face, but this can hardly be correct. Still more puzzling is the manner in which a 1 in. by 1 in. bar stands on a $\frac{3}{4}$ in. by $\frac{3}{4}$ in.

We award prizes of half a guinea each to "Chelt," Mr. G. C. Styles, "Alpha," and "Plato."

NOTES ON BOOKS.

"The Everyday Uses of Portland Cement." Second Edition, 1912. (London: The Associated Portland Cement Manufacturers (1910), Ltd. Paper covers, 1s. 6d. net; stiff covers, 2s. 6d. net.)

The many uses to which Portland Cement and Portland Cement Concrete can be put are well set forth in this handbook published by the Associated Portland Cement Manufacturers (1900), Ltd., and even those of us who have a general acquaintance with concrete and its practical uses may learn something from the detailed descriptions and illustrations which are included. For example, the difficult question of painting cement and concrete surfaces is clearly and frankly explained, and so also is the trouble of efflorescence and its remedy. A series of illustrations of various classes of work in which concrete, reinforced or otherwise, has been used, contains both useful and interesting information.

"The Law Relating to Highways." Second Edition. By H. Hampton Copnall, solicitor, clerk to the Notts County Council. (London: Charles Knight & Co.)

The first edition of this work was published in 1905, and the fact that a second edition has become necessary shows that it met a want and that a book on the Law of Highways was needed.

With appendix and index we have in this new edition a volume of over 750 pages, and about 80 pages of statutes and cases cited. A large number of cases have been decided since 1905. These and many practical points on the administration of Highway Law are considered and determined.

The book has been largely rewritten, and the introduction of more headlines and the breaking-up of the chapters into concise paragraphs on particular subjects will be found an improvement and render the volume much more useful.

It is a book of great help to all interested in the administration of the law relating to Highways, and should find a place on the book-shelf of officials and laymen who take an interest in this particular subject.

"Photographic Lenses." A simple treatise by Conrad Beck and Herbert Andrews. Seventh edition, completely revised with index. (London: R. & J. Beck, Ltd. 1s.)

Everybody nowadays indulges more or less in photography, and whether the camera user is content to follow the injunction, "You press the button, we do the rest," or aims at the highest level of pictorial photography and a honoured place in the annual exhibition of the Royal Photographic Society, one and all will find it desirable to

understand the nature of the lenses that are used in modern cameras with their capabilities and limitations. Whatever form of camera the photographer is using, he will learn by perusal of the cheap but thorough little book before us that he must not expect one lens to do everything; that if he has a lens of general utility, it has only been designed and manufactured by a compromise between incompatible qualities. Having read and carefully studied this book he will be able to decide what particular kind of lens is most suitable to his requirements, what qualities he is desirous of retaining, and with what he is prepared to dispense.

The publishers, being makers of lenses, it is only natural that their productions are prominently displayed, but even though a book of this extent may be regarded in some sense as an advertising medium, there is so much accurate and full information that it is necessary for the photographic reader to possess the book in order to obtain the full value of his lens.

"Practical Sewerage and Sewage Disposal." By H. C. H. Shenton, F.S.E., M.I.Mun.E., M.R.San.I. (London: S. Edgecumbe Rogers. 3s. 6d. net.)

It can hardly be expected that a small octavo volume of 148 pages gives sufficient space for all that might be said on the subject of sewage disposal, but we have here a useful introduction to the general subject, which rather tells us what can be done in the way of sewage disposal than how it is to be done.

ROYAL ACADEMY SCHOOLS' PRIZE DISTRIBUTION.

THE annual distribution of prizes to the students in the Royal Academy schools took place on Tuesday evening last, the 10th inst., before the usual large gathering of Royal Academicians, Associates, and students and their friends.

Sir E. J. Poynter, P.R.A., gave the following short address before announcing the awards:—

It is with great regret that the Royal Academicians have awarded second prizes only for the Paintings from the Head and the Paintings from the Life. But they felt that they could not do otherwise, in view of the very inferior quality of these works this year. We put this down, however, to the fact that these works were done under the new conditions in the Schools, which are not yet fully in working order, and in the case of the Heads to the exceptionally dark weather when these paintings were executed. On the other hand, we have nothing but praise for the paintings of still life, and the merits of these hold out hope that when the students who have done them pass into the Upper School they will acquit themselves equally well before the living model. The Creswick Prize works are also exceptionally good, the best, in fact, as far as I remember, we have had on these walls. They show evidence of careful study and love of nature, and just what such work should be. The members thought the competition was so good that a second prize of £5 has been awarded. I am also glad to point out that the average of the "Designs for the Decoration of a portion of a Public Building" are also above the average.

The complete list of prizes and prize winners is as follows:—

Landscape Painting.—"In an Orchard." Creswick Prize (£25) and silver medal, Evelyn Muriel Young; extra prize (£5), Una Hook.

Design for the Decoration of a Portion of a Public Building.—"Romans Disembarking Slaves." First prize (£30) and silver medal, James Williams; second prize (£10) and bronze medal, Gerald Leslie Brockhurst.

Design in Monochrome for a Figure Picture.—"Joseph's Brethren bringing the Coat of Many Colours to Jacob," Genesis, chapter xxxvii. 31-32. Armitage prizes, first (£30) and silver medal, Horace Edward Quick; second prize (£10) and bronze medal, Hilda Marion Hechle.

Composition in Colour.—Prize (£10) and silver medal, Florence Margaret Walden.

Cartoon of a Draped Figure.—"An Orator": to be treated classically. Prize (£25) and silver medal, not awarded.

Two Paintings of a Figure from the Life.—First prize (£10) and silver medal, not awarded; second prize, bronze medal, Robert John Swan.

Two Paintings of a Head from the Life.—First prize (£5) and silver medal, not awarded; second prize, bronze medal, Florence Margaret Walden.

Perspective Drawing in Outline (open to painters and sculptors only).—"The Bromley Palace Room in the Victoria and Albert Museum." Prize (£5) and silver medal, no competition.

Set of Four Drawings of a Figure from the Life.—First prize (£15) and silver medal, Horace Edward Quick; second prize (£10) and bronze medal, Hilary F. Cleveland Skinner.

Set of Three Studies of Drapery.—Silver medal, Hilda Marion Hechle.

Drawing from the Antique.—Prize (£5) and silver medal, Nancy Wordsworth Arnold.

Painting from Still Life.—Prize (£5) and silver medal, Sylvia Ellen Gaunlett.

Model of a Design.—"Sisera and Jael." Judges, chapter iv. 17-21. First prize (£30) and silver medal, Alfred Henry Wilkinson; second prize (£10) and bronze medal, Joseph Herman Cawthra.

Two Models of a Bust from the Life.—First prize, silver medal, not awarded; second prize, bronze medal, Alfred Henry Wilkinson.

Model from the Antique.—Prize (£5) and silver medal, Allen Howes.

Design containing Figure and Ornament.—"Gathering Grapes": the vine to be treated ornamentally. Prize (£5) and silver medal, not awarded.

Set of Three Models of a Figure from the Life.—First prize (£15) and silver medal, Allen Howes; second prize (£10) and bronze medal, Peter Induni.

Design in Architecture.—"An entirely detached Town Residence for a Nobleman in a Capital City overlooking a Public Park on its West Side." Travelling Studentship (England), £60, tenable for one year, Oliver Frederick Savage.

Set of Architectural Drawings.—First prize, silver medal, Augustus Gaffett Bryett.

An Architectural Design.—"The West Front of St. Martin's-in-the-Fields, including the Tower and one Return Bay." Prize (£20) and silver medal, Chas. Frederick Butt.

An Architectural Design (First Term Students only).—First prize (£15) and silver medal, Geoffrey P. Agnew Fildes; second prize (£10) and bronze medal, Wm. Henry Hamlyn.

Perspective Drawing in Outline (open to Architects only).—"The East End of St. Martin's-in-the-Fields." Silver medal, Walter Llewellyn Clark.

Original Composition in Ornament (open to Architects only).—Prize (£5) and silver medal, Harold Thomas B. Barnard.

Architectural Design with Coloured Decoration.—"One Bay of a Hall for a City Company or Guild." £5 and silver medal, Augustus Gaffett Bryett.

Landseer Scholarships in Painting and Sculpture, of £40 a year each, tenable for two years, have been awarded—in Painting to Horace E. Quick and Douglas S. Gray; in Sculpture to Alexander Stiles and Allen E. Howes.

THE ARCHITECTURAL ASSOCIATION.

A COMBINED ordinary general meeting of the Architectural Association with the Art Workers' Guild was held on Monday, the 9th inst., at Tufton Street, Westminster, S.W., Mr. Gerald C. Horsley, president, in the chair.

Mr. Horsley made a few introductory remarks after the formal preliminary business had been completed. He was, he said, very pleased to welcome those members of the Art Workers' Guild who had accepted the invitation of the Association to be present that evening. Some of the members might not perhaps know much about the Guild, though it was a very famous body. The society comprised within its ranks artists following different crafts—there were something like thirty represented. That was the chief object of the founders when the Guild was established about twenty-eight years ago. He (Mr. Horsley) felt proud of being able to say that he had been one of these founders. Their object was to afford some opportunity for men practising various crafts to meet together. Such opportunities had previously been very few, and craftsmen were not well organised. It had proved a very successful society, and was at the present moment in a most flourishing condition. The members had reaped the utmost advantages from becoming acquainted with crafts other than their own. He himself had had the honour of acting as honorary secretary for about eighteen or more years, and he looked back on those years with the deepest pleasure. The subject for discussion that evening had been selected as being one of peculiar interest both to their guests and to themselves, and also as affording ground for a wide diversity of views.

The following papers were then presented on

The Practice of the Crafts in Modern Building.

MR. F. C. EDEN.

A few years ago we used to be told that the practice of the crafts was the whole duty of architects. Since then our mentors have moved with the times; and now engineering, "the noblest architectural result of the Renaissance," is said to be the one thing needful. The earlier theory was that the workman—craftsman they liked to call him: presumably in those days he must have used a folkwain instead of an omnibus to get to his job—that the workman was to be fancy free in manipulating his material, and by a flourish of his tools, as by a sort of peaceful picketing, to warn off the architect from ignorant interference with his self-expression.

Architects have usually been willing to learn—at any rate, up to a certain age—and though they could not agree to leave the carpenter and mason to work their own sweet will entirely untrammelled, they came to recognise that the touch of nature and nature's material is worth a deal of office drudgery; so that nowadays it might be hard to find one to show the fine impartiality attributed to one of the Gothic Revivalists, and mark his design for a reredos as being "for oak or alabaster." And now that we have gone so far with the critics they pounce upon us, dragging with them a new bogey dressed up as an engineer, and affirm that he is the only real artist, in whose mathematical formulæ the secret of true architecture lies hid. Give the carpenter a saw and a log, you need only wait to get a fine hammer-beam roof; just as the co-operation of mallet, marble and Michel Angelo once produced a *David*. That was the old arts and crafts theory; the new one is this: Provide an engineer with a book of tables and formulæ, and a thousand tons of steel cut to stock sizes, and the splendid practicality of the result is the only form of architectural beauty possible in the twentieth century.

The author must own to a scruple about subscribing to either of these theories. They seem to have originated in those uncomfortable shades where cranks and faddists do peep and mutter, and to take but small account, the one of things as they are and the other of things as they should be.

In any case, the result is to queer the pitch of the poor architect. He may still, perhaps, have his use if he keeps abreast of the latest inventions whereby civilised man hopes

to become daily a more and more comfortable animal, and if he be clever and unscrupulous enough to build a box for £150 to keep the uncivilised in. Whatever theories may be afloat, it seems absurd to suppose that fine architecture can exist without right practice of the crafts, even the humblest of them.

For example, the reason why the earlier works of that great master who has been lately taken from us do not give us the pleasure which we feel they should is surely this: That at the time they were built the right sort of brick and tile was not to be got. This trade (of the brick and tile maker) is perhaps the one in which the most real improvement has taken place, chiefly by the substitution of hand work for machinery, while carpentry continues to deteriorate owing to the increasing use of machinery in the trade. Where could one have an oak roof-truss, for example, properly made and framed in London without machinery and without iron?

The condition of the trade of the house-painter can hardly be said to be satisfactory. The most we dare to expect from him is that he lay a sufficient number of coats of good lead paint, and match a sample tint with fair accuracy; that he work with neatness, and leave no smears on the window panes. Once the author had to import an Italian house-painter from Florence, a man who worked at what was presumably the usual rate for him, viz. 10d. an hour. One of the things he was set to do was to decorate in the Poccetti manner a large coved cornice broken into by lunettes. When he started upon the first section—there were about seventy spaces to be filled—he asked if they could be varied in order to avoid monotony. And then he set to work and made a different but balanced design for every compartment. His method was to rough out his design on the plaster with charcoal—a matter of about five minutes—and then paint it in without more ado.

The designs might not have always been in the purest taste—the Italian, like other workmen, has become vulgarised by the general trend which we call progress; but he still has a sort of mediæval facility, coupled with an innate sense of fitness, which the British house-painter has long ago lost.

He, as already said, can match a tint; but even there his method is all wrong. He will mix you a mess of paint, certainly, but why is the result so unpleasant when it is upon the wall? Simply because the only way to get a beautiful effect of colour is by a glaze which allows the under colour to strike through. If you come across a piece of eighteenth-century panelling which has escaped repainting—say, where a cupboard has been fixed across a recess—the chances are that you will find an example of this method. The French way is technically better than ours; the difference consists in the way the first coat is laid over the priming. For this the paint is made into a thickish paste with oil and driers without turpentine, and this is spread not with a brush but with a broad spatula and well pressed home. It takes about a fortnight to dry, and is followed by three more coats laid in the usual way, the only difference being that the brushes used to have much longer and softer hair than ours. Stippling is not used, and the finished surface is very silky and pleasant.

For decorative objects, such as frames, reredoses, images and screens for churches, and so forth, the following is an excellent process: Lay a gesso ground over the whole surface, whether wood or stone, and upon this two coats of colour ground in spirit and mixed with spirit varnish. Then a coat of spirit varnish only; and, finally, and this is most important, the glazing or toning coat of colour, wax and turpentine. This method has the advantage that the toning can be promptly removed in whole or in part when any modification or correction is required by a rag dipped in turps; and also that it produces with rubbing that semi-polished surface so sympathetic to sight and touch which wax alone can give. Tempera colour can be used over the gesso if preferred instead of the spirit medium, and can be burnished like gilding when a glossy surface is required.

Gilding is a thing of which you can scarcely have too much if it is done in the right way, or too little if it is done in the wrong. Oil gilding, our usual method, is at best a makeshift, but even here the English gilder goes astray. He is prone to lay his size much too thick, and lay the gilding gold leaf while it is still too soft and sticky. A gesso ground should always be used, not paint, still less bare wood; the effect of the grain grinning through being very crude and amateurish. The result of wrong methods is that the gold quickly loses its brilliancy, and turns to a shabby, dirty yellow. Where durability and richness of effect are aimed at, burnished gilding is the only way. The gesso ground is covered with a thin layer of bole; this is wetted, the gold

leaf laid on it, and burnished when dry. If the result is too bright and metallic for the purpose in hand, the glitter can always be subdued by use of the wax toning recommended above.

Reverting for one moment to the relationship of the crafts to architecture, a recent text-book says: "We are always agonising about design, but design, as Rodin has said, is as nothing compared to workmanship." One is not surprised at Rodin disparaging design, but only that an architect should quote his words with approval. The whole misconception of the position could not be better expressed. It is our old friend the fallacy of false opposition. The crafts are the ingredients of which architecture is compounded. Design is to a building what the cook is to a dinner. If the fish be stale it does not matter how nicely it is served, just as the choicest of ingredients will be spoilt by unskilful cooking. Each is necessary as the other to the success of the result, and each is helpless without the co-operation of the other.

MR. F. W. TROUP.

"The Crafts" referred to in the title presumably mean what is often called the *artistic crafts* as distinguished from what are generally known as the *trades* connected with building. Every trade, however, is a craft, no matter how crudely commercial it appears at times to be. Indeed, one of the best examples of a modern craft is to be found in the practice of ferro-concrete. Although this seems to require the most abstruse calculation of its strains and stresses, and is usually regarded as an extreme example of the useful inroads of the engineer on the province of the architect, it is none the less absolutely dependent upon the most careful craftsmanship for its execution. Ferro-concrete appears to be the modern analogue of a typical mediæval craft. So much is it a true craft that many engineers fight shy of it, and declare that "they know where they are with steel pure and simple, but this mixture of steel and concrete is a hybrid of uncertain strength, and who can tell how long it will last?" Its devotees have to admit that it is a young craft, and there may still be about it some mysteries not fully gauged; but it must be remembered that even the arch in its early stages must have given masons a good deal of trouble before they got the hang of all its possibilities when properly harnessed, and its tricks if used without full knowledge and proper control.

One may here enter a protest against the assumption that there is no longer in these trades any true craftsmanship. On the contrary, there is an immense deal of traditional craftsmanship in all the ordinary building trades. The real trouble is that the modern workman attempts to hide all the best of it beneath a skin of geometric precision. Many architects, recognising this, have attempted to overcome it by using rough bricks, wide joints in masonry, and by other means in other materials have tried to get some semblance of the fling and go that seemed to come unsought in the work of the mediæval craftsman. But this is only a makeshift. Emanating from the architect, whatever its merits may be, it is more of an artificiality than it ought to be, or would be if it came direct from the craftsman himself. These devices of the earnest and conscientious architect are, however, not only easily imitated but easily exaggerated by those who do not always think for themselves and are inclined to overdo "the very latest thing out." Moreover, it is not a solution of the craft problem, although it may possibly point to and perhaps help in arriving at some cure more radical and permanent.

Whilst it is a little difficult to define in general terms the artistic crafts, it will be pretty generally accepted that carving, modelled plaster, decorative painting and stained glass all come under that head. Most of these crafts are, indeed, usually practised by men with a special training, but the materials are the same for the crafts as for the trades—the carver decorates the joiner's or carpenter's work, the modeller the plasterer's work, stained glass is only glorified glazing, and so on. So that we must recognise at once that the work done in what is known as the artistic crafts is no more than the ornamental part of the commonplace building trades.

It requires no very recondite reasoning to arrive at this somewhat obvious conclusion, but it appears as if it were forgotten by the craftsmen themselves. They too often dissociate themselves from "the trade" of their craft. They learn to carve, and forget to learn joinery; they learn to model, and know little or nothing of plain plasterwork. If the craftsman worked more with the artisans of the corresponding trade, regarded himself as a superior plasterer,

G. SANDERSON.
APR. 13. 1910.

bricklayer, or smith, and not merely the man to whom was apportioned the duty or privilege of doing the ornamental scraps and finishings, it would go some way towards overcoming the difficulties and dangers into which architects fall when they try to direct in detail the manner in which materials shall be finished in the buildings they have to superintend. The stone carver would be a mason rather than a sculptor. He would take cognisance of the mason-work further than merely to come on the scenes after the building was completed to carve and finish bosses and blocks marked on the architect's drawings as "left rough for carver." The modeller would have something to say, and knowledge from which to say it, with regard to the work of the plasterers generally. He would not, as now, merely deliver so many dozen beautiful casts whose exquisite modelling only makes the plain walls look silly by comparison. And, where the case required it, the trained tradesman, or artistic craftsman, would merely direct the general finish of the work without introducing any decoration or ornament whatever. The unattainable ideal is, of course, that he should be the foreman of that trade. His guidance of the workmen under him might, and should, then be a real training of the workman. Coming from a man versed in all the methods and traditions of the craft, his orders and directions would be different from and more effective than those of even the most able architect, whose directions are often regarded, and perhaps rejected, as whims and fads.

MR. CHRISTOPHER WHALL.

The subject is in two parts—with a trenchant division. "The Practice of the Crafts" is one, "Modern Building" is another. One may start with the challenging paradox that there is no practice of the crafts in modern building. To practice a craft you must first learn it—and to learn it to any purpose you must (or you almost must, for genius can override all rules) learn it as a child—when the mind is a *tabula rasa* and the spirit docile and obedient. To learn a craft the learner should begin as a small boy, an apprentice; and his school should be the workshop. One instantly thinks of a child with hair cropped by a barber's basin, a little dagger and wallet, and in doublet and hose. For apprenticeship went out with the unfortunate advent of trousers. The apprentice washed the brushes, ground the colour, and waxed up the glass on the easel, and so on, and in intervals was taught the elements of his craft. And so he by degrees learnt it, learnt all of it, with the sure prospect of becoming a journeyman, and some day a master.

It may be asked, Is there no such training now? In a sense there is, but in essence there is not, except in the workshops of those idealists who have set themselves to revive the crafts, as they have already revived that almost forgotten name.

In the ordinary shop where art wares are produced there are, indeed, boys who do all the kind of small services just spoken of. But when it comes to learning their craft, they only learn one particular portion of it. In stained glass, for instance, they only learn the painting, or they only learn the cutting, or the designing, or the cartooning. And they do not become, it is not intended that they should become—everything is arranged so that they shall not become—masters.

When architects go about to furnish and to decorate in detail their buildings what do they do? They go to some big emporium where such wares are sold. And they see the master. One could with great safety stake one's bottom dollar that that man has never been an apprentice or a

journeyman, and that if locked up in a room by himself with the tools and materials of his craft he could no more produce a specimen of it with his own hands and his own skill than Mr. Whiteley or Mr. Selfridge (supposing such persons exist) could make the things they sell. Indeed, if an architect wants a piece of architectural detail in wood or metal or stone or glass, he might almost as efficiently supply that want if he left the ordinary purveyor of such wares and adopted the advice so insistently thrust upon us all in the railway carriages, "Get it at —'s."

What, then, has been the personal training of those who in these days sway the destinies of the crafts of modern building? Why, Public School, College, Office, and a book and sketch book study of past styles—with a tour to look at the old examples, and notes how to imitate (without touching the tools or materials) work of the past which derives all that one admires from the intimate knowledge and diligent personal use of tools and materials.

The matter is really very simple. To learn the elements of any craft is the key to the right way of tackling all crafts, and the intelligent way of dealing with them and directing them.

It would be a good thing that the students of painting, carving, stained glass, &c., at the Royal College of Art should be required to pass through the architectural class, especially if part of the training took place in a stonemason's yard. But it is far less important for those who are already craftsmen to learn architecture in such a yard than it is for would-be architects to do so. A man already a craftsman in one material has the key to craftsmanship in general, and sees the whole situation from a right point of view; he may soak in as much theory and learning and history and knowledge of the past as he can possibly absorb. Architects, and especially learners of architecture, will do well to get a workshop practice of something. It can be done now for about half a crown a month in the splendidly equipped and splendidly taught technical schools in all parts of London.

MR. W. CURTIS GREEN.

Those who inspired the formation of the Art Workers' Guild (to whom I am proud to belong) have done architecture a good turn; they linked together architecture and the crafts, and have built up a body of craftsmen unsurpassed in their way. As a result of this re-union, English churches and houses are the standard of excellence throughout the world. We know that the practice of the crafts has hardly touched our cities, or reached the sources of production; it has not done so yet, and, when we look back at the last fifty years or examine the present, is it not too much to expect that it should in so short a time have reached so far?

We have explored the arts and crafts of the East and of the West, of antiquity and of the Middle Age. Not content with the fulness this knowledge of history brings, some of us become enslaved first by one period of artistic activity and then by another, looking, some of us, for salvation in the resurrection of the dead rather than in the quickening of our own spirits. At one time it is the convention of Greece, the clearly defined articulate art; at another it is the orderly and majestic attributes of Imperial Rome; again it is the romance and daring of the Byzantine school; then our hope lies in the Middle Age, first the Gothic and then the Italian, and later the French development.

Each fresh enthusiasm has had its distinguished exponents, and has achieved wonderfully fine work in building and the crafts. These individual achievements satisfy all the definitions of great art but one. Collectively they are evidence that the modern is no whit behind his forbears in architectural genius and in individual craftsmanship. In other words, the modern mind is as capable of conceiving noble buildings and of doing beautiful work as that of antiquity or of any age. To name only a few buildings of different phases: St. George's Hall, Liverpool; Old Newgate, Westminster Cathedral, St. Agnes, Kennington, are noble conceptions, as creditable to their authors as are the monuments of simpler times. Each in a sense is an example of a still living manner of expression; for every great period has contributed something that cannot die, yet of none can it be said that "this is vital," for none are in a language common to all.

We ask ourselves whether it is just now possible to find a language common to all. Anything added over and above the necessity of the case appeals either to the heart or the intellect; to both if it is a work of art. In the case of the mechanical art of the suburban villa and place of worship the appeal is to the untrained mind. When the intellect

comes in, whether in Classic, Gothic, or Modern work, art becomes conscious; indeed, it is only when it becomes so and recognises the necessity for discipline and control that it can ascend to any height. On the surface this confusion is not unlike that at the building of the Tower of Babel, but below there is necessity and a basis of unity which will result in another era of vital art.

In our wanderings, whether to Versailles, among American sky scrapers, or to Surrey farmhouses, we are, let us believe, doing useful service. Our admiration of the civic sense of the Parisians is drawing us to inquire into their methods and aims; our intellect calls for the exercise and discipline of orderly and stately schemes shown in beautiful drawings. Our interest in the great American school lets us into the secret that the applied method of design is not satisfying the western world. Our tours among old buildings have taught us the right use of material, and we have mastered the meaning and value of texture; our little experiments in the planning of pleasant urban dwelling-places have shown us that while all things may be lawful all things are not expedient. So that, besides producing individual instances of fine work, we have collected evidence which another generation will sift if we cannot.

Education consists in a series of enthusiasms, in a series of awakenings. Beginning with the architect and craftsman, may it not filter down through the trades and through the public? If education is only skin deep, so are shams. If the false ideals that have so nearly smothered the crafts have taken one hundred years to grow up, why should they not pass away in a like period of time? Prophecy is a cheap business if the prophet places the event sufficiently far away, but faith has firm foundations in the faithful. The craftsman knows that the attributes of his art are not transitory; they may be dimmed in times of prosperity or change, but if they are buried 3,000 years, like the corn in an Egyptian sarcophagus, they will spring to life again in a suitable environment. For a time the environment is unkindly, and the practice of architecture and the crafts calls for considerable qualities.

(To be concluded.)

ILLUSTRATIONS.

THE NEW NELSON HOSPITAL, WIMBLEDON.

THIS hospital consists of three distinct blocks, connected together by a corridor. Two of the blocks contain wards, the third being devoted to the kitchen offices and quarters for the resident staff. The centre block contains a ward for women for eight beds, with bathroom, ward kitchen, and sanitary offices, two single bed wards, one of which is intended for paying patients, and a clinical or testing-room. The long axis of the ward is, roughly, north-west by south-east, and at the southern end is an open verandah. The sanitary offices are placed in a projecting wing, with a cut-off lobby off the near or corridor end of the ward, thus leaving the whole of the ward free from projections which tend to impede light and ventilation. The bathroom, also, instead of being placed in a projecting wing, is put, as it should be, close to the large ward, and is readily accessible to the single wards. At the northern end of the central block is the operating room, and anaesthetic and sterilising room adjoining. The ward block for male patients contains a similar arrangement of wards and ward offices, with the addition of an entrance hall, committee-room, and receiving-room. The northern end of this block is carried up a storey higher, and contains a ward for eight children, ward kitchen, stores, w.c., and sluice-room.

The administrative block is two storeys in height, and contains, on the ground floor, the matron's quarters, consisting of sitting-room, bedroom and bathroom, nurses' sitting-room, and the kitchen offices. On the floor above are bedrooms for five nurses and four servants, with bathrooms, box-rooms, w.c.'s, &c. In a detached building are a mortuary, post-mortem-room and coal store. The hospital was designed by Mr. Francis Hatch, Lic.R.I.B.A., and carried out under the superintendence of Mr. R. Allsebrooke Hinds, F.R.I.B.A.

MODERN METHODS OF INDIRECT LIGHTING.*

(Concluded from last week.)

Dark Appearance of the Under Part of the Bowl in Indirect Fittings.—This is a very natural objection, and to those who are not used to the system it is one of the first points to be raised. It can be made much or little of, depending upon the point of view, but as a matter of fact the objection disappears with a trial use of the system. The fact is more noticeable for single-point installations; for example, one fitting in a room, in which case the bowl shows dark against the brighter ceiling. Where there are a number of points, however, and in the larger installations this feature is counteracted by the light from the other fittings. In any case, this effect can be largely reduced by employing a light-coloured or white bowl, and the lower part can even be made translucent if desired. In reality, practical experience shows this point to be one of minor importance, and one soon forgotten by those using this system.

Absence of Shadows; Flatness of Results.—This is a point of objection urged by many to indirect lighting systems, and is based on early experience with ineffective systems, such as cove-lighting. Illumination without any shadows is, of course, open to certain objections in producing a flat effect and unreal or confusing results. As we stated, however, earlier in the paper, the indirect lighting with the "eye-rest" system gives rise to soft shadows, so that this objection does not hold. The shadows exist, but are not so noticeable, owing to the complete diffusion of the light. It is quite a mistake to suppose that the system is "shadowless"; the shadows are there, but they are modified and reduced to an unobjectionable and harmless degree.

Coldness and Cheerlessness of the Light.—Such effects are not given with properly installed indirect lighting. It is possible, of course, to produce this effect by insufficiency of illumination through ineffective equipment in procuring the necessary volume of light upon the ceiling. As stated previously, the tinting of the walls can readily be employed to give any desired colour, tone, or warm effect in the resulting lighting. But in the main the objection arises through feeble illumination, and the same cheerlessness would be experienced with a similar illumination obtained by direct-light units above the line of vision.

Difficulty of Keeping the Fittings Clean.—The point has been made that the upturned fittings collect dust and dirt, which reduces the efficiency of the light by settling on the lamps and reflectors. This is valid criticism, but not a serious one. The system may require rather more attention to keep the lamps and reflectors clean than is required with some direct-lighting systems, but a test of cleaning costs in the case of Armour & Co.'s offices in Chicago was considerably in favour of this indirect system as compared to the direct systems. The item is at most a small one when we consider the superior results given by the indirect system, as the reflectors and lamps need only be dusted or wiped with a cloth about twice a month to keep them in good operating condition. It is hard to understand why there should be the objection to cleaning the fittings regularly when we consider that the furniture and fixtures of offices and homes are dusted on an average twenty to thirty times a month. Surely it cannot be much to ask and expect that lighting fixtures shall be dusted and cleaned twice a month.

Relative Cost of the Indirect System of Lighting.—The view that indirect lighting consumes an excessive amount of current compared with direct lighting systems has been discussed earlier in the paper. Like other criticisms, this arises largely from experience with the older and other more or less ineffective forms of indirect fittings.

Figures given in a paper by Wheeler (American Illuminating Engineering Society *Proceedings*, 1912) show for an indirect-lighting installation made in the village auditorium of Glenn Ellyn in U.S., the following results:—

Area of interior, 40 ft. by 60 ft.
Ceiling, 15 ft. high in centre, 12 ft. at sides.
Equipment, three eye-rest fittings, each containing seven 100-watt tungsten lamps, and suspended 5 ft. from ceiling.

* Abstract of a Paper by Mr. F. W. Willcox and Mr. H. O. Wheat. Presented at a meeting of the Illuminating Engineering Society, held at the House of the Royal Society of Arts, 18 John Street, Adelphi, on Tuesday, December 3.

Illuminometer readings made at thirty stations:—

Average foot-candles	4.20
Watts per square foot	0.87
Lumens per watt	4.83
Watts per lumen	0.207
Per cent. efficiency	56.

(Ratio total lumens generated to effective lumens.)

This excellent result was obtained with ceiling and walls of pure white putty coat plaster, and the floor of very light maple.

In a paper read by Lansingh and Rolph (Illuminating Engineering Society of U.S.A., *Proceedings*, 1908) an efficiency of 79 per cent. was stated for indirect lighting in a room with pure white ceiling, walls, and floor.

The writers have numbers of comparisons showing that the indirect-lighting system of installations effects material savings in many cases in energy consumption over the previous systems which the indirect system has displaced. These comparisons, covering all classes of installations in both large and small shops, office buildings, halls, theatres, &c., are most interesting evidences of the real gains in efficiency secured by this excellent system of lighting. In making comparisons between energy consumption of indirect lighting and other systems one must not fail to consider the fact that the indirect lighting effectually lights the whole interior, and not spots or parts of it, as is generally the case with direct lighting. Indirect lighting may cost more in many cases, but it does more. If the systems of direct lighting were compelled to give equally uniform and satisfactory lighting with the indirect they would also require a material increase in wattage.

The relative effects of direct and indirect lighting have been likened to watering a flower-bed by turning the hose into the air so that the water falls on to the bed in a gentle and well-diffused shower of scattered particles.

SOME FAVOURABLE EXPERIENCES OF INDIRECT LIGHTING.

Indirect lighting has been adopted in some of the largest lighting installations in the world. Careful and reliable tests were carried out by several large concerns in the United States in the past year, some of the investigations extending over a period of six months at the hands of a very competent investigating committee of engineers. The various systems of illumination were fully considered and thoroughly tried in each case, and the resultant decision was in favour of the "eye-rest" system of indirect lighting.

FIG. 1.—Concealed lighting in St. Mary's Church, Warwick, with tungsten lamps and metal reflectors attached to the east side of pillars and window recesses, showing the use of light to bring out the architectural features and beauties of the interior.

Such results render it desirable and interesting to inquire into the probable causes that contribute to such a marked preference for this system of lighting. We can consider these under two heads:—

1. *Considerations of a physiological and psychological nature which may be responsible for the preference for indirect lighting.*

2. *Practical merits and advantages of indirect lighting, which may explain the preference shown for it.*

Under the first heading may be included the following:—

Direct brilliant sources of light such as a lamp filament cause the eye to tire and weaken more than when the light is diffused. When bright sources are in the line of vision the eyes are constantly shifting about, seeking by movement to keep the light from being focussed with intensity on any one spot on the retina. Further, the discomfort from exposure of the eyes to bright sources causes the screwing up of the eyelids and puckering of the brow and the maintaining of the pupil of the eyes in a state of constant contraction, in order to exclude the excess light. The nervous energy so expended tends to produce brain-tire and drowsiness, while the fatigue induced by the constant muscular contraction makes itself manifest as discomfort in and about the eye.

In ordinary systems of lighting, such as direct systems, the sources of illumination are numerous, and as a rule many lights are included within the line of vision, so that the intrinsic brilliancy of each point of light impinges upon outer portions of the retina, and uses up the visual purple of the eye needlessly.

FIG. 2.—Indirect lighting in large office,* showing entire freedom from glare.

Side-light sources, within an angle of, say, 26 degrees cause rays of light other than those from the object focussed to enter the eye and use up the visual purple, with consequent loss of visual acuity.

In indirect lighting there is only one source of light—the ceiling—and therefore the rays are prevented from striking directly into the eye. In this respect the eye may be likened to a camera photographing an object with the sun in the field of the lens. This results, as everyone knows, in a fogged plate, and objects are indistinct unless they are highly illuminated. If this analogy holds, then when glare exists, as with ordinary systems of lighting, the intensity would have to be raised to produce the same acuity. Thus, of two systems of lighting, the one avoiding all glare, such as the indirect-lighting system, should require less intensity for equal visual acuity.

Dr. Percy W. Cobb (U.S.A.) points out that it has been shown that the eye loses sensitiveness by exposure to strong light, and conversely that in the dark the eye increases in sensitiveness.

Dr. Cobb, in discussing "glare," likens a light source in the field of vision to a loud noise, in that it distracts and tends to capture one's attention. There is a strong tendency to turn the eyes toward the light source, or it may be in some cases just the reverse—to get the eyes away from it. In any case the result is distraction and annoyance in trying to use the eyes on one's subject or work, and at the same time resist the tendency to look at the light source.

Another effect of glare already alluded to is physiological, and is seen in the extreme in the blinding effect produced by the light from a motor-car headlight being thrown in the eyes on a dark night. Again, it is explained in one's attempt to see past a brilliant arc light, to accomplish which one has to shade one's eyes from the brilliancy. The effect of glare in this feature is to reduce the ability of the eye to see clearly.

As glare is wholly eliminated in the indirect-lighting system, these effects, which fatigue and depress the visual function, cannot occur.

Cravath made tests on the effectiveness of light by direct and indirect systems by employing a number of observers to read thereunder and noting the degree of illumination considered in each case necessary for minimum comfortable results and for ample effect. His conclusions were that

with ordinary working conditions the diffuse character of the light falling on the work has more influence on the comfort of seeing and the amount of illumination required than the brightness of the surroundings.

Practical Merits and Advantages of the System of Indirect Lighting.

Has a large area of luminous surface (the ceiling or light-giving area), insuring a low intrinsic brilliancy of the luminous source, and a highly diffused character to the light. It therefore follows the diffuse lighting conditions of daylight in obtaining the working light from the largest possible surface.

One can sit in any part of a room and read with comfort, a condition not attained with other systems of lighting without employing a large number of outlets and points.

The source of light is high—the ceiling—with the result that, as the light is most excellently diffused and reflected to the lower part of the room, objects on the walls and in the room are clearly brought out. The reflected light from the objects (which causes them to be seen) is therefore not too intense, as is apt to be the case when the light sources are lower down in the field of vision.

One can assume a natural position in working or reading, just as in daylight. It is not necessary to sit in any definite position or facing any one direction or hold the book or work at any given angle. One sees satisfactorily in every position and direction.

The excellent diffusion of light prevents heavy shadows and sharp outlines, and avoids the very objectionable regular reflections from polished surfaces. It thus removes the glare produced from the glazed-paper surface of modern books and periodicals. One may protect one's eyes from exposed light sources by eye shades, &c., but the glare from glazed-paper surfaces caused with direct lighting is difficult, if not impossible, to avoid.

Permits adaptation of twentieth-century lamps and appliances to any form of architecture. As the actual light sources are concealed from view, there is no suggestion of incongruity of style or period. The daylight effect produced by the excellent diffusion of the light brings out all the forms and features of architectural design. It lights and sets off the ceiling, and has the desirable effect of raising the ceiling.

Avoids all possibility of any strong light sources in field of vision, and their discomfort and unhygienic effect to visual organs. Prevents images of the light sources from being reflected to the eye from surrounding objects. Avoids false shadows and high-lights, and similar distorting effects to decorative and structural features.

Analogous to the pleasing effect of theatre stage lighting, where all light sources are cut out of the direct field of vision, and the strongest possible light is thrown from concealed sources upon the stage or subject from the front.

FIG. 3.—Indirect lighting in picture gallery. (Note the absence of high lights on the pictures.)

Brings out the beauty of the architectural features of interiors, and reveals the details of structure and ornamentation of ceiling, arches, walls, columns, &c. This does what few lighting systems do—viz., it brings out the beauties of design of the interior, while at the same time it gives adequate illumination for the utilitarian needs of the occupants.

Gives close approach to daylight effects by skylight illumination, which, it is recognised, gives the most excellent illumination obtainable—the ideal of perfect lighting.

Requires fewer outlights than other systems for equal illuminating results. Perfectly adaptable to the majority of interiors without structural changes, and with a minimum

of alterations, the only conditions required being a light-coloured ceiling, either flat or arched.

Very easily and readily installed in place of existing fittings.

The bowl of fitting can be made to harmonise in ornamentation and colour with that of the ceiling or general interior. The bowls lend themselves to attractive effects of various kinds—e.g., as hanging baskets of ferns or flowers, thus concealing their real purpose. The fittings can therefore be made objects of beauty both by day and night.

Interesting and artistic special applications can be made, which dispense with having anything suspended from the ceiling—thus giving a clear ceiling—a feature that may be preferred in some cases. This result has been accomplished in the dining-room of the Congress Hotel, Chicago, by the use of marble pillars about 8 ft. high distributed about the room, each supporting an ornamental flower urn at top, in which the lights are concealed.

FIG. 4.—Indirect lighting in ballroom, showing effective and attractive results given.

In other cases the regular supporting pillars of the room have been fitted with a ring or circular shelf a few feet below the top, in which the lights are concealed and reflect to the ceiling. (This last application is, however, not productive of as good results as the standard plan of the "eye-rest" system, which requires an open bowl upturned to the ceiling.)

Satisfies most fully the real test of good illumination—namely, the ability of the eye not only to discern details distinctly, but to continue this visual effort for a good length of time with a minimum of eye strain and fatigue. Practical experience in office lighting has demonstrated a material increase of efficiency of the office force with the use of indirect illumination. After all, it is the eye, and not the illuminometer, which is the proper judge of what is the best and most satisfactory illumination.

That the indirect system meets the demands of the eye best is experimentally proven in hosts of cases of practical use of the system. It is the best proof of its supreme value and efficacy that it earns favour and adherents wherever it is tried. Those who live in England know the comfort of reading in the open on a cloudy day, a result due to the perfect diffusion which indirect lighting imitates.

The paper concluded with remarks showing the application and value of indirect lighting to the various classes of buildings and interiors.

Mr. Frank Baily, in opening the discussion, said that science, in the form of the tungsten lamp, had given a new instrument of torture into the hands of many users. It seemed a little inconsistent to have a paper of that sort read before experts and not before the users, viz. the general public, whom they wanted to educate. Another inconsistency was that such papers should be delivered in rooms where the worst forms of lighting had been installed.

Mr. Haydn Harrison thought that if the system recommended were generally adopted it would be a cause of self-congratulation to the supply companies. The figures supplied to them had all been based on rooms having light ceilings and walls. Considerably more energy would be required in the case of drab-coloured walls. From the point of view of health and eyesight the indirect system was certainly to be encouraged.

Professor W. C. Clinton remarked that an objection had been raised as to the absence of shadow, but he had found that a few sources of light, well selected, would give quite a sufficiency of it.

Mr. Charles Baker pointed out that walls and ceilings quickly lost their original brightness and lightness. In the

indirect system the distance of the light source from the ceiling was most important, as the difference of a few feet could have very great results. The type of ceiling put up in ferro-concrete buildings made indirect lighting rather more difficult. Both the supply authority and the fittings manufacturer would greatly benefit by indirect lighting. The consumer, he was afraid, would have to pay much more.

Mr. W. Mordey congratulated the authors on giving expression to the modern view as regards lighting interiors. But the system discussed was not as new as they seemed to think. A good many examples of it went back a number of years. The lighting of Sir Ernest Cassel's house in Park Lane was, perhaps, one of the earliest instances. What was required was "good seeing" rather than a high theoretical standard of illumination; one might see better with a bad light than with a good one if one saw with comfort. A harsh light was like a whip-lash over the eyes. Personally, he did not believe the indirect system would increase the electric light bill. He was of opinion that in many cases where the rooms were not high it was possible to get better light as regards "good seeing" without increase of expenditure.

Professor D. G. Louis was of opinion that the sources of light should be not too widely distributed if the best effects were to be obtained.

Mr. Campbell remarked that when architects heard of indirect lighting they only thought of cornice lighting. Excellent results were obtainable by the latter, provided that the ceiling above the cornice was the right shape.

Dr. Hickman contended that from an architectural point of view the indirect system was very excellent, but for general work it was unsatisfactory. For a theatre or place of that sort it did very well. There was in his mind, however, a feeling that the retina was occupied by the general illumination, and that a local light over one's left shoulder was required for working.

Mr. H. P. Trotter, the chairman, in closing the discussion, said he very well remembered seeing in an exhibition in 1881 a room illuminated by the indirect system. It had always been his impression that this was a very expensive mode of lighting. He had been astonished since to learn that there was not that expected loss. He held that in an office one required local lighting.

Mr. H. C. Wheat then briefly and satisfactorily replied to the points raised. On the question of increased cost, he remarked that with the indirect system fewer points of illumination were required. They did not claim that indirect lighting was a new discovery; the only new thing about their paper was its explanation of the "eye-rest" system.

THE DECORATION OF SMALL HOUSES.*

By ARTHUR SEYMOUR JENNINGS, F.I.B.D.

OF all the fields of active work in which the Incorporated Institute of British Decorators can employ the influence, talent, and experience of its members none, to my mind, equals in importance that of the decoration of small houses, by which I mean dwelling-places of moderate size, ranging from the modest country cottage to the kind of house which, in London, is of a rental value up to, say, £40 per annum.

I confidently make this assertion for several reasons. First, the field is of such vast magnitude; second, it has been almost wholly neglected; and, third, many of those who occupy small houses are earnestly seeking assistance in bettering their artistic surroundings. It is far from my intention to deprecate even in the smallest way the excellent work already accomplished by the Institute, the impetus it has given to the uplifting of decorative art in this country by the very practical method of offering travelling scholarships and in other ways. This work, it is to be hoped, will be continued and extended as circumstances permit until a stage is reached when our churches, public buildings, picture galleries, and theatres are decorated by our own countrymen in a manner which we can take pride in.

I have said that the small house has, from a decorative point of view, been neglected, and this is but the result of the condition of things as they exist to-day. Consider the case of a man who occupies a small house in the suburbs, which he has perhaps purchased through a Building Society, and the rental of which is from £30 to £40 a year. He and his wife are anxious to have their house decorated in good taste, but they have no actual knowledge whatever of the

* A Paper read before the Incorporated Institute of Decorators at the Painter-Stainers' Hall, London, E.C., on November 25.

subject. What can they do? Certainly they could put the work in the hands of an eminent firm of West End decorators, who would produce everything in the most perfect taste, but it would cost, or they think it would (which for our present purpose is exactly the same thing) far more than they can afford. Certainly they could pay a modest fee to an expert to work out a suitable scheme of decoration, but this is rarely done, and they would have a great difficulty in knowing where to apply for such assistance.

What does happen in ninety-nine out of a hundred cases is this. They obtain an estimate from a local "builder, plumber, and decorator," who duly supplies the estimate, accompanied with one or more pattern-books of wallpaper upon which they spend hours of anxious thought, although, if they but knew it, there are not in most cases a couple of dozen papers in it which are worthy of being hung in any home occupied by anyone having the slightest pretensions to good taste. Perhaps they decide to use washable water-paints, but in any case their selection is almost certain to be bad. In both cases they are groping in the dark, and, having before them the poorest patterns, must come to a decision practically without taking into consideration the all-important questions of furniture and of pictures, to say nothing of the dimensions of the room, its shape, its aspect, its windows, and the many other conditions which ought to be taken into account under such circumstances. Is it any great wonder, then, that so many small houses are badly decorated?

Now, there are in London many hundreds of thousands of such houses, and, including the country, a vast number in the aggregate, so that it will be acknowledged that there is plenty of work for the Institute to do if means can be found to carry it out on a practical basis.

I have three suggestions to offer. They are all applicable to the whole of the country, and, therefore, to the different branches of the Institute. They will entail a good deal of hard work on the part of Fellows, but I venture to suggest that this is rather a good feature than otherwise, because it is by hard and continuous work alone that any body of men can hope to fulfil its mission, and, speaking from a somewhat extensive experience of decorators in Association work, I believe that many members would be quite willing to serve on committees if they were reasonably certain that good results would accrue from their efforts.

My first suggestion relates to wallpapers, because these decorations, if properly designed and selected, possess so many advantages that they will in every probability continue to be popular for centuries to come. They are cheap, convenient, and, on the whole, sanitary. What influence can be brought to bear with the view of improving the design of all classes of paperhangings, especially those which, from their low prices, are certain to be used in our "small house"? What practical means can be taken to delete the bad designs, or, rather, to put a stop to their production? My answer is that it can be done by submitting the designs before the blocks are cut to a competent authority, which would only give their approval to those designs which in their opinion possessed the necessary artistic merit or came up to a sufficiently high standard, and I need not remind you that this would by no means necessarily imply an elaborated ornamentation or marked novelty.

Such an authority could, I suggest, be set up by the Institute by appointing from among its Fellows an Advisory Committee to pass designs which should from time to time be submitted. As is well known, public taste in decoration, as in other things, varies considerably in different parts of the country, so that it would probably be found desirable to appoint three such committees—one in London, another, say, in Yorkshire, and a third in Scotland.

It would doubtless be necessary, for the successful carrying out of this plan, to arrange with the manufacturers to pay certain fees for the professional advice thus given, and these fees might either be devoted to the important educational work of the Institute or be shared among the members of the Advisory Committee. Probably in practice it would be found desirable, while the plan was in its experimental stages, and the number of designs limited in number, to let the fees go to the Institute, and later, when it had proved a success, to make other arrangements.

Fortunately for the furtherance of this scheme, practically the whole of the wallpaper manufacturing industry in this country is in the hands of a single firm, and if they consented to submit some of their designs for approval in the manner indicated, and to pay a suitable fee, the rest would be comparatively easy. There are great advantages to the manufacturers in the plan suggested which needs to be em-

phasised. It is well known that out of every one hundred new patterns which are brought out year by year at least twenty, and often more, may be regarded as absolute failures. The cost of cutting the blocks and printing is precisely the same as though the paper had succeeded. Now, it is clear that the cost of these failures must be distributed over the cost of those which succeed, hence if the element of risk were lessened a considerable saving would be effected. I take it that at least a number of the members of the committee would be actual buyers of paperhanging, and if they had passed designs they would, when these designs came on to the market, no doubt stock them; hence their success would be assured. Then, again, those designs which were approved will be "hall-marked," so to speak, for the general trade, while those rejected would probably never be cut at all.

I am well aware that this scheme would take some years before it had a very marked influence on the wallpaper trade as a whole, but if it were started experimentally with, say, 100 designs to commence with, or even less, I believe it would become a permanent feature. The danger at first would be that only designs of expensive papers might be submitted, and efforts should be made to include also cheaper varieties. It is, as is well known, the custom to print successful designs of an expensive character in future years on cheaper papers, and this course would doubtless continue to be followed.

Those who doubt the practicability of my suggestion would do well to closely examine the method at present followed in choosing wallpaper designs—a method which I suggest is largely responsible for the poor decoration of the small house.

The manufacturer naturally produces the patterns which he thinks will sell best; in other words, he supplies the demand which he believes exists. In order to cater for all tastes he prints patterns, good, bad and indifferent. But the actual selection of patterns which are included in the "builder, plumber, and decorator" book to which I have already referred is not made by the manufacturer at all, but by the particular merchant or factor who supplies the books. This merchant selects those patterns which he believes will sell most readily, apparently forgetting that it is within his power, in conjunction with the manufacturer, to create a demand for the better class of designs by including them in his books.

The self-respecting tradesman of the better class only shows goods which he knows will give satisfaction, and rigidly excludes those of the very cheap and nasty variety. Why should not the wallpaper dealer act upon the same principle? Twenty years ago every wallpaper pattern-book of the cheaper class was made up of about one-third of the hideous patterns known as "mosaic sanitaries." To-day these are still used, but to a very limited extent. "Sanitaries," of course, are merely papers which are printed in oil colour instead of distemper, and are therefore washable. The process can be used just as well for a good design as it can for a very bad one, and this is proved by the fact that there are now excellent patterns to be had printed in oil colour, and it is significant that the word "sanitary" is being discontinued as applied to this class of paper, no doubt because of the association suggested by the atrocious designs of years ago.

I claim with all respect that the builders' merchant is not a competent authority to select wallpaper hangings, which requires the services of a trained decorator. The merchant probably deals in ranges, baths, ironwork, bricks, lime, and timber; in fact, everything which goes to make up a building. How, then, can he be expected to be a judge of wall decorations? It may be said that it is evident that his selection of papers sells, or he wouldn't continue; and this suggests a point which is often overlooked. A large majority of small houses (in London, for instance) are not owned by those who occupy them, but are rented from the owner, often on a three-yearly agreement. The landlord, as he is usually termed, in only too many cases gets his decorative repairs done as cheaply as possible, and the practice is to have a wallpaper pattern-book sent to the tenant from which to make a selection. Hence this tenant, if even he be capable of choosing well, is greatly hampered in getting a good result by the paucity of even moderately good designs. But he is forced to make his selection from that particular book, and the builders' merchant gets his order and imagines that the designs are quite as they should be. In making this sweeping condemnation of pattern-books I by no means include all merchants. There are in London alone a dozen or more whose business is to select designs of merit, but as things exist they sell mostly to the better class of customers. If the tenant were a free agent, and could choose his paper-

hangings where he wished, it would certainly lead to a great improvement generally. Even at the best I believe the merchants would be glad to have the advice and assistance of a jury of practical and trained men, such as would be provided by the formation of an Advisory Committee such as I have counselled.

I now come to my second suggestion, which, briefly stated, is that the Institute should offer to give through its Fellows for a suitable fee professional advice on all matters connected with decoration. Other professional men who accept commissions, including details of special work with which they are not very familiar, seek, as a matter of course, the assistance of brother professionals who have given it a close study. Thus the architect on occasion consults the engineer, and the general practitioner among medical men the specialist. If I am not mistaken, our highly esteemed President has acted as consulting-decorator on much important work.

But what I have at present in mind is the occupier of the small house who has refined tastes and who recognises the fact that he needs expert advice if he is to overcome the many difficulties which surround the subject and obtain that which he and his good wife so ardently desire, as artistic a home as his means and circumstances permit. Such a man would be very willing to pay a modest fee of a couple of guineas or so to a competent gentleman who would come down to see the house, the pictures, carpets and furniture, and on the spot make a selection of wall hangings or choose the colours for the painted work or for the walls of those rooms which were to be distempered, and leave the whole "cut and dried" to be carried out by the local house painter, who, having a safe guide all mapped out, could proceed without difficulty.

A half a day or a little more would be amply sufficient time in which to do such work, and at least some of the selections would answer in other places. A class of clients who would be very likely indeed to avail themselves of such assistance would be the speculative builder who puts up houses in rows from an architect's design, but who is often foolish enough to attend to the decoration himself, probably with the aid of some "job lots" of wallpaper he has purchased at a bargain. If he realised how very greatly a good scheme of decoration assists in attracting a tenant or customer—and many builders do realise this to an extent—he would be far from begrudging the few guineas it would cost him to obtain sound advice when he wanted it. When a member of the public wants the services of a reporter he applies to the Institute of Journalists; if an accountant, to the Incorporated Society of Accountants, and so on. If he wants professional advice on decoration, surely he should apply to the Incorporated Institute of British Decorators, if even the fee he is prepared to pay does only reach a modest sum.

Let us consider just a few of the little things he might do for the tenant of a small house, and a few of the things he might prevent. He could see that the plain-surfaced background—or one slightly broken up by a diaper or spotted design—had due consideration when there were good pictures if even they were intrinsically worth but little, and good etchings and coloured prints done by the three-colour process which gives such good results at so small an expense. He could see that the bedrooms were light and cheerful in design, that the hall, being practically bare of furniture, would have a bold design, with a reasonably large amount of ornamentation. He could insist on picture mouldings being used throughout the small house, even in the kitchen, and could in most rooms leave it perfectly plain, to be "put in"—that is, distempered—with the ceiling, and by doing this he would save his client not a little money and give him rooms finished in appearance. If "landscape" friezes were chosen, or those having prominent patterns, he could see that they were not mutilated and spoiled by being so badly hung that portions of the design would be carried around an angle. He would insist that every wallpaper design in a house was properly centred; if a stripe, then that the pattern was exactly equal on either side of the mantelpiece. In the small drawing and dining rooms there would be ample room for his expert knowledge. He might use the very narrow strap designs which are becoming so popular underneath the picture moulding and immediately above the skirting board in the Continental fashion, and he might, in addition, use the same straps vertically at the angles to produce panelled effects without actual panels. If a room were set apart for a nursery, and he chose a frieze likely to please the children, he would certainly see that it was not hung close to the ceiling in the ordinary way where they could never see it, but would probably place it about 5 feet from the floor line and fill in the space above with either a plain paper or a diaper. He could see that the kitchen was very light, and if the window

was small would use a varnished tile paper almost white, so as to help matters, for a dark kitchen is an abomination. If he recommended the much-abused enamel which, because of its durability is certain to long remain popular, he could arrange to have it not staring white, but give it a broken tint sufficient to accord with the prevailing colour of the room, and this he would do also in tinting his distemper for the ceiling and frieze. On the exterior he could probably do as effective service by using white for the sashes, and a bright varnish colour for the front door to brighten up a dingy front. Then, again, he could advise that white lead should not be used at all, at least in the interior, because of its very poisonous nature, but would recommend either a zinc oxide or a zinc sulphide paint in preference, particularly so as he would find it cheaper. In fact, there is practically no end to what he could do in even a few hours, and, once settled to the satisfaction of his client and himself, he might use a greater part of the scheme again and again in different houses situated at some distance. There are so many pitfalls into which the house owner who makes his own selections can fall that I hesitate to select from among them any which his adviser would warn him against. But there are a few which may be mentioned. For instance, pressed paper dado in a narrow hall, elaborate relief friezes, with its almost inevitably mutilated pattern, the crude and meaningless landscape friezes or borders, figures in relief on the door panels, gold on the wallpapers or woodwork—all these, as well as very many others which might be mentioned, are wholly unsuited to the small house. Repose and restfulness are the great desiderata in the decoration of such residences. The advisory or consulting decorator is more than a possibility—it is a crying want.

ART SCHOOLS.

I approach the third and concluding part of my subject with some diffidence, because I realise that there are many difficulties to overcome, not, however, that I believe them to be insurmountable. My suggestion here is that the Institute should endeavour to identify itself more closely with the art schools of the country, so far as decorative art is concerned, with a view of raising the standard of public taste, including that of the occupiers of small houses, and of producing more of practical utility than is the case to-day.

It will, I trust, be fully understood that I have no desire to make an attack on art schools generally; but I venture to assert that the actual practical results fall lamentably short of that which might be expected, and are far from being commensurate with the expenditure. Leaving out of the question the work done at South Kensington and at some of the art schools in the principal great cities, the instruction frequently given is, in my experience, only very partially directed toward practical ends, and the students are mostly young ladies who wish to fill in their time with a little fancy designing, a little dabbling in oil and water-colour painting. The men and women who wish to acquire knowledge by which they will earn their livelihood have but little to encourage them. I am well aware that in small art schools the funds available will not permit of the employment of a sufficiently large staff of instructors. I need hardly remind you that it is absolutely essential in teaching all branches of applied art that the instructor be practically acquainted with the industry in which the art is to be employed. Thus the teacher of design for metal work must be acquainted with the characteristics of the metals in which the designs are to be carried out. Indeed, it is not too much to say that he should have actually worked at the trade to some extent. In designing wallpapers it is clearly very necessary to take into consideration the question of repeat and many other practical matters relating to the printing of the papers. Many designs produced by art school students are useless because of this want of knowledge. Among some designs submitted to me some time since was one, the work of a young lady, in which some twelve colours had been used. A small pink dot occurred about twice in the design, and on my suggesting that this might be omitted without detracting from the value of the design as a whole, the young lady said, "I think it makes the pattern look a little better"; and it was only when it was pointed out that the insignificant dot would necessitate cutting a complete block to print it and would cost almost as much as though it played an important part in the design, that she realised its sheer wastefulness.

But there is another and more serious defect common in such designs which arises from much the same cause, viz. that the instructor is not a practical man, in this instance is not a practical decorator. This defect is that the designer is far too apt to make the pattern pretty in itself, apparently

forgetting that the small piece forms but a very little part of the surface of the wall on which it is to be used; in other words that the piece will look vastly different when it is repeated many times on a wall expanse measuring at least several yards in width and two in height. The only way, to my mind, to design a paperhanging is to draw the ornamentation for the whole wall of average size and then to cut out a portion of it, which may be used as the pattern. Details which may appear coarse in the piece will often look commendably bold in the mass, and details that are delicate and refined in the piece are not infrequently either lost altogether in the mass or have only the appearance of being weak and finiky.

To introduce into art schools a more practical plan of operations would be work well done. And I suggest that this Institute could do it through committees and on a similar plan to that followed by many of the Master Painters' Associations in connection with the teaching of painters' work. The conditions in the two classes may be said to be practically identical. In many of the painters' classes the instruction formerly given was not conducted on a commercial basis, so that even boys who were very successful in the classes were little or no good when they came into the workshop. A single example will indicate what I mean. Under the old system a lad was taught the importance of thoroughness in work, and very properly so, but so "thorough" did he often become that he would take as many days to finish a piece of work as it would hours in an ordinary workshop. His ability was, therefore, wasted.

What the master decorators have done, and are doing, in London, Leicester, Glasgow, and other places is to form a committee to act in conjunction with schools, and by arranging that at least one member shall attend on every evening when instruction is given who is in a position to make valuable suggestions (privately, of course) to the Principal and to the instructor as to the course the tuition should take. An occasional demonstration by an expert on some particular branch of the subject gives zest to the lessons, and forms a break which is usually looked forward to.

I see no reason why the same plan should not be followed in connection with decorative art. There might be a little prejudice as to "interference" to overcome at first, but ultimately I believe the assistance would be very welcome, for, after all, the Principals of art schools desire, as a rule, that the best results should follow their instructions; as matters are they rarely do so.

What is wanted is to do away with the idea which unfortunately prevails so largely among art teachers, that to put art on a commercial basis degrades it. It does nothing of the kind. It popularises it; it brings it within the reach of the masses, of the owner and occupier of the small house, and on that account, I earnestly believe, deserves the closest attention and the most active assistance which this Institute can give it.

"WHEN THE WORLD WAS YOUNG." BY MISS A. M. BOWERLEY, A.R.E.

THERE can be nothing but a chorus of approval in regard to this charming collection of Miss Amelia Bowerley's works in water-colour and etching at the Dowdeswell Galleries. A more delicate, fascinating ensemble it is hard to picture; and even though here and there our praise may be appreciably modified, it can never amount to dispraise or to anything approaching this.

It may be said in a phrase that the keynote of this artist's work is decorative effect, in some instances being sounded deeper than in others, but always dominant. The chord attuned on her highly lyrical instrument is of the most harmonious nature. Her children's faces are not, it is true, always as childishly pretty or even attractive as we might wish to see; yet the exceptions serve but to throw into greater prominence the many instances satisfying our child-loving nature.

Miss Bowerley dreams of the merfolk, and then, during her profitably employed hours of work, presents us with her charming visions of mermaids and water-babies. Regard, for examples, "The Depths of the Sea" (No. 8), replete with both grace and virility; "The Pool," showing a little merboy seated in a rocky cleft; and "Sleeping Water-babies," a vivid realisation of one of the artist's attractive dreams. "Flotsam," another of this series, is delightful in its portrayal of the sea and shallow beach; "When the Winds are all Asleep" and "A Sea-baby" are as rhythmic in etching as those previously mentioned are in water-colour.

"Snow-white and the Dwarfs" depicts the incident in the beloved child's tale, where the young girl is being borne along in the glass coffin by her companions, and is a work full of excellences. "June" shows a lady playing with a small girl seated upon her lap, the whole being embowered in delicately tinted pink roses; it is a work of the highest order of merit. "The Bathers," "The Storm," and "Low Tide" are good in their seascape treatment.

It is hopeless to essay individualising throughout, and we must conclude with references to three more of the etchings, "Goblin Market," "Dandelion Clocks," and "A Meeting," the first-named being one of the few without child-life, and the last-named depicting Love's young dream at a very tender age indeed.

"To some Love comes, whilst yet the years are few;
For youthful lovers spins a golden thread;
Who living, love; Love lasting till they're dead,
Till Heaven itself is brought within their view."

We have never seen a more refreshing display than this presented by Miss Bowerley.

FRENCH RENAISSANCE ARCHITECTURE.—IX.

THE ninth lecture of the course being delivered at University College, Gower Street, W.C., by Mr. W. H. Ward, M.A., A.R.I.B.A., dealt with "The Puristic and Classical Reaction and Archæological Design—the styles of Louis XVI. and the Empire."

The influences which went to the making of the so-called styles of Louis XV. and of Louis XVI., different as the results are from one another, were, pointed out Mr. Ward, in part the same. Both had their origin in a reaction against the absolutism and the artificiality of the age of Louis XIV. In both we may note a desire to return to simplicity and to nature, but different roads were taken to reach the desired goal. In the style of Louis XV. the Rococo school is prominent with its predilection for free flowing curves, its abandonment of symmetry, and also its use of nature motives for decoration. By the middle of the eighteenth century new ideas were afoot. There was a growing enlightenment of the middle classes and a growing discontent with the inequalities of the social system. The mordant sarcasms of Voltaire, and, still more, the Utopian doctrines of Jean Jacques Rousseau, paved the way to a change of front in the popular mind which had a direct bearing upon architecture. In addition to these intellectual influences, public fashion in art was affected by the writings of Lessing and Winckelmann, by the discovery of the buried cities of Herculaneum in 1719, and of Pompeii in 1748. Throughout the century, too, a number of people visited and measured ancient monuments in Southern Italy, Sicily, Greece, and the Levant. Greek architecture thus came for the first time under the notice of modern European architects. The discovery that the Vitruvian and Palladian systems had but small basis in fact brought about a revolution. At first contemporary work was merely purified from Barocco emphasis and reduplication, and from the vagaries of Rococo ornament and planning. Free flowing lines and rounded angles were discarded for the straight line and pure geometrical forms. The riot of curves of the Rococo came to be regarded askance as a fit expression of an age of profligacy, while the more rigid lines of the new manner symbolised a return to austerity and virtue as preached by Rousseau.

The first architect who adopted the new ideas was Jean Nicholas Servandoni, whose façade of the church of St. Sulpice created a sensation in 1733. Soon it was followed by Soufflot's rebuilding of the Hôtel-Dieu at Lyons, and then in Paris by the Fontaine de Grenelle, in which the sculptor Bouchardon carried the classical reaction still further. From this time it gained ground, though almost to the end of Louis XV.'s reign it ran concurrently with the older manner. About 1750 a powerful recruit was gained in Jacques Ange Gabriel, first architect to the King. Powerful lay supporters of the new style were Madame de Pompadour and her brother, who became Superintendent of the Royal Works.

Soufflot and Servandoni may be regarded as the originators of the new style. Its most representative architect, however, is Gabriel, who had a wide scope for the exhibition of his talents during the prolific second half of Louis XV.'s reign. At Fontainebleau and Versailles not much of his work exists. At Compiègne he was more fortunate in being able to carry out in its essentials the great scheme which he drew up in 1751. Two other fine works of Gabriel's are

among the principal ornaments of Paris—the Ecole Militaire and the Place de la Concorde. Perhaps his most consummate accomplishment, and certainly the most perfect example in France of domestic architecture of this period, was the Petit Trianon built by Louis XV. for Madame du Barry, and presented by Louis XVI. to Marie Antoinette. Here exquisite perfection of proportion and purity and refinement of detail invest an almost cubical block with extraordinary charm.

The style of Louis XVI. had not long won its victory over that of Louis XV. before signs of another change appeared on the horizon, more or less consequent on the general unrest of European society. The theory of the Rights of Man expressed itself in architecture in the right of architects to reject traditions of composition, and of every man to select his own models and methods. This break up resulted in that eclecticism which marked the architecture of the nineteenth century. At first it merely took the form of intensified archæological classicism. This may appear strange at first sight, said Mr. Ward, but it must be remembered that so much in the French Revolution was based on a reading, often a misreading, of Antiquity. Even before that era architecture had begun to take an excessively archæological trend.

Under Napoleon's rule there was a sort of aftermath of the last style of the old régime—though there is a distinct line of demarcation between the Louis XVI. and the Empire style. The former refined society was replaced by an aristocracy of parvenus, and the old architects and craftsmen had disappeared. That architecture and decoration were saved from a complete decadence is to a large extent the work of two artists of great talent, Percier and Fontaine. These two gathered up, so far as possible, the broken threads, and worked out a variant of the late style well suited to meet the taste of the age without pandering to its vulgarity. Empire decoration, for instance, had none of the soft and mellow graces of its predecessor; but in the hands of the best masters it is often extremely attractive, and has at least the merit attaching to any consistent and homogeneous style.

The Revolution led ultimately to the break-up of all classical traditions; and though the last of the classical styles in the direct line, that of the Empire, lingered on under the Restoration till about 1830, the heart was taken out of it by the fall of that Caesarism of which it was the reflection. It then found itself in conflict with a number of new influences. The romantic movement followed, and with it a host of revivals in architecture. Traditional design died down in the second period of the nineteenth century to so faint a flicker that there seemed a likelihood of its utter extinction. This did not occur, but since there has never been any style universally accepted throughout France since that of the Empire it may well be considered, said Mr. Ward in conclusion, as the last of those to which the Renaissance gave birth.

LONDON COUNTY COUNCIL AND PREVENTION OF FIRE RISK.

THE administration of the London Building Acts was again the subject of questions addressed to the Chairman of the Building Acts Committee at this week's meeting of the London County Council. As stated in the paragraph upon this subject in our last issue, the agitation has arisen out of the recent fire at the premises of Messrs. John Barker, Ltd., of Kensington.

Mr. C. Jesson (Walworth) asked if it was a fact that officials of the Council had from time to time suggested to the Building Acts Committee that greater progress could be made in the application of the requirements of Sections 9, 10, 11, and 12 of the Building Act, 1905, but that no encouragement or facilities were afforded them in the shape of extra staff? Was it the intention of the Committee to recommend that the staff should be strengthened, and had any effort been made to encourage building owners to make their own suggestions, and present their own plans to meet the requirements of Section 9, so that the Council might be saved large expense in the preparation of some of the surveys and plans? Mr. Jesson also asked whether many of the plans required by the Council, and for which surveys were made, could not often be obtained by courtesy from the building owners, and whether a large number were not in the archives of district surveyors, and could be borrowed by arrangement?

Mr. Andrew Taylor (Chairman of the Committee) replied that no suggestions had been made by officials in the direc-

tion indicated, but the Head of the Department annually reported progress under the various sections of the Building Act, and took the Committee's instructions. The question of strengthening the staff would be considered. Efforts had been made to encourage owners to present their own plans and suggestions, and it was possible to secure plans required by the Council by the courtesy of such owners. District surveyors, however, could not demand more than an inspection of plans, except in the case of public buildings. Since the majority of buildings coming under Section 9 were not public buildings, the plans were not retained, and, consequently, were not available.

Replying to a further question by Mr. Jesson, and supplementing the answer given in the Council last week, Mr. Taylor stated that seventy-three officials in the architect's department were engaged on means of escape questions only, and not in connection with the Building Act generally.

Replying to a question by Mr. Gautrey, Mr. Taylor stated that the Committee had obtained a report from the officers as to the areas and situation of land within the County of London now unbuilt upon, to which Part 2 of the Housing and Town Planning Act might be applied. The Committee had also considered preliminary details of areas which were ripe for development, and had instructed the officers to make further investigations with respect to particular areas. It was, however, undesirable at that stage to make public the Council's intentions.

FANS AND PANELS BY MR. GEORGE SHERINGHAM.

'Tis a fascinating little Exhibition, of a nature—or, more accurately, of a quality—that produces a sensation of desire for further display, contrasting thereby so pleasantly with the many Exhibitions which promote a feeling of satiety.

On entering the Ryder Gallery in Albemarle Street we feel at once in an atmosphere of high Art; nor is this sensation at all dissipated when detailed inspection is made of this small collection of fans and panels painted on silk by Mr. George Sheringham. The subjects are for the most part self-explanatory, another pleasant contrast to many works whose interpretation depends upon the title.

It may be conceded that to each member of the public there is a special note of appeal, now here, now there; but endeavouring to criticise quite impersonally we should select as of the best the "Golden Carp," the "Golden Peacock Panel," and "The Orange Panel"; and running these close in quality are "The Grey Harlequin," the "Emerald Panel," and "The Grey Parrot's Garden." There are two distinct schools of treatment observable—the palettes of brilliancy and delicacy, or, alternatively, the Oriental and the Occidental, the former represented by the Japanese and Chinese inspiration (and more particularly by the Japanese), the latter represented by English and French flavouring. There is quite the Watteau conception in "The Grey Parrot's Garden," "Fête Champêtre," "Yellow Garden," and "The Blue Tree." In "Romeo and Juliet" (the balcony scene) the black and white treatment is silhouette in effect, whilst "Victorian Panel" is essentially English. We can but end as we began—'tis a fascinating little Exhibition.

PORTRAITS BY MISS SCHEBSMAN.

CHARLES DICKENS has informed us in the pages of "Nicholas Nickleby" wherein lies the whole art of portraiture. "There are only two styles of portrait painting—the serious and the smirk; and we always use the serious for professional people (except actors sometimes), and the smirk for private ladies and gentlemen who don't care so much about looking clever." Miss Bettia Schebsman proceeds on different lines, if her small exhibition at No. 31 South Audley Street, W., may be taken as a criterion. Yes! Mr. Landon Ronald looks tolerably serious, and Mordkin and Miss Marie Lloyd smirk at us, but the private ladies and the children are sufficiently grave in countenance.

Miss Schebsman seems to have two palettes—the one more pleasantly bright and clean, the other dull and unattractive. Of the former, first place is taken by "Miss Marie Lloyd," which, in addition to the brightness, shows a well-balanced figure and a striking ensemble; the eyes are, however, too long—too continuous across the face. The artist's portrait of her sister, Mrs. Margolis, and her auto-portrait are clean and satisfactory. Her portraits give the general appearance of being good likenesses, an excellent quality

in portraiture; they steer a happy course between the ultra-realism of John Opie and the inartistic socialism of Miss La Creevy. The portrait of Master Albert Pozner shows a well-modelled head, but the gilt chair is too pronounced. "Miss Allinah Harper" would benefit if actuality permitted the introduction of carmine into the cheeks of the prettily-painted head, with the still more prettily-painted mouth.

Miss Schebsman's alternative palette is more apparent in "Sape Unikoff," "Mrs. Claude Montefiore," and "Miss Anne Millhoff"; the last two may be bracketed together also in regard to the supposed tapestry background of large rose design; the treatment is altogether too pronounced, nor in the absence of the tapestry effect do the roses appear to represent the blossom satisfactorily. "La Malagueinta" attracts the eye, even if the spirit cannot altogether approve; inter alia, emerald-green (as witness this and the previous canvas) is not a colour to be used in bulk, and, furthermore, we shall never approve "edging-in" the figures, except for decorative design. This is an artistic solecism, introduced (we believe) by Mr. Sant, R.A., and too numerous followed by Mesdames and Messieurs les brebis d'artistes.

LIBEL ACTION AGAINST AN ARCHITECT.

FURTHER litigation arising out of the work at Sefton Park, Lord Decies' country seat near Slough, came before Mr. Justice Pickford and a jury on Tuesday, when Mr. Horace Farquharson, of North Audley Street, the architect who acted for Lord Decies, was sued for alleged libel by Mr. Albert Edward Addis, a building surveyor, of Old Queen Street, Westminster. The statement complained of was contained in a letter written to Mr. F. H. Anderson, of York, solicitor to Lord Decies.

Mr. Lewis Thomas, K.C., for the plaintiff, said an outstanding claim for £6,000 was being made upon Lord Decies by the builders, Messrs. Holland, Hannen & Cubitts, Ltd., when the plaintiff was called in by Mr. Anderson and instructed to measure the work and examine the bills sent in. Plaintiff did so, and reported to Mr. Anderson that he had discovered discrepancies which would have resulted in Lord Decies being overcharged. Mr. Farquharson, the defendant, was requested to withhold his certificate for the payment of the balance, and, said counsel, evidently became angry at the imputation upon the figures by the plaintiff's investigations. On March 27 last he wrote the alleged libel to Mr. Anderson: "I enclose list of the points Mr. Addis raised. . . . In regard to all the other items Mr. Addis queries, they are due either to ignorance or misconception. . . . I think it most unfortunate that you should have called in a man who, having been in Cubitts' employ, left the firm not of his own wish, and I can only suggest this was inadvertence on your part. It would have been much better if you had gone to a firm of surveyors of recognised qualifications and position."

Counsel said it was not a fact that the plaintiff had been dismissed from Cubitts', in whose service he was from 1897 till 1900.

For the defence, which raised the plea of privilege, and denied malice, Mr. Clavell Salter, K.C., said the measurements in question had been made by competent men, and all the objections raised by the plaintiff, with the exception of two, were regarded by the defendant as frivolous. He (defendant) had to hold the balance fairly between all the parties, and, having regard to the position in which Lord Decies was being placed, Mr. Farquharson saw no reason for withholding his certificate from the builders for the final amount.

After hearing the evidence, the jury found the statements in the letter were defamatory, and awarded plaintiff £50 damages. Judgment was entered accordingly.

COMPETITION NEWS.

CARLISLE.—Eight sets of plans have been received for the proposed new school off Newtown Road. The competition was limited to local architects, and will be adjudicated by an assessor nominated by the President of the Royal Institute.

SALE.—The Urban District Council have decided to invite architects practising within a radius of ten miles of Manchester, who are desirous of competing in a scheme for the erection of public offices, to send in their names, with particulars of work carried out by them, from which list a selection would be made by the Council.

BOOKS RECEIVED.

"Common-sense Homes." A practical book for everybody upon the essential equipment and treatment of the home. By Spencer Gills, member of the Society of Engineers, the Royal Sanitary Institute, and the Institution of Municipal Engineers. With numerous illustrations. (London: Cassell & Co., Ltd. 5s. net.)

"Gardens for Small Country Houses." By Constance Jekyll and Lawrence Weaver. (London: *Country Life*; George Newnes, Ltd. 15s. net.)

"The English Fireplace." A history of the development of the chimney, chimney-piece, and fire-grate, with their accessories, from the earliest times to the beginning of the nineteenth century. By L. A. Shuffrey. Illustrated by 130 collotype plates from photographs, chiefly by W. Galsworthy Davie, with many other illustrations. (London: B. T. Batsford. 42s. net.)

"The Properties and Design of Reinforced Concrete." Instructions, authorised methods of calculation, experimental results and reports by the French Government Commissions on reinforced concrete. Translated and abridged by Nathaniel Martin, civil engineer, A.G.T.C., B.Sc., A.M.Inst.C.E., lecturer on reinforced concrete, Royal Technical College, Glasgow. (London: Constable & Co., Ltd. 8s. net.)

"The Note-book on Architecture." By Henry James Fox, A.M.C., national medallist and prizeman. (London: J. M. Dent & Sons, Ltd. 1s. net.)

"The Story of Architecture in Oxford Stone." By E. A. Greening Lamborn. (Oxford: The Clarendon Press. 3s. 6d. net.)

"Letchworth (Garden City) and Hitchin, with their Surroundings." A handbook for North-west Hertfordshire. By the late George Aylott and W. Percival Westell, F.L.S. With introduction by Ebenezer Howard. (London: The Homeland Association, Ltd.; Frederick Warne & Co. 2s. 6d. net.)

"Public Baths and Bathing-places." By E. Harding Payne, A.R.I.B.A., past president of the London Water Polo League and the Surrey County Water Polo Association. (London: Southern Counties Amateur Swimming Association. 6d.)

"Common Battery Telephony Simplified." By Walter Atkins, Engineering Department, G.P.O. (London: *The Electrician* Printing and Publishing Co., Ltd. 3s. net.)

"The Arbitration Clause in Engineering and Building Contracts. Suggested modifications in view of recent decisions." By E. J. Rimmer, A.M.Inst.C.E. (London: Constable & Co., Ltd. 2s. net.)

"Where to Live Round London (Southern Side)," with a chapter upon the geology and subsoils, by W. H. Shrubsole, F.G.S. Edited by Prescott Row and Arthur Henry Anderson. (London: The Homeland Association, Ltd. Frederick Warne & Co. 1s. net.)

THE Building Acts Committee of the London County Council report that the provision of £1,000 made in the annual maintenance votes in respect of fees payable to district surveyors for notifying or reporting to the Council cases of buildings coming within the fire-protection clauses of the London Building Acts (Amendment) Act, 1905, and cases of non-conformity with the provisions of that Act has proved to be insufficient. The expenditure involved in respect of these duties is one over which the Council has no actual control since the duties of district surveyors in the matter are statutory. It is estimated that additional expenditure of £1,250 may be necessitated during the current financial year.

STUDENTS' DRAWINGS AT THE ROYAL ACADEMY.

THIS not being a gold medal year, the prizes for architectural students at the Royal Academy are not of quite so much importance as a year ago, but the drawings exhibited are nevertheless interesting, as showing what is being done in what we may assume to be the premier school of architectural design in this country.

There are several points which ought to be borne in mind when forming an opinion or making a criticism on the work of young architects who are still students in the Royal Academy School.

In the first place the drawings are the product of evening work and, therefore, presumably of men who have already in some office done a day's work of a more or less utilitarian and, possibly, prosaic character. One cannot therefore expect the problem set in the school to be attacked with that freshness of mind and concentration of thought that should be present amongst students in day classes at the universities and the Architectural Association.

The actual working time spent each evening, after deducting from the rather short hours of the School the necessary waste in getting ready and packing up, does not allow of a very large amount of work being done at one sitting. As the problems set are usually what we may call monumental it is a long time before a design gets finished, and this probably accounts for what strikes us as being characteristic of the Royal Academy School—slovenly draughtsmanship and dirty paper, which it is the fashion to colour all over, since indiarubber and bread-crumbs would not effectually remove the grime of many weeks' labour.

There does not seem to be in the Academy School anything corresponding to the half-hour sketch, which is a feature of many educational systems in the art of painting, and we believe such a method would prove advantageous in the study of architectural design.

The aim of the School seems to be the development of completely thought-out designs, and when this is spread over a long period of time in many small doses, the paper naturally gets very dirty, hence the coloured background.

Another feature by which the Royal Academy School is distinguished from other centres of architectural training is that students appear to be allowed freedom and latitude, one might almost say license, in the conception of their designs and in the forms of detail by which they are accompanied. There is no evidence either of that characteristic *cachet* which is so prominent in other schools where architectural design is taught with presumably more dogmatic direction.

One might indeed say that in the Royal Academy School the young architect is not taught but helped to design. He is allowed to set up his own ideal, and is not expected or even encouraged to follow the traditions of the School, hence it will be found that the designs may be divided into two classes; those of the men who are content to follow where others have already shown the way, sometimes in composition but more often in detail, and those of the men who are striving to express ideas of their own in language of their own. The work of the latter it will be readily understood is far more interesting, notwithstanding that it inevitably embraces the largest proportion of failures, or at any rate want of complete success.

We notice in the case of several designs that both plans and elevations have been drawn, and presumably designed, over a series of squared lines, which suggests that there has been a determined effort at the introduction of a reasoned system of proportion as applied to present-day architecture rather than the hitherto prevalent reliance on a sense or feeling for proportion, which in the case of a young designer can hardly be expected to have attained such a degree of development as to be entirely reliable in the setting-out of a monumental building. Obviously with such a system of squares covering his blank paper the designer is led to plot his building in exact multiples of an uniform unit rather than a haphazard collection of more or less loosely related parts, and so gives a definite consideration to the proportions of the several components of his design, both in plan and elevation. We notice also that it is a common practice, at least amongst the more advanced students, to make a freehand perspective sketch in the corner of their sheet of paper, indicating that they are rightly being taught to think in three dimensions whilst they are working in planes of plan and elevation.

The principal prize of the year, the travelling studentship of £60, awarded for a design for "An entirely detached town residence for a nobleman in a capital city overlooking a public park on its west side," has been won by Mr. Oliver Frederick Savege, with a design which has more of the qualities of a residence than most of the other competitors have provided. These latter have apparently taken the view that the nobleman wanted a palace for gorgeous functions, and that his home would be somewhere in the country within a reasonable motor ride of the capital city, and they have accordingly planned with a view to spectacular effects and included magnificent halls, staircases, and salons. The winner has planned a house in which the nobleman could reside in comfort, and yet entertain with satisfaction both to himself and his guests. The elevations, if not wildly enthusing, are dignified and marked by sufficient rhythm to give a mild degree of interest to the composition, more particularly on the garden front. The entrance front rather suffers from the introduction of a *porte cochère*, which is a difficult adjunct to treat with dignity or in consonance with any attempt to design in the grand manner. The detail is not marked by originality but follows accepted precedent.

There appears to have been a mistake in the official printed list of prizes supplied to the Press and published by ourselves and our contemporaries last week. The prize and silver medal won by Mr. Charles Frederick Butt, according to the label on the wall, was for "An architectural design," and not for measured drawings of "The west front of St. Martin's-in-the-Fields, including the tower and one return bay." Mr. Butt's design was for an art gallery, and is one of those to which we have above alluded as designed over a series of squares. Mr. Butt has achieved an agreeable expression of proportion and has a good sense of detail, whilst his attempts at originality, if not completely successful, deserve commendation rather than reprobation. Another design (No. 142) for an art gallery, and so competitive with Mr. Butt's, is also an interesting example of a striving

for freshness in design. With a distinctively French feeling in composition, Sicilian-Greek Doric columns are found in the same elevation with Renaissance Ionic, and the conjunction is not altogether unpleasing, even if somewhat bizarre. The author of the design (No. 153) for a town church is also one of those who do not mean to be trammelled by an adherence to archaeological correctness of detail, and is feeling his way to originality, which, combined with the good feeling shown for proportion, promises well for his future productions.

Mr. W. H. Hamlyn's prize design for a loggia is on safer grounds, with a respectable observance of established canons of propriety, and so scores over such efforts as No. 169, whose curious dossier-entablature forming an impost to an elongated Doric column and unstilted arch, is more daring than pleasant. The designs for a domed memorial church for the most part rather allow the dome to overweight their composition, and their authors would do well, we think, to allow themselves to become imbued with the feeling of Bramante's S. Pietro in Montorio.

The measured drawings of "The west front of St. Martin's-in-the-Fields, including the tower and one return bay," by Mr. Augustus Gaffett Bryett (if the label on the wall is to be believed) are a fine set, delicately drawn and shaded. Mr. Bryett's successful architectural design with coloured decoration for "One bay of a hall for a City Company or Guild" admirably keeps up a harmonious *leit-motif* of colour through painted pictures and chromatic architecture. The perspective drawing in outline of "The east end of St. Martin's-in-the-Fields," by which Mr. Walker Llewellyn Clark wins a silver medal, is piquant by the sharpness of its visual angle, and is besides not entirely in pure outline, so that it is hard to believe that it portrays the same building as is delineated in a competitive representation.

IFFLEY CHURCH, OXFORD.

THE church exhibits some of the purest and most perfect specimens of Norman work still existing. It is supposed to have been erected either by Robert de Cheney, bishop of Lincoln, about 1140, or by Juliano de Remigio a little later. It consists of a chancel and nave, with massive embattled tower in the centre. The west front is of three stages, the lowest having a deeply recessed doorway with richly carved chevron and beak mouldings.

NOTES AND COMMENTS.

THE matter of the famous cup belonging to the church at Tong illustrates once more the urgent necessity for the protection of ancient monuments, which term includes other things besides those that are constructed of stone and brick and fixed to the soil. The parishioners of Tong are now applying for a faculty to enable them to sell their famous cup, and an offer from a "private source" of nearly £3,000 has been made for it. As the income of the living is only £110 a year, it is evident that £3,000 in cash would be more useful to the parish than the cup, which to Tong is a decided white elephant. It is not quite certain what the cup is, as one expert opinion designates it as a ciborium and probably the work of Holbein, whilst another declares that it has not been made for use in the church but was a domestic standing cup, and by the same hand as another cup in the Victoria and Albert Museum which bears the London hall-mark of the year 1611.

The Dean and Chapter of St. Paul's, with the assistance of the Surveyor to the fabric, Mr. Mervyn Macartney, have rightly again called public attention to the presumptive damage that may ensue to the Cathedral from the proposed tramway on the eastern side, and we are glad to know that the London County Council have so far departed from their previous attitude as to propose a conference between representatives of the Dean and Chapter and of the Parliamentary and Highways Committees. This conference was held on Tuesday last, when

Canon Alexander and Mr. Mervyn Macartney met Mr. Philip E. Pilditch and Mr. W. J. Squires, and the following statement has been issued by the Council:—

"A conference was held to-day between representatives of the Dean and Chapter of St. Paul's Cathedral and representatives of the Parliamentary and Highways Committees of the London County Council on the subject of the proposed tramway subway.

"The matter will be considered by the Parliamentary Committee early after the Christmas recess, and will come before the Council in due course. The Council's Tramways and Improvements Bill of 1913, which includes the proposal for the construction of the subway, cannot come before Parliament until February or March, and will not reach the Committee stage in the House of Commons until a later date, probably in April. The matter does not call for immediate action, and in any case it will be considered by the Council in January, when all the circumstances will be fully reported."

The stability of St. Paul's Cathedral is of too great consequence to the nation for any risks to be taken. The advisers of the County Council may be too confident, the advisers of the Dean and Chapter may be too apprehensive, although we do not think so, and it is therefore highly desirable that, if it be in any way possible, both parties by conference may arrive at the same conclusion—whether there is or is not the slightest risk. Tramways are not such unmixed blessings and so indispensably necessary to the community as to justify any risk being run with regard to so important a national monument as St. Paul's Cathedral.

The purchase of the Jeffrey's Almshouses by the London County Council has naturally been followed by the question as to what ought to be done with buildings erected in 1715, and possessing many of the best characteristics of eighteenth-century architectural work, and the proposal made by the Local Government Committee of the Council that they should be used as a local museum for the local craft of furniture and cabinet-making is one that is marked by much sound common sense.

A museum fulfils several distinct functions; it is first a depository and storehouse for valuables and curiosities, and as such offers justification for great national institutions such as the British Museum and the Victoria and Albert Museum, but a museum should be more than this. It should be the centre of instruction, inasmuch as we are all nowadays more or less specialists, and, as such, have some particular branch of knowledge with which we desire to become as familiar as possible.

It is obvious that when certain crafts are congregated in defined areas, as is the case with many industries in London, the principle of special industrial museums at suitable centres is the right one upon which to act. Shoreditch and Bethnal Green is the head centre of furniture and cabinet-making in London, and it is right therefore that the eighteenth-century ancient monument in Shoreditch which has become public property should be used as a museum for the local industry.

The problem of rural housing has, so it is said, been given careful consideration by the Rural Housing Association, and this body has issued a memorandum expressing an adverse opinion to the scheme of State grants for providing houses for the rural population. In this they say the Housing Act of 1909 has not yet been three years in operation, while the orders and regulations issued under it have been in the hands of the rural sanitary authorities for a still shorter period, yet already a great advance in building activity is shown. This activity is constantly increasing, and is likely to become still more marked when the councils which were not among the first to build begin to reap the benefit of the experience of the pioneers. A memorandum issued in November 1912 by the Local Government Board shows that in the time—barely three years—since the Act of 1909 came into operation, loans have been sanctioned to 29 rural district councils in respect of 46 parishes, for the purpose of the purchase of lands and the erection of cottages, as

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

against 11 rural district councils in the 19 years preceding, since the passing of the former Act of 1890. The amounts of these loans may also be contrasted. Those sanctioned since December 1909 amounted to £75,561, as compared with a total of £47,060 in the 19 years preceding. At the present time (November 1912) further applications have been submitted to the Board from 17 rural district councils to the amount of £55,000. In the opinion of the Association the Act should be given a much longer trial before pronouncing it to be inadequate.

The financial difficulty in the way of increasing the supply of country cottages arises in large measure from the inadequacy of the wages of the agricultural labourer, which in many districts do not admit of his paying an

economic rent. The policy of the State grant appears to the Association to be merely tampering with the symptoms, whilst leaving the real cause untouched. State-aided housing will do nothing to raise the standard of wages to a true economic level; it will rather tend to lower them.

On the other hand, the Association is of opinion that a continuation of the present policy of the Local Government Board of promoting the building of cottages by rural district councils at economic rents would, if pursued, have the contrary tendency—namely, that of forcing wages up in those districts where they were too low to admit of such a rent being paid. If the strictest economy compatible with adequate accommodation and

sound building were practised in erecting these cottages the rent might often be kept reasonably low; and if, at the same time, a piece of garden ground were provided with the cottage, large enough for its produce to be of material value to the labourer, he might be in a position to meet the increased rent with only a moderate rise of wages.

We sympathise with the views of Mr. H. F. Traylen, A.R.I.B.A., who, in a lecture before the Sheffield Society of Architects and Surveyors on the subject of Barnack Church, made a vigorous protest against the "flaying alive" of English churches by the removal of ancient plaster in the early days of the nineteenth century Gothic revival, when it was thought to be the correct thing to clear away all plaster and whitewash and to point the interior of our village churches with black mortar joints. The enthusiasts of the time failed to recognise that the plaster was in many cases contemporary with the masonry and intended by the first builders as a natural completion given to their rubble stonework.

Professor Selwyn Image has emphasised to his students the importance of thoroughness in technique and craftsmanship, and pointed out the marked difference between the half-hearted practice of some amateurs and the devoted application of those who give long time and service to the mystery of the craft they take up. He said it had, unfortunately, come about that a great number of people with a certain capacity for arts and crafts had set themselves to dabble in them—sometimes charmingly, yet still to dabble—without having the patience and modesty to learn the practical business of them. Then other people, without perhaps much, or any, sense of art in them, but with unquestionably a great deal of practical skill in certain kinds of crafts, had come along and smiled or scoffed. "Very pretty, very well-meaning," they said; "but look, my friends, the fellow does not know his business as a craftsman. Really this would not pass in any decent trade workshop. It only makes pretence of passing with those who do not know by a catch-penny exterior."

NOTES ON BOOKS.

"The Land Union's Handbook on Provisional Valuations." Being general advice to owners of land and house property in dealing with valuations under the Finance (1909-10) Act, 1910, as amended by the Revenue Act, 1911, with statutes and forms. (Published by Vacher & Sons, Ltd.)

The original MS. for this handbook was prepared by Mr. Ernest Watson, F.S.I.—an assistant secretary of the Land Union—for private publication, but the Executive Committee of the Land Union, realising the importance of issuing to its members a practical guide to dealing with provisional valuations, thought it desirable to acquire the rights of publication, and to issue it, with considerable additional matter added by the Literature Committee, as a handbook, subject to revision by some members of the Legal Committee.

It is not intended as a technical legal handbook, nor can it take the place of professional advice on the complicated points of law raised by this new legislation. But it states as simply as possible the main features which property owners ought to understand, and the direction in which they should move if they desire to protect their interests. The subject matter of the Act is so novel and so complicated, and so many interpretations still remain to be decided in the Courts, that opinions now given may subsequently require modification. The Land Union claims to have a unique experience in advising its members on valuations and in contesting claims before the referees and the Courts. Professional men will also have to have experience of this character, and this handbook should be of use to them.

The Finance Act, 1910, imposed altogether five new burdens upon land and house property (including in

the latter expression business and manufacturing premises of all kinds), viz., Increment Value Duty, Undeveloped Land Duty, Reversion Duty, Mineral Rights Duty, and Increment Value Duty on Minerals. A short description of each of these will be found in the chapters, with notes as to their incidence, the exemptions therefrom, and other points of interest.

Many provisional valuations are being sent in which are not based upon proper information. Yet if not objected to within 60 days they, however incorrect, will be fixed for ever. It seems, therefore, desirable to put in notice of objection whenever doubt exists as to the correctness of the figures wherever the owner's knowledge of law or fact is insufficient to enable him to arrive at an immediate decision.

It will undoubtedly be to his advantage to call in the aid of an experienced unofficial valuer with a good knowledge of the Act itself, without which knowledge the position of the valuer and client must resolve itself very much into one of "the blind leading the blind."

Owners should bear in mind that many of the most debateable points in the interpretation of very important sections of the Act are still unsettled and await the result of test cases before referees and the Courts of Law.

It is hard to see that anything is to be gained by being in any hurry to conclude a settlement. And if these considerations ought to weigh heavily with the minds of absolute owners, still more should they be remembered by trustees, executors, solicitors, and surveyors, acting for other parties. The position of those acting in any of these representative capacities is very delicate and difficult in view of the dangerous pitfalls which lurk in the Finance Act.

Rules for procedure in cases of appeal have been drawn up by the Reference Committee under the Act. These are necessarily somewhat technical and complicated, and in all cases where an owner decides to appeal to a referee and thence, if necessary, to the Courts, legal advice should be taken so that he may not prejudice his case, or be non-suited on account of any mistake or omission in procedure.

The Increment Value Duty is ostensibly a tax of 20 per cent. on any increase of value (not created by the owner) which accrues (after April 30, 1909) to the value of the site or any land (whether built on or not) over and above the original site value.

Owners should therefore be at great pains to see that the values fixed are the values as at April 30, 1909, and not the values at a time when prices are unduly depressed whether by political or investment conditions.

Another point which has lately come into unexpected prominence is the question whether what is called a "Minus Site Value" is legal.

The importance of checking all these valuations cannot be exaggerated, having regard to the fact that in all future cases of sale, the granting of leases, or underleases for more than fourteen years or on the death of the owner, an "Occasion for imposing Increment Value Duty will arise, whether the interest dealt with or passing is freehold or leasehold, a sale or lease of building land or of houses or business premises."

The question is frequently asked: Is it advantageous to the owner that his property should be valued high or low? A careful consideration of the Act and the purposes for which the "valuation" may be used, or can directly or indirectly be brought now or ultimately to bear on the owner's interests, convinces the Land Union of the continued soundness of the old adage that "Honesty is the best policy." For instance, the over-clever man may bethink him that a low total or market value may best suit him, having regard to his age and the increased Death Duties, but seeing that his death will be an "occasion" for the re-valuation of his property, not only for Estate Duty but also for Increment Value Duty, the Land Union consider that he should judge whether the studied depreciation of his property may

not result in a levy of 20 per cent. in the form of Increment Tax, while in no way lessening the amount of Death Duties imposed. This argument would not, of course, apply to purely agricultural estates, as such are free from Increment Value Duty, but would certainly apply to all other forms of business and residential property, and particularly to land having a potential building value. Even in the case of purely agricultural properties it must be borne in mind that land can now be compulsorily hired or purchased by County Councils for the purpose of small holdings, and that although the valuations are at present not available for use in connection with such matters, the time may come when these valuations will become common property.

All these and various other important and technical matters are thoroughly dealt with in this handbook, which is interesting reading and will give valuable assistance to anyone who has to consider the questions arising under this Statute.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday last, the 16th inst., at their premises in Conduit Street, W., Mr. Reginald Blomfield, president, in the chair.

It was announced that the Council, in the exercise of their discretionary powers, have admitted the South Australian Institute of Architects into alliance with the Royal Institute.

After some preliminary business, Mr. Horace Porter, M.A. Cantab, A.R.I.B.A., read a paper, which was fully illustrated by lantern slides, entitled:—

The Walls of Visby.

The island of Gotland is a low-lying plateau of limestone rock, some seventy miles long by thirty-five in breadth, in the middle of the Baltic Sea. The nearest land is Sweden, and with Sweden its history has been linked more or less closely from the ninth century. The island has been a part of the Swedish kingdom since 1645, and during the last two centuries the modern little town of Visby has come into being among the ruins of the past. Only a quarter of a century ago there were fields to be ploughed within the circuit of the city wall.

Of the thirteen or more churches which formerly stood within the city walls, one (the cathedral church of St. Mary) is still in use, and the ruins of nine others are ranged close together in the centre of the town, while along the ramparts thirty-eight towers and bartizans have survived out of the original tale of over fifty. Very striking is the impression which these towers produce as you approach the town. It is the Queen City of the Baltic that confronts you, the Visby of the thirteenth century, during which those ramparts grew up together with the fame that rose so rapidly and died down again so soon. The walls were not raised, in the beginning, as military fortifications round a military stronghold, but were designed first to assert, and later to safeguard, the power of a merchant city.

The fame of Gotland has become eclipsed by that of its one city, yet the island was an important centre of commerce long before the name of Visby had been heard. By the end of the tenth century Gotland had come to be the chief mart for all the important trade of Northern Europe with Russia, in the first place, and through Russia with the East. It was natural that the foreign merchants should desire some special protection for their valuable wares. The best anchorage for their ships they found on the west coast, under the shelter of the most famous "Vi," or place of sacrifice, of Gotland's heathen days, a rock platform close to the shore and raised some 100 feet above it.

As early as the twelfth century the merchants had special privileges granted them by the Emperor Lothair, and organised the first beginnings of the great Hanseatic League, in which Visby was for a while the leading city. In the thirteenth century this "Venice of the North" reached the zenith of its wealth and power. To it belongs the history of the Visby ramparts, which may be divided, for convenience, into three periods, coinciding more or less with the beginning, the middle, and the end of the century.

I.—FIRST PERIOD.

By the end of the twelfth century it is evident that Visby has already reached a high degree of prosperity. Unfortunately, that prosperity meant loss to the rest of Gotland,

where no separate township had formerly been recognised. The island as a whole had been the unit of social life, and free trade had been practised in its fullest form, native and foreign merchants alike living and trading where they chose. But only those Gotlanders who were established at Visby were allowed to share in its life and privileges. The rest found their goods taxed and themselves shut out from its markets, as much by its exclusive laws as by the wall with which, at the beginning of the thirteenth century, the town was enclosed.

Only a wall of moderate height was built at first, varying from 15 to 18 feet. The masonry was squared, uncoursed rubble of local limestone, the lower part being built with very large stones. It was finished at the top with wide battlements, alternately plain and pierced with a loophole.

The line of this enclosing wall seems to have been determined by the ridge of rock running parallel with the shore whereof the "Vi" formed the southern extremity. It is built along the edge of this ridge, on the landward side, and down the slope to the sea at the north and south ends of the town. Along the sea-front it followed what seems to have been the old line of the shore for a distance given as 1,950 yards. The three landward sides are estimated at 2,400 yards, making a total circuit of 4,350 yards. A considerable portion of the south and west walls has disappeared, but the rest of the line remains standing, with only a few breaches.

Three buildings, at any rate, along the ramparts seem to have been in existence before the wall was marked out. These are the square, solid fortress, now known as the "Powder Tower," down by the sea; the so-called "Mint House," and a remarkable building between the east and south gates, evidently deserving of a worthier title than the "Tjårhof," or tar-factory, by which it is now distinguished. Six other buildings seem to have been erected together with that first city wall, and they are all ranged about the south-east end of the rock ridge, which formed the first focus of the town.

At the completion of this first period, then, we have the old merchant settlement developed into an independent and alien city, enclosed by a low wall, into which perhaps nine towers and other structures were either built or incorporated, chiefly round about the south-east plateau.

II.—SECOND PERIOD.

To the Gotlanders outside the pale of Visby the enclosing of the town was a bitter affront. In the year 1288 their hostility was organised into open warfare. Long before that date the rich burghers must have realised the possibility of an attack upon their usurping city. Accordingly, they set to work to fortify the most important positions along the wall at no very long time, probably, after its completion. This second period in the history of the ramparts may be placed, roughly, at about the middle of the thirteenth century, a time of great building activity within the city. Some fine church work belongs to this period, notably the greater part of the beautiful abbey church of St. Karin.

As already mentioned, the towers which seem to have been erected together with the wall stand round about the important south-east rock plateau, which seems to have been the original heart of the town; and it is interesting to note that the six which, from details in their construction, may be placed in the second period are ranged along the remaining section of the east wall. This would be the part upon which attention would next be concentrated for defence against an inland foe; and the two towers which give the impression of being the earliest built along this stretch occupy the two most commanding positions, at angles in the wall, at either end of a slightly projecting platform of rock, and are especially fortified.

The towers themselves are constructed on the plan adopted with the majority of those added later, as projections outside the rampart. They are open towards the town, and present, on the outside, a rectangular base up to the lower level of the battlements, or about 13 feet above the ground. Above that level the walls are carried up as five sides of an octagon, the change in form being effected by cutting off the external angles with *broaches* sloping sharply back against the diagonal faces. Each face is pierced with narrow embrasures, one above another, and access to the different levels, on the inside, was evidently obtained by means of wooden floors and ladders, the sockets for which can still be seen.

The growing anxiety for the safety of the town also found expression in the building of gateway towers over the east and north entrances.

III.—THIRD PERIOD.

The third, and in some respects the most interesting, stage of the rampart building comprises an immense amount of work done within a comparatively short space of time. Popular tradition places it in the last decade of the thirteenth century, after the open attack upon the town in 1288, when the peasant force was met by the better-armed burghers at some distance from Visby, and was routed with heavy loss.

The work done to the ramparts during this third period comprised the raising of the city wall and the addition of forty or more new towers of various types. They are all open on the inside, with the one exception of the north-west corner tower.

The most remarkable feature of this later work is the type of balcony tower, or bartizan, evolved in the raising of the ramparts. These "saddle" or "hanging" towers, as they are termed locally, are peculiar to Visby. They were added as further defences midway between the taller towers (i.e., from 120 to 140 feet distant from these, on either side), and must originally have been about twenty in number. But only eight now remain, the rest having fallen down—in most cases bringing the wall with them—owing to their unusual method of construction.

This is aptly described by their popular name of saddle-towers, their side walls being perched across and astride of the raised rampart for some six feet above the summit of this. They are carried about half-way down the wall on either side, and rest upon large stone corbels. Like the other towers, these "saddles" are open at the back, and the battlemented face is supported by a wide arch built against the rampart wall. The effect is extremely picturesque, but the strain on the wall seems to have been excessive. So far as one can judge, all those that have come down have fallen outside the wall, and their tendency to do this is shown by the fact that two of the remaining eight are buttressed up from the outside. Two of them fell in 1842 and 1866 respectively, making great breaches in the wall.

IV.—VISBY'S FALL.

The beginning of the fourteenth century found Visby at the zenith of its wealth and fame; the Queen City of the Baltic, guarded by its formidable circuit of rampart walls and towers. In appearance these would seem to defy all comers, and it is one of the ironies of Visby's history that they proved so useless when the robber King Valdemar of Denmark made his raid upon the treasure city in the year 1361.

The Swedish King Eric wrote twice to the Visby burghers warning them, but they seem to have reckoned themselves safe behind their splendid ramparts, and all active efforts to repel the invading army were left to the despised country folk. The Gotlanders had not lost their courage, and they mustered in force to meet King Valdemar when he landed on the island at some distance from Visby. They were utterly routed, but made another gallant attempt to stop his progress a little further on. Again they were defeated, but once more they gathered themselves together for a final stand on the broad plain overlooked by Visby's southern wall. The burghers, who must have witnessed the ensuing slaughter, made no attempt at holding the walls so elaborately prepared to stand a siege, but opened the south gate to admit the conqueror. King Valdemar's answering insult was to have a breach deliberately made in the wall for his entry, in token that he came by force of arms.

The robber king's sack of the town seems to have been as thorough as he could make it. Gold and silver from the merchants, and jewels from the churches (including the famous carbuncles from St. Nicolaus) were gathered together by his men in barrels-full, so the story goes; and when he took his departure, at the end of a month, he claimed the whole of Gotland as his own possession.

There was no lasting peace or prosperity after that for the merchant city. Denmark and Sweden fought repeatedly over so rich a prize, and their kings looked upon it as a mine of wealth to be drawn upon at need.

All through the fifteenth century Visby was gradually losing its position in the world of commerce. Fresh trade routes were being opened up, and Gotland was no longer the centre that it once had been. From being the leading city in the Hanseatic League it descended to being first only in one of three groups, and this distinction in turn was challenged by its rivals. The rising town of Lübeck, in particular, was resolute in its persistent attacks upon Visby's pre-eminence, and gained justification when the lords of Visby Castle began to plunder Lübeck vessels.

The Lübeckers took the law into their own hands and boldly attacked the city that had once been the glory of their merchant league. They landed to the north of the town and broke through the walls near the north-west gate, plundering, burning, and destroying houses and churches, and laying siege to the hated castle.

This time Visby had no power to rally, and when peace settled down once more it was the peace of extinction.

Visby Castle was later destroyed, and the stones used by one of the Swedish kings to make lime for his new palace; but the ramparts and most of the churches were left alone for rack and ruin to do their worst until recent times, when very intelligent care has been given to their preservation.

Mr. Axel Haig, in proposing the vote of thanks, said he was a native of Scotland, and in that capacity he could confirm every word which Mr. Porter had told them. He had known the place ever since he was a boy at school there, and he remembered how they used to hear at times terrifying noises which on the next morning proved to be caused by portions of the town wall falling. Even as boys they had been sorry at it happening, although they lacked the knowledge and sympathy they had now. In the seventeenth century King Charles XI. of Sweden wanted lime, and to obtain it he removed many of the stones of a picturesque and strong castle built by King Eric. At about the middle of the western wall a castle was built by a prince as a residence for use while in the district; but of this, unfortunately, only a portion of the walls is left in one of the burgher's houses. Some years ago he, the speaker, had made a picture called "Towing in the Prize," which represented a sea-robber bringing in to Visby Harbour a rich merchant vessel. Mr. Porter had taken them over nearly every yard of the walls; but he personally would like to hear the whole thing all over again.

Mr. Geoffrey Lucas told how when he first set eyes on Visby last July he was in a bed-less and hungry condition, and the walls certainly looked to him then like those of an enemy. He had been landed about 5.30 in the morning, and could not get accommodation in the hotel, so he had to wander about until 8 a.m., when he was told he could have a room. This he proceeded to do, finally coming to a nice hotel near the south end, where he was able to obtain refreshment and also to enter into conversation in English with two soldiers who had just come in from a botanising expedition. Really he had had no right to be on Gotland at all, as he was an R.I.B.A. student sent out to study modern work. Not only the walls, but the town itself is fascinating; it is laid out on a slope, its narrow streets have pantiled-roofed buildings, the blue sea lies just at the foot, and over all was, at the time of his visit, the blue sky and sunshine. The churches are most remarkable and interesting; they would certainly repay a good deal of careful study and reveal aspects of mediæval art with which we are not acquainted in this country. The walls themselves are, so to speak, amateurish, and convey the impression that they protected a rich mercantile city rather than as surrounding a fortified town. One does not find very great science, for instance, in the disposition of the towers compared with what is to be seen in the fortified cities, say, of France. The moat or ditch had not been mentioned by Mr. Porter, though it was an immense one. There could be no doubt that the inhabitants relied on this to keep invaders from reaching the bottom of the walls. One need not be surprised that Visby is the only large town on Gotland, because in Sweden itself the towns lack the importance they have in England, which has for its size nothing like the proportion of small land-owners. There was, he might add, a lot of charming and interesting mediæval work to be found in Sweden.

Professor Beresford Pite said he would like to venture to express the peculiar delight it was for them to see their dear old friend, Mr. Axel Haig, that evening. The Institute recognised in him a very distinguished Scandinavian. The subject dealt with by Mr. Porter was a very interesting one, though it was scarcely artistic—unless in a wide sense of that word. There was very little art about such walls if stripped of their few ornamental details round doors; they were all much of a muchness. Nevertheless, there existed a very great deal of fascination about them. For one thing, the visitor wants to know how the machine worked. Perhaps the most enlightening series of articles on this subject was that by Viollet-le-Duc, in his *Dictionnaire Raisonné*, which makes everything clear. Burges thoroughly understood the fascination of this class of building, and his extraordinary reconstruction of Cardiff Castle shows us

perhaps what Visby looked like when in fighting trim. Such fortifications were not much value architecturally; their main lesson was entirely in the directness and purposefulness of the whole thing. It meant wall and defence. In this country York was very interesting, as it was possible to walk round the whole of the top of the walls and form a fair idea of how it worked. Then he would like to remind Londoners that they had in their midst a living fortress, and one which was a very unusual example of a mediæval fortress being still used for the purpose for which it was erected a thousand years back. When he was working in a City office he used to go during luncheon-time and sketch on the walls of the Tower of London. There was one broad and general distinction between Continental fortified towns and our own, and it was that the former were independent and had to defend themselves against their neighbours as well as against a common enemy.

Mr. C. Fitzroy Doll remarked he had been reminded that it was just forty years since his voice had been heard in that building. What interested him about the walls of Visby was the things that had happened there. Within those walls was germinated and there grew up the Third Estate. It was to Visby the merchants went where they could be on an island and protect themselves against those hordes of robbers which existed throughout the whole of Germany, and especially in the North. In the church of St. Mary there was deposited the chest of the Hanseatic League. To the Teutonic mind, indeed, Visby was as great as Rome was to the Italian. The organisation which there started was stretched far and wide. There was not the slightest doubt that the whole of the municipal government of London emanated from that beginning. In the London Guildhall there were all the documents to show this. They even gave us our money and the word "sterling," which came from the family of the Esterlings. Another Hanseatic institution was the steelyard, which was conducted in London almost with the dignity of an Oxford or Cambridge College. He might confess that it had been the ambition of his life to find time to write something which would show the influence of the Hanseatic League, which was almost incredibly great. He wished some young man in the profession would go to some of these Hanseatic cities and study their buildings. They were the most picturesque towns imaginable; and it should appeal to every Englishman to see the country from which his forefathers came.

Mr. Reginald Blomfield, the chairman, in closing the discussion, remarked that though the old German towns were immensely interesting, he could not agree with the suggestion that students should go there to study art. In his opinion a student should go to the headquarters of Gothic or Classic architecture in order adequately to study it. As Professor Pite had pointed out, the subject of the study of the development of military fortification was extremely interesting. They had all listened to a most delightful paper.

The vote of thanks was then put to the meeting and carried by acclamation.

Mr. Porter having acknowledged the vote of thanks the meeting terminated.

FRENCH RENAISSANCE ARCHITECTURE.—X.

THE tenth and final lecture of the valuable course of lectures on "The Architecture of the Renaissance in France," which have been completed by Mr. W. H. Ward, M.A., A.R.I.B.A., at London University, Gower Street, W.C., was chiefly concerned with Classical church architecture.

In his earlier lectures Mr. Ward had pointed out the reasons which militated against the period under consideration being a great church building age. He also showed in some of the earlier lectures examples of church building in the sixteenth and early seventeenth centuries, in which Renaissance elements enter into the composition of the elevations, though the plan and structure cling to mediæval traditions. In his concluding lecture, he traced the course of development which took place from the adoption of purely or mainly Classical systems of planning and structure.

In the main, said Mr. Ward, the architects of Classical churches in France confined their attention to two types of plan, which may be designated the basilican and the radiate, both of which make their appearance in the middle of the sixteenth century and continue in use till the Revolution, after which no important examples of radiate plan occur. In addition to these two types there are some examples which do not strictly belong to either, but make a sort of compromise between the two.

The basilican plan consists of an elongated rectangular

nave, generally terminating in an apse. Aisles and transepts with subsidiary apses are also often included, and the plan generally forms some sort of Latin cross.

The radiate plan starts with a central space covered by a dome, and should, in its perfect form, have equal arms, and take the shape either of a Greek cross or of a regular geometrical figure, such as a circle or polygon. This, however, is rare, and we more often find the plan more or less truncated in one direction, or with one or more arms considerably extended, so that an approximation to the basilican plan is reached.

Again, we find examples of the basilican plan, in which a dome is included at the intersection.

Perhaps the earliest non-Gothic plan in France is seen in the Mausoleum chapel built by Diane de Poitiers about 1560 just outside the gates of her château of Anet. The façade is likewise the earliest example of a church front composed on definitely Classical lines.

After Henry IV. was established on the throne one of his measures for conciliating the Roman Church was the recall of the Jesuits, who set to work to build churches and colleges in many parts of France. They brought with them their own architects and their own type of church, which was based on that of their metropolitan church in Rome, the Gesù, designed by Vignola, with a front by Giacomo della Porta. The first complete example of the typical façade treatment is the very monumental one added by Salomon de Brosse, the architect of the Luxembourg, to the Gothic church of St. Gervais in Paris, which the Jesuit church of St. Louis in the Rue St. Antoine closely follows, though with more florid ornament.

One of the most beautiful specimens of church architecture under Louis XIV. is the chapel at Versailles, the fifth and final one built in the history of the palace. The usual type of private chapel in castle or château was a nave terminating in an apse, repeated on two storeys, the upper floor for the king or lord and his guests, the lower one for the servants. At Versailles Mansart adopted the same scheme, but made important alterations. He added an aisle, which runs round the apse, and threw the upper and lower naves into one.

Even in the first half of the sixteenth century some examples of domical design occur, carried out more or less in the style of Francis I., as, for instance, the chapel of All Saints in the cathedral of Toul, built about 1540. A few years later Philibert de l'Orme was experimenting with domical design. The Valois Mausoleum at St. Denis must have been an example of that ideal architecture which was the outcome of that desire for perfectly pure, perfectly regular and symmetrical forms, which was one of the principal aims of the Renaissance. It was designed by Primaticcio, and begun in 1570, but never completed. By 1719 it had become ruinous, and was pulled down by the Regent Orleans. The stone dome was covered by a timber one to give dignity externally, the first instance of such a use in France, where it afterwards became general.

The chapel of the Salpêtrière, an asylum for aged poor, built about 1660 by Liberal Bruand, the architect of the Invalides, is an extremely complete instance of radiate design expanding into a Greek cross. The central dome space, which is octagonal and 65 feet in diameter, is surrounded by four oblong arms, between which are four octagonal chapels.

Two of the noblest churches of the seventeenth century built in Paris, though very similar in the treatment of their façades, their interiors and domes, differ in their plans, which are both intermediate forms between the radiate and the basilican. They are both churches of institutions, the Sorbonne and the Val de Grace. At the Sorbonne the church was placed in the centre of the college, and was planned by Le Mercier in such a manner that the dome should be in the axis both of the façade and of the inner courts. It thus stands in the centre of the church, and the plan of the latter may be described as a Greek cross with two arms lengthened till it is almost basilican. An almost unique arrangement and not calculated to give the best effect internally, since the dome space cannot dominate the whole interior as in a radiate plan, nor be the climax as in the basilican. At the Val de Grace the dome rises from a square block, which, if complete, would have contained a circular dome space surrounded by four apses and with circular chapels in the angles. The western apse, however, was replaced by a basilican nave. Though the arrangement is not a perfect one, the effect is good, for the light and spacious dome space with its apses form a fine culmination to the dignified nave. The chief defect of the design in

both these churches is the very unsatisfactory manner in which the inner and outer domes are related to one another. In both cases the outer dome has to be raised so high in order to dominate the church roofs that it becomes a matter of difficulty to make the outer windows correspond with the inner, with the result that both are more or less of a sham.

The manner in which this difficulty was overcome in the last great church of the seventeenth century by Jules Hardouin Mansart is not the least of its merits. Indeed, the arrangements of the dome differentiate the Invalides Church from all its predecessors. The roofs of the arms and chapels being kept low, it was possible for the outer and inner domes to be at the same level, and for large windows to be provided in them. There was a third intermediate stone shell, almost the whole of which is visible through the wide oculus of the inner dome, and is purely decorative. This dome has points of similarity with the one great ecclesiastical edifice of the eighteenth century—the Pantheon. The later church has many undeniable beauties, much scholarship, and great dignity; but it is the forerunner of the break up of the long line of Renaissance styles in France. It is marked by the pushing of archæological classicism too far, by the abandonment of traditional methods of composition, and that frigidity which is one of the main characteristics of the art of David and Canova, and of so much of the architecture of the Empire.

The concluding part of Mr. Ward's lecture was devoted to a brief recapitulation of the main preceding ones illustrated by slides of buildings typical of each period.

LONDON COUNTY COUNCIL AND PREVENTION OF FIRE RISK.

THE inquiries concerning the administration of the London Building Acts were advanced a stage further at Tuesday's meeting of the L.C.C., when Mr. Jesson asked the Chairman of the Building Act Committee how many notifications had been presented to the Committee from district surveyors, and what had been the cost to the Council of those reports? How many of those notifications had not yet been acted upon, and for what reasons? Did the Chairman of the Committee dispute the figure given by the Council's architect, Mr. Riley, before the House of Commons on the General Powers Bill, 1912, that the Council had received from district surveyors notifications of 48,566 buildings that required attention under Sections 10 to 12 of the Building Act, 1905?

Mr. Andrew Taylor (Chairman of the Committee) replied that the number of notifications received from district surveyors was 55,326, for which £20,156 12s. 6d. had been paid. The Act of 1905 placed the burden upon the owners of carrying out the work, and did not provide for any preliminary action by the Council. The Committee, however, on March 5, 1906, decided to forward letters warning owners of property of their liability, and 24,907 such letters had been sent. In respect of 2,985 notifications no action was necessary. The form of letter decided upon in 1906 also invited owners to seek exemption, and of the 5,000 buildings, the owners of which had responded, 4,500 had been dealt with by requiring structural alterations or granting conditional exemption. Discretion was given to district surveyors to pass buildings which were in conformity with Sections 10 and 12. The action taken under this discretion and that of the Council had resulted in 6,286 such buildings being brought into conformity with the Act. The figure of 48,566 represented the number of notifications of nonconformity with Section 10 (projecting shops) and Section 12 (buildings requiring access to roof), which had been received from district surveyors.

Mr. Jesson supplemented his question by asking if communications had been received from various organisations who had members working in buildings not considered safe, urging the Council to get the buildings put into a proper state as quickly as possible?

Mr. Taylor replied in the affirmative, and added that the Committee was taking the whole matter into careful and serious consideration.

THE NEW COUNTY HALL.

The Establishment Committee reported that they were in a position to ask the Council to proceed with the erection of the superstructure of the new County Hall, and recommended that tenders be invited from selected firms.

Mr. St. John Morrow objected to tenders being obtained only from selected firms, on the ground that many firms perfectly competent to do the work would be excluded. If a

similar procedure had been adopted in connection with the designs for the building the accepted design of Mr. Ralph Knott could never have been submitted. He moved the reference back of the recommendation.

Mr. Howell Williams seconded. He believed, as a matter of fact, many London builders would object to tender at all for the new County Hall, but into the reasons for that he would not enter.

The motion to refer back was defeated, and an amendment providing that the joinery and stone work, except granite, should be prepared within a radius of 20 miles from Charing Cross, was accepted.

Mr. Salmon, Chairman of the Committee, stated that the selected list included 14 London firms and four country firms.

ILLUSTRATIONS.

SOUTH PORCH, CHURCH OF ST. ANDREW, BISHOP AUCKLAND, Co. DURHAM.

ST. ANDREW'S CHURCH, as it at present exists, is of one date, and may be ascribed to the early part of the thirteenth century. The porch, with parvise over it, is a most interesting feature of the church. It is covered by two bays of quadripartite vaulting, divided by a transverse vaulting arch, which springs from slender shafts placed against the side walls. These have moulded capitals and bases. The vaulting ribs spring from the same shafts and from corbels in the corners of the porch. The parvise is reached by a newel stair, which projects from the west side of the porch at its north end. This and another porch with parvise over are the only two which occur in the county of Durham. The drawing, by "Alpha," was submitted in the monthly competitions of *The Architect Students' Sketching and Measuring Club*, and was awarded a prize.

HOUSE AT MISSENDEN.

THE house is built on rising ground overlooking the valley, and sheltered on the north-east by a small wood. The walls are built in local multi-coloured bricks, and the roofs covered with brown tiles. The large sitting-room hall has an open pitchpine beamed ceiling and a tile and brick chimneypiece. There are four bedrooms on the first floor. Messrs. Geo. Biggs & Sons, of Great Kingshill, were the builders, and Mr. Ernest G. Theakston, Lic.R.I.B.A., the architect.

THREE CROWNS P.H., HIGH STREET, NORTH WOOLWICH.

THE days of the gin palace are now passed, and the future public-house will be a picturesque building of quiet design in as refined a manner as the surroundings will permit. The Three Crowns public-house, High Street, North Woolwich, having for structural reasons to be rebuilt, was used by Messrs. West's Brewery Co., Ltd., as an experiment on these lines, and their instructions to their architects, Messrs. Lovegrove & Papworth, were to design the new building so that it should suggest its waterside position, being somewhat similar to the old riverside licensed houses of the Dickens period, and at the same time be as unlike the usual "pub." as possible. The licensing justices evidently approved these instructions, as when passing the plans they laid particular stress on the necessity of following the perspective sketch reproduced, and the work is now about to be started.

The buildings are extensive, although the frontage is not great, and comprise a large billiard saloon in rear, while on the first floor will be large and small dining-rooms, with kitchens, servery, &c. These rooms are also designed so that they can be converted in a few minutes into a suite suitable for Masonic purposes.

The general contract has been let to Messrs. John Greenwood, Ltd., of Little Arthur Street, London Bridge, the steelwork to the Aston Construction Co., Ltd., the ironmongery and fittings to the Albion Iron Co., and the glazed terracotta facings to Messrs. Doulton. The whole of the joinery, including the shop front, will be in teak, as the Brewery Company finds the extra first cost is quickly reimbursed by there being no necessity to paint. The cost of the building is at the rate of 9d. per cubic foot.

CAMBRIDGE, *Sketch Aug 1912*

THE ARCHITECTURAL ASSOCIATION.

A COMBINED ordinary general meeting of the Architectural Association with the Art Workers' Guild was held on Monday, the 9th inst., at Tufton Street, Westminster, S.W., Mr. Gerald C. Horsley, President, in the chair.

Four papers which were reported in our issue of December 13, were then read by Mr. F. C. Eden, Mr. F. W. Troup, Mr. Christopher Whall, and Mr. W. Curtis Green on "The Practice of the Crafts in Modern Building."

Mr. E. P. Warren, Master of the Art Workers' Guild, in opening the discussion, remarked that perhaps it was the first occasion on which a combination meeting of that sort had taken place. They had always understood Mr. Gerald Horsley was the actual founder of the Guild, though in his preliminary remarks he had alluded to himself only as one of them. The question of the controlling of the crafts in a building was a complicated one. In his opinion, no architect was worthy of having control of subsidiary crafts unless he was keenly interested in them. It therefore became necessary for every student to interest himself, and study as far as possible the various crafts with which he might have to deal. Of course, the conditions under which architects have to work are becoming increasingly difficult and complicated. New types of building and new systems of construction were constantly arising. But they had, thank goodness, always some of the old traditional crafts, which must be conducted very much in the way they had always been conducted. One of those was the craft of the mason. In masonry they had still to deal with the cutting and shaping of the mass of stone; and if they could eliminate wherever possible the steam-saw, and rely upon the mason's hand tools, architects still could get, especially from country masons, work very much as it had been done in the last hundred or more years. That fact was to him a great comfort. In carpentry, of course, the output by steam machinery of miles of squared timber was now inevitable. They could not put back the hands of the clock. It was hopeless for architects to think that by the assimilation of ancient methods they could return to primitive results. They had got to accept the methods of the period in which they lived. But an architect in regulating the ultimate results of the contributory crafts which come under his hands could at least see that the unavoidable machine-made or run piece of material was applied in a place where it was fitted. The architect in dealing with the ornamental part of a building could very carefully select the men who were to do the work, and restrict those parts so that there will be funds enough to bestow upon their proper fulfilment. Having chosen the men, the architect should give them as much rope as he could. Those men ought to have had something of an architectural or building training. A carver might do something intrinsically delightful in itself, but which in conjunction with a building would not harmonise with it. Though there was very much lacking in the training of the craftsmen as to the appreciation of architecture, there was just as much lacking in an architect's appreciation of the crafts.

Mr. C. F. A. Voysey said the idea that was uppermost in his mind was that they needed to be possessed of some ethical feeling before they could express themselves in their materials in any way. A general ethical training was necessary as well as a technical one. It was no use teaching the crafts until they had taught what it was they wanted to express in them. Mere craft that expressed no emotion they were better without. The construction of floors with boards and joists hardly came under the name of crafts, though even there the presence of an ethical training might stimulate.

Mr. W. J. Tapper remarked that it seemed to him that in the sort of "packing-case" days in which they lived, and considering the enormous buildings which were put up, the whole present-day system was wrong. In Roman and mediæval and down to Georgian times the craftspeople were doing things in a more or less self-contained way. Now, if they thought of the huge city offices run up, it was impossible to conceive where the question of art entered at all. The work had to be done by a system of tenders to begin with. Competition of that sort could lead to the most dreadful results. Then they came to the question of money. If they looked at an old building it was impossible to think its owners studied the question of cost. Crafts could nowadays only be applied in a very small way. What was the use of talking about craftsmanship, say, in big municipal buildings? Where a contract has to be carried through in three months or so, and the whole thing is cut and dried, they could not expect anything very great.

Mr. W. J. Allcorn contended that a traditional builder working in the country produced work as good now as any of his predecessors.

Mr. G. Leonard Elkington pointed out that when they regarded the older buildings it was possible to detect in them a certain intimate relationship between the designer and the craftsman. He could not help thinking that architects were very much to blame for the existing divorce between those two. In the old days, when a man took a great interest in his work, he was able to design a feature entirely suited to its place in a building. Nowadays it seemed hopeless to expect such intelligence from the average workman. Architects have attempted to create "a corner" in design, and the workman has lost interest in his work. In one way he felt inclined to agree that there was a good deal to be said for the small builder, i.e. where the builder was really the head of things and could go to the job himself. He had in consequence rather an objection to firms under the limited liability clause where there was no "head" to be seen. If they, as architects, could encourage the small builder it would in its turn encourage the small builder to take apprentices. The problem was to make the workman again interested in his craft. When he did that, architects must allow him to take some share in the design.

Mr. H. M. Fletcher thought that it was becoming too much a catchword that they could not expect a workman to take an intelligent interest in his work. If they, as architects, talked to them and sought their advice, they would generally find a man had two or three alternative ways of doing a thing, and had a decided opinion about one of them. Personally, he believed it to be quite a good thing for architects to talk with the men. He was prejudiced against the crafts being regarded as ornament. There could be, for instance, a great deal of art in bricklaying. He had heard American architects were astonished by the knowledge and skill of the English bricklayers. Builders could be encouraged to take much more interest in their work, and made to feel proud of it at the end.

Mr. Napper said he would like those present to imagine what an old building had been like when it was first built. When a thing was broken they called it art. A good deal of what was done to-day might become artistic in that way. Could art be taught? Who had ever taught art? It was only possible to teach a craft, and that by men who had practised that craft for years. It was impossible to learn a craft in a school. Art was what men put into their work after they had been taught the craft. Again, it was not possible to make a man an architect, although they could give him all the knowledge necessary.

Mr. Halsey Ricardo contended that it was humanity which really came into art. With those things which are old it is not their age nor their imperfections which render them artistic; it is the human touch associated with them. It is when time and all its associations come into a building that it becomes artistic. In architecture you had the hopes and fears, the tragedy and comedy of a building; it sweated human blood. But they had to recognise that they lived in their own time. Old buildings and old methods might be charming, but they were not business. They had to consider many things, and among them the introduction of new methods of thought and work. Machinery had altered the whole world for them. For all practical purposes, the crafts had been relegated to and degenerated into the guise of luxuries. They still existed because they were pleasant and nice; their value lay in their individuality. An architect's business was to take precautions with such crafts as they had still got. Progress would come by the experiments of the younger men. The public did not always recognise the business side of things. All over London there are schools of art and technical schools, most of them largely maintained by the ratepayers' money. They taught their students up to a certain point, and then, just as they were prepared to do something, they were told to go. They got fellows, for instance, who were competent to wield a brush and to do it wonderfully well. Londoners had at the present moment the beginnings of a new county hall. One would have thought the right thing would be to sculpture, carve, and paint it by the workers of these various schools. The young men might be efficient if they only got the chance of doing something. If there was one important thing in education more than any other it was to take a man up to the point where he is able to do things, instead of stopping just short of that.

Mr. W. S. Frith insisted on the necessity for a personal association between the architect and the craftsman if their work was to form one harmonious whole. His belief was

If A agrees with B that, any dispute arising thereafter between them, it shall be decided by C, neither party can sue unless it be shown that C is dead or has refused to act. If A refuses to submit to C's decision, he can (in effect) be compelled to do so by the Court.

In actual practice the arbitration clause with which we have to deal to-day closely affects the engineer or surveyor who is employed by a local authority in connection with the execution of a contract. When disputes arise they are referred to that engineer or surveyor, and the contractor—not unnaturally from his point of view—sometimes tries to get away from the decision of the very man with whom he has been at issue. He brings matters to a head by ignoring the “agreement to refer.” This he does by commencing an action. The local authority then takes out a summons pursuant to Section 4 of the Arbitration Act, 1889, to stay the proceedings on the ground that there is no sufficient reason why the matter should not be referred in accordance with the submission.

IV.—THE ALLEGATION OF BIAS.

The question is, What will the Courts hold to be sufficient reason? It is obvious that bias clearly proved would be sufficient to justify the Court in refusing to allow a particular man to sit as arbitrator; but the question of bias is not easy when considered in relation to a man who was a servant of the employer when the contractor agreed to his name being inserted in the contract as arbitrator. *Ex hypothesi* such a man is obviously bound to his employer to some extent.

What, then, is sufficient bias in the legal sense?

The time has arrived for local authorities to reconsider the whole position.

In order to succeed because of alleged bias a probability, not a mere possibility of bias must be shown (*Eckersley v. Mersey Docks*, 1894, 2 Q.B., 667). The mere fact that the arbitrator is the servant of one of the parties is not sufficient to disqualify him; for this is a fact which must have been known when the contract was signed. In *Ives v. Willans*, 1894, 2 Ch., 478, referring to the arbitration clause, in which the contractors had bound themselves to abide by the decision of the engineer, Lindley, L.J., said: “How does it happen that a man will agree to be bound by such a very stringent provision? The explanation of it is to be found in two circumstances. First of all, competition for this kind of work is very keen, and contractors compete with each other; and, in the second place, it has been ascertained by long experience that engineers of the highest character may be trusted, and when a contractor enters into such a very stringent provision as this he knows the man he has to deal with.”

A distinction is to be drawn between circumstances known to exist at the time of the contract and those which

afterwards supervene. For instance, in a Scotch case, a firm of contractors who had undertaken to build a public building agreed with the town council that a particular gentleman should act as arbitrator in case of disputes. The gentleman subsequently became elected “dean of guild,” and thereby, *ex officio*, a town councillor. It was held that this disqualified him from acting as arbitrator (*Edinburgh Magistrates v. Lowrie*, 1903, 5 F., 711).

The case of *Belcher v. Roedean School*, 1901, 85 L.T., 469, shows that the Court will be reluctant to revoke a submission to arbitration on the ground of interest. In that case a contract provided that all disputes and differences arising on a building contract were referred to the decision of the architect appointed by the building owners. The builders issued a writ against the architect for fraud and misrepresentation, and took out a summons to revoke the submission to arbitration. The architect declined to admit the charges made against him. It was held that an application to revoke a submission to arbitration was one to be granted with great caution, and that the submission ought not to be revoked.

(To be concluded.)

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of “The Cathedrals and Churches of Northern Italy,” “The Cathedrals of England and Wales,” “London Churches, Ancient and Modern,” “The Cathedrals of Northern France,” &c.

IV.—FACADES.—DOORWAYS.—CAMPANILI.—DOMES.

(Continued from page 200.)

The three rows of open arcades set in the square high base have undoubtedly a good effect, particularly in distant views. Perhaps the most pleasing appearance presented by the Pistoja campanile is when caught at an angle from a little distance; in an uncertain light it assumes a circular form. The top was meant to be seen from afar—as a kind of castle in the air, and in this the architect succeeded. The columns of the open arcades, though well proportioned, are deficient in harmony; their lowest range is of the Ionic order, whilst the second row is a kind of debased Corinthian, and the highest a mixture of curious capitals in the revived Italian and Buddhist style, in which the shafts and capitals of columns are generally of different patterns.

Above the three galleries, which end in a roof, not only provided with those forked battlements that form so marked a feature of the Lucchese towers, but also with four small turrets for the guards, rises a storey also battlemented and turreted, out of which again grows a pyramid, flattened at the top to carry, on four columns, the belfry. This is capped with a spiral roof terminating in a

globe pierced with a spike. The structure above the storey crowning the three tiers of open arcades may be considered to have been a later addition, for it would be wrong to take Giovanni Pisano to task. The upper storey was undoubtedly intended for the belfry, and would have been more appropriate for that purpose.

The study of Classical literature and good taste had not brought its fruits in decorative art when this campanile at Pistoja received its addition. A proof of this is seen in the chequered wall ornamentation which fills the circular heads of the arches of the arcades, where savage square patterns, forming a number of ornamental puzzles, devoid of everything, and varying the design at random, are seen. Such vagaries should be studiously avoided, especially in the decoration of outer walls.

The upper part of this campanile appears to have been constructed of textile fabrics, and this is contrary to all the laws of correct ornamentation. Some decorators have defended this class of ornamentation on account of the fine effect obtained by it at a cheap rate. This, however, is untenable. The Italians inherited the bad taste of decorating their walls with mosaic and floor patterns from the Romans; they often sacrificed the architectural outlines of their buildings to this kind of decoration. They were always too pictorial in architecture, and, it may be added, even in sculpture.

The campanile of Sta Croce in Florence affords a very good illustration of a square spire or high roof set conformably on the tower, and connected with it by gables. When a square tower is covered with a four-sided spire in the ordinary way there is no need of gables to form a transition between the two parts of the design. Such a spire, having its sides parallel on plan to those of the tower, covers the latter completely, and there are no corners or spandrels left to want filling up. On spires of this sort, therefore, gables rarely occur. We meet with them, however, in the church at Echternach, near Aix-la-Chapelle, and there is another instance in the church steeple now under review.

At Sta Croce, where the design is peculiar in several ways, the belfry-stage is unusually light and open. It merely consists of four tall piers, rising from a square base, and brought over again into the square by Pointed arches con-

necting their capitals. Each Pointed arch is enclosed in a gable or canopy of steep pitch, and from the bottom of the gables springs the square spire. From this spire, a considerable way up, is corbelled out on all sides a sort of balcony, also square on plan, and above the balcony, standing on the truncated spire, there is an octagonal pinnacle, with a spirelet of its own. The gables here serve to break up and enrich the bare outline of the roofing pyramid, and they permit the belfry arches to rise a little higher than they otherwise could; but they have, after all, the look of appendages rather than of vital necessities. They are decorative rather than organic: one feels it would be easy to dispense with them; they lack that charm of the best architecture as well as of the best poetry, which Wordsworth called "inevitableness."

A most pretty and interesting Florentine campanile is that belonging to the church of the Badia, and featuring in some respects that of San Pietro at Perugia.

The Badia steeple is hexagonal in plan, with pilasters at the angles, the two highest stages being filled with good Pointed windows of two lights, and the whole crowned with a spire, at the base of which steep gables pierced with small quatrefoils rise on each side. The design of this somewhat minaret-like campanile is rather piquant, and were it not that Giotto copied nobody, might be assumed perhaps to afford some data for the addition of the spire to that archetype of Italian Pointed campanili; it is almost needless to say that of the Duomo.

This tower has been left to the last; for, undoubtedly, whatever insular pride we may feel as we compare it with our own, no one who has any eye at all for the beautiful in art can fail to acknowledge that all previous efforts of this kind have received their fitting crown in this work of Giotto's.

To describe a structure whose moderately just praise would seem, perhaps, hyperbolic to those who have never seen it, is dangerous; and though even the most exquisite drawing and the clearest photograph cannot convey a perfect idea of it to the eye, a description must needs fail more completely to do so. Nevertheless, with this apology an attempt must be made to describe its general features.

The materials are green, red, and white marble; the latter has become yellow by age, and all the tints are beautifully harmonised together throughout. Nor is it the colour only that is perfect, for a study of the several portions of the elevation shows that the whole was arranged in the most carefully graduated proportion; and two points worthy of notice are the distinct marking of the various stages by very pronounced string-courses and the softness of contour which the octagonal shafts at the angles confer upon the whole design. Whether the intended spire would have damaged the perfection of the work is a question that must be left to individual judgment; but no one nowadays would have the hardihood to think of attempting its addition any more than he would of altering the familiar aspect of the western towers of Wells or the central one of York. The injudiciousness of meddling with a familiar outline has been only too painfully illustrated at Chester, and in certain French and German towers left unfinished since the Middle Ages.

This campanile of Giotto, at whose progress Dante used to sit and gaze, must be classed as Gothic, but it wants nearly all the elements most essentially characteristic of true Gothic architecture.

There are no massive buttresses, none of that bold display of construction that forms so charming a feature in such steeples as Antwerp, Malines, Rouen, and St. Omer. The one feature that is consonant with true Gothic feeling in it is the bold machicolation of the cornice—bold in scale and proportion, though treated in ornamental detail with the utmost delicacy. For the rest, the Florence campanile is almost like goldsmiths' Gothic, so to speak. It is deficient in that element most necessary to architectural design—the appearance of monumental stability. It is, moreover, an architectural facing, not a real piece of building, a recollection which must always jar upon us in our contemplation of it.

Yet Giotto's campanile exercises, and always has exercised, an extraordinary fascination upon all who gaze upon it. Even those who condemn it on stern grounds of architectural truthfulness never dip their pens in gall; they cannot escape that spell which it throws around them. The truth of the matter is that, in spite of the objection we naturally feel to a merely veneered architecture, there is in the campanile of Florence a display of a highly-refined artistic taste and organisation. If it is not in a perfectly pure and homogeneous style; if it does not represent the best and most substantial mode of construction, it is a design in

which every portion is nicely weighed, and in which we perceive the application of Classical refinement applied to what in the main are Gothic details. The defects of its design, in addition to that inherent want of solid construction, are that the window tracery is somewhat clumsily treated in detail (but this only becomes apparent by a minute inspection), that the twisted columns springing from corbels are not strictly architectural in their relation to the whole, and have too much the appearance as if they were affixed for ornamental purposes, and that the tower had never reached completion. Of this latter fact few of those who admire it are aware, though the general consensus of opinion among amateurs is that it looks unfinished. Considering how almost universal is the completion of the straight-lined Italian campanile, with a lantern and a spirelet, it is surprising how blind even architects seem to be to this incomplete state of the campanile at Florence, even supposing that they are unacquainted with its history.

Giotto had intended to terminate the square by a pyramid, as in the campanile of St. Mark at Venice, but his successor, Taddeo Gaddi, was averse to that addition. There is a certain doubtfulness as to the actual authorship of the design, some of the Italian savants regarding Giotto's connection with it as a myth; but we do not find any doubt expressed that it was not intended to terminate in its present abrupt fashion. In fact, the carrying over of heavy machicolation with nothing further is a device proper rather to military towers than to such a piece of purely decorative architecture as this. It may be doubted, however, whether a heavy pyramidal roof would not rather overweight the delicate design of the substructure, so different from the nearly solid mass of such a tower as that in the Piazza San Marco at Venice. One would be inclined to prompt an octagonal spire of inconsiderable height, similar to those that crown the two graceful campanili at Viterbo, or that which so appropriately terminates Sta Anastasia's at Verona.

The manner in which the dome was introduced and adopted in Italy was so diverse in its causes and its results as to detail its history in any clear and consecutive order very perplexing. Its growth, however, may be traced all along the line, here developing and there decaying, from the time man first began to imitate the forms of natural construction.

The complete dome is at first nothing but a mound scooped out. But there are incomplete domes; those, for instance, which are only domical externally—such as the mound, cairn, or tope—and those which are domical internally, as are most of the mediæval domes. It is manifest at once to every archaeologist that to ceil domically and to roof domically are distinct operations, which may or may not be united in one and the same cupola.

The dome as first met with in masonry is no arched construction, but a series of horizontally-bedded overlapping rings, with their under-edges smoothed off, forming in section not a semicircular, but a Pointed arch. This method of corbelling, of course, has its limits, and is unsuited for buildings of large spans. It is seen in the rude early structures, commonly called beehive houses, as well as in the carefully-wrought tombs known as Etruscan. The wall openings of the same early period were often similarly built—namely, a series of plain corbels, with their projections smoothed off to a curve like an arch, or cut straight. This may not inappropriately be styled the corbel-dome. The second form of dome is that marked by the Pantheon at Rome, where the cupola is raised upon a circular or pentagonal substructure, and is constructed on the principle of the semicircular arch. The enormous weight of the haunches, the external design, and the general treatment show clearly enough that up to this time the architects' or artists' thoughts were wholly directed to the dome in the character of a ceiling, and not as an external or roof form. This may be called the arched drum dome.

Again we travel eastward, and find the third form. This we may call the pendentive dome. It is the mother of nearly all mediæval domes—of the huge yet elaborate pendentive of the Eastern mosque, as of the plain yet solemn cupola of Aquitaine. This contrivance for fitting the hemispherical to the quadrilateral was the really great invention connected with this important architectural feature.

The next step was to lift the dome and give it as much emphasis externally as it had received internally. The fourth phase, then, introduces us to the last development, which may, perhaps, be best described as the tower dome.

There were two distinct influences, both occasionally tending to the adoption of the dome in Italy. At Rome, and in places under its influence, such examples as the Pantheon

could not fail to have their effect upon the architecture, and we accordingly find these numerous scions of the provincial family, while the purely Byzantine forms were simultaneously introduced by way of Ravenna, and later on were planted at Venice. Through this twofold influence the dome became very frequent throughout Italy. It was carried by Charlemagne from St. Vitalis at Ravenna to Aix-la-Chapelle, and later on was imported from Lombardy—where we find beautiful examples at Parma, Piacenza, Pavia, Cremona, and Trent—under the first three Othos across the Alps, down the valley of the Rhine, and far into the interior of Germany.

Only a few years later it was conveyed from Venice into Western France, whence it spread through an extensive district stretching eastward into Auvergne, even as far as Lyons, and north-westwards to the banks of the Loire.

In that portion of Italy of which these pages treat we find several very graceful applications of the dome, notably in the Baptistery of the cathedral of Pisa, and in that of Siena, and when, later on, the great domed creations of Brunelleschi and Michel Angelo had set the fashion, hardly a church was hereafter built in the peninsula in which the dome did not constitute the leading feature in the design.

The occasional attempts of the Italians to combine the dome with Pointed work is deserving of great attention, the domes of Siena and Florence cathedrals and of Sta Maria della Pieve at Arezzo being examples of the introduction of this feature by Gothic architects.

The dome of Siena Cathedral is a most interesting illustration. Rising from a hexagonal base at the intersection of the cross, it causes the great north and south piers to stand in front of the arches opening into the transepts, raising some speculation in thinking minds as to what would have been done with these huge masses of black and white marble had the great projected new nave running southwards become an established fact.

The alterations of the Baptistery at Pisa, and the exterior of that at Pistoja, are instances of the success with which the Tuscans could treat their external details, while the remarkable church of Il Santo at Padua is roofed in imitation of St. Mark's, Venice, with a succession of domes.

Allusion was made in the remarks on Italian groining to its almost universally domed character; and there is a very singular instance of a square vault or dome, if so it may be called, nearly 60 feet in diameter, and dating from about the end of the thirteenth century, over the baptistery on the north side of San Giovanni at Lucca.

Within a short walk of Perugia is the curious church of Sant' Angelo, a polygon of sixteen sides, opening into an aisle, and with its roof supported by arches which cross the circumscribing aisle and rise to a Pointed arch at their intersection in the centre.

The admissibility of the grand dome is the single point in which the Renaissance can compete with the Gothic. It is its one truly glorious offspring, one from which, unhappily,

we have been in a very great measure debarred, but it is only one against countless forms of majesty and beauty. Even the domes of Florence and Brescia, of the Umlta at Pistoja, of the Salute at Venice, and the Carignano at Genoa cannot contend, speaking interiorly, with the varied splendour of the lantern towers of Durham, Lincoln and York, or of Rouen and Coutances.

(To be continued.)

THE ROYAL INSTITUTE OF OIL PAINTERS' THIRTIETH EXHIBITION.

THERE is a certain obviousness, though not too pronounced, in comparing or contrasting this Piccadilly Oil-colour Exhibition with the contemporary Water-colour Show in Pall Mall East. In so doing it becomes apparent that the comparison or the contrast is greatly in favour of the latter. It is not possible to suggest a cause for the grievous disparity between one and the other; the fact must merely be accepted. Indeed, in strolling quietly around the galleries in Piccadilly a sensation of spirit-weariness became manifest—one of sullen dissatisfaction that so little meritorious work of the first rank was to be seen. For there in an Exhibition with over three hundred and fifty catalogued entries not one-fifth could in sincerity be marked with the cachet of canonistic art.

Mr. A. F. Hayward, in "Trefoil and Daisies," "Sweet Peas," and "Wild Flowers," shows delightful studies; flowers are evidently an unsealed fountain for him, and he has drunk of the waters to some purpose. Mr. Glyn Philpot in "Paschal Light" has produced a striking ensemble; the yellow haze of candle-light, bathing the ministrants at the altar, the foreground candelabrum, the harmonious background, all show good work. Mr. W. A. Breakspeare's "A Spanish Smuggler" is one of the best of the exhibits; it is forceful and toneful. The late Onslow Ford is well represented by a marble bust of the late Alma-Tadema, a speaking likeness, and full of vivacity; modern portrait-sculpture as good as this may be seen, but not very frequently. As regards oil-portraiture, Mr. F. M. Skipworth's contributions leave nothing to be desired; "Violetta" is a revelation of fine work, and "Mrs. H. B. Dale" is scarcely less fine, the slight difference in effect being possibly due to the difference of personality. Unstinted praise, too, is to be accorded to Mr. Calkin's portrait of Major-General Henneker, C.B. Other excellent portraits are Mr. Birley's "Sir William Clayton" and M. Bertieri's "La femme qui passe" (his wife) and "Mlle. de Gray."

A perfect little sketch is Mr. Carlton Smith's "At the Cottage Door," showing a girl peeling apples; the architectural background is sympathetically portrayed. Mr. A. G. Bell's "The Storm" is intensive with its heavy pall of threatening storm-clouds, permitting but a slight patch of deep blue sky to show through, and the storm's malign influence on water, bank, and windmill is satisfactorily depicted. Mr. John White has three noticeable exhibits in "Red, White, and Blue," "Under Cawsand, Dartmoor," and "The River and the Rill." Mr. Van Someren's subject-study from the "Pilgrim's Progress" is pleasing work of a high order, but Selous' sartorial treatment of Christian in close-fitting garments is preferable to this artist's scheme of showing the pilgrim naked, even if unashamed. Mr. Ernest Parton, too, deserves notice for "The Lake at Evening." Mr. J. Orrock has an excellent canvas in "Norman Ferry."

Of the four pictures by the President, Mr. F. Walton, attention will be drawn here merely to "A Distant View of Hindhead." Mr. J. Olsson in "Brewing Storm" is as realistic as Mr. Bell in a like subject; the boat in the midst of a waste of waters appeals forcibly to all "who go down unto the sea in ships." Mr. E. G. Walters may be heartily congratulated upon "A Summer Evening in Sheerness." The Vice-President, Mr. T. B. Kennington, has an intimate knowledge of facial expression; "The Glory of Woman" shows a young lady combing her auburn tresses, and "The Pledge" and "A Merry Heart Goes all the Way" deserve fully appreciative notice. "Isle of Mull from Monk's Bay, Iona," is Mr. Leslie Thomson's sole contribution, but it is a worthy one. A veritable poem is Mr. A. Severn's "Rain Clouds at Sunset." Mr. Allan Davidson has good work in "The Smith," with pleasing chiaroscuro; and Mr. A. E. Proctor's "The Old Mill-wheel" is one of the best exhibits; and this, again, may be said of Mr. Spenlove-Spenlove's "At the Wane of Day." Mr. F. Topham presents work reminiscent of what we most admire when examining "In a Garden on the Solent." Mr. F. Dodd has one of the pleasant

camaraderie pictures in "At the Sign of the Anchor"; other works there are worthy of notice, but perforce unnoticed here.

And now, having stood for a while on Mount Gerizim, let us cross over to Mount Ebal. Mr. F. Carter's "Summer Evening" is not our ideal for the subject, with its crude treatment and dull palette; nor is Mr. Dugdale's "Morning" more attractive, depicting a female fearfully out of drawing and just doffing her last piece of night attire, as she stands beside her bed. And what can be said in favour of Mr. Ginnett's "The Bather"? It is at once crude, dirty, and out of drawing. "Trevail Cove," by Mr. Louis Sargent, is cruel; it shouts at the spectator, art is absent, and only pigment present. Miss Muriel Olsson's "Hyde Park Corner" is mere child's work—or play. "A Critic," by Mr. Almond, shows a most disagreeable subject as regards facial expression and "Revolutionary" attire. "The Nativity," by Mr. Quinn, is but a blur. Mr. Broûn-Morison's portrait of (?) his daughter is not admirable with the death-mask effect of the face.

Once again we have the doubtful pleasure of viewing Mr. Lee Hankey's work; it is true "she" is "In the Wood," but that should suggest her being clothed, not naked; and "Early Morning" is rough and uninteresting. Miss Gloag, whose work is well known, cannot be congratulated upon her three contributions, "A Bunch of Flowers," "Sleep," and "The Yellow Coat." The first and third give us colour without a trace of Art, and the second is poor and wanting in refinement of treatment. Once again we would emphasise the fact that the portrayal of the nude is not only justifiable, but may also do much to correct the false and prurient ideas so unfortunately prevalent; but the portrayal must be in the manner so eloquently and artistically typified by Leighton and his school. Mr. G. D. Davison's "Afternoon—Pimlico" is a terrible aujourd'hui daub; and Mr. Spurrier's "The Basket" is garishness supreme.

Even as we are unable to give space to criticism of all that is worthy, so too are we debarred respecting what is unworthy. But even after allowing for natural differences of opinion upon points of art, details, and critical consideration, we doubt not that the general public will, by a large majority of its members, confirm the views that we have had so regretfully to express in the latter portion of this short review.

MANCHESTER SOCIETY OF ARCHITECTS.

MR. H. T. BUCKLAND read a paper on Wednesday, December 11, on "Pitfalls in Professional Practice."

Addressing himself to the younger members, he dealt with the small mistakes which architects would make.

He said that these stood out in their memory after years of practice as the missed putts to the golfer.

Dealing first with damp in walls, he described the bricks of the Midlands, and went on to recommend cement mortar in the proportion of 8 to 1 in preference to ordinary hair mortar.

He condemned the present tendency to design with flush sills and unthroated copings, and described how a tile creasing in one case had led the water right through the wall. Dealing with roofs, he referred to the unreliability of tiles.

Passing on to foundations, he described the dangers of clay in dry weather.

After touching on the shrinkage in timber, particularly maple, he went into the question of the responsibilities of architects in law.

A vote of thanks was proposed by Mr. Hardisty, seconded by Mr. Lodge.

In responding, Mr. Buckland admitted that he knew a perfect remedy for a smoky chimney, but unfortunately he was unable to publish it to the profession at large.

VICTORIA AND ALBERT MUSEUM

AMONG the recent acquisitions of the Department of Architecture and Sculpture in the Victoria and Albert Museum the following, which have lately been placed on exhibition, are of particular interest:—

A recumbent effigy of a knight in Reigate stone, painted, gilt, and decorated with gesso (A. 10—1912), was purchased from the Lesnes Abbey Excavation Committee of the Woolwich Archaeological Society, with the consent of the Governors of Christ's Hospital, the owners of the freehold. This figure, which may be identified as commemorating a knight of the De Lucy family, is an admirable example of an English monumental effigy of the London school, dating

from about 1320-40; the head is unfortunately missing, but the rest of the figure is well preserved and the remains of colour are extraordinarily brilliant. Such monumental effigies are of great importance, for they represent the direction in which English mediæval sculptors may be admitted to have excelled their contemporaries on the Continent; and it is fortunate that a typical example has been secured for the Museum, where it can be studied to greater advantage than the similar figures still to be found in English churches. Three boldly designed capitals and one shaft of Transitional type, dating from the end of the twelfth century, were purchased from the same site. The Augustinian Abbey of Lesnes, founded by Richard de Lucy in 1178, between Plumstead and Erith to the east of London, was suppressed in 1525; the effigy was excavated on the site of the Lady chapel. It has been placed in Room 8 at the foot of the stairs leading down from the main entrance.

Two candle-bearing angels of carved limewood (A. 16, 17—1912), by the great Franconian sculptor, Tilmann Riemenschneider (b. about 1468, d. 1531), were bought out of the funds munificently bequeathed by the late Captain H. B. Murray. These angels had long been known to special students of Riemenschneider's work, but their position in the remote village of Wolferstetter, near Kulsheim, in Baden, made them difficult of access, and their high qualities could hardly be discerned under a disfiguring coat of modern paint. The colour has now been carefully removed, and the beautifully carved surface of the figures revealed; they may be dated about 1510. The Museum has possessed for many years a large group of two figures, forming part of an altar-piece of the Holy Kindred, by Riemenschneider, and two little heads of Adam and Eve, which, if they are admitted as his work, must be considered his masterpiece in sculpture on a small scale.

A further acquisition out of the funds of the Murray Bequest has been that of a small and exquisitely finished group in wood of the Lamentation over the Dead Christ (A. 15—1912), the work of a sculptor of the Middle Rhine district in the first half of the sixteenth century; the treatment of the heads to some extent recalls the work of Conrad Meyt, of Worms. It was formerly in the Spitzer and Dollfus collections, dispersed in Paris in 1893 and in March of the present year respectively. This group and the two angels are temporarily exhibited in a case on the staircase to the right of the main entrance, outside Room 62, previous to their being placed in Room 100 with the remainder of the Murray Bequest.

Besides the acquisitions by purchase, the Department has been generously presented by Miss S. Mary Forbes with a life-sized terra-cotta group of a mother nursing her baby A. 27—1912), by Jules Dalou (b. 1838, d. 1902). This is exhibited in a recess of the entrance hall immediately to the left of the main entrance.

PROPOSED GOVERNMENT OFFICES IN EDINBURGH.

The following memorial as to the proposed erection of public offices in Edinburgh has been sent to all the Scottish M.P.s:—

December 10, 1912.

Sir,—We desire to call your attention, as the Parliamentary representative of a constituency within our provinces under the Royal Institute of British Architects, to what we consider to be at once a public injury and a serious interference with the free practice of architecture in Scotland, in the placing by the Government of the design of its building work in Scotland with H.M. Office of Public Works in Edinburgh, instead of, where possible, employing the services of outside architects.

For years this practice has been on the increase, until now the amount of work controlled by the office is much more than can be handled with good results by its chief architect, with the result that a large proportion of it has to be delegated to irresponsible assistants, while the opportunities of private architects are correspondingly diminished.

We are not without appreciation of the great ability shown by the present holder of the office in question, but altogether apart from the question of individual skill, we are strongly of opinion that the employment of an outside architect for all routine work is to be preferred in the public interest for the following reasons among others:—

1. All experience of departmental work of this nature shows the oncost in relation to the value of work executed to be greater, when everything is accounted for, than where

done by outside men. From figures put before us we have reason to believe that in the case of Government offices doing architectural work, such oncost is considerably in excess in this respect.

2. The lack of personal responsibility on the part of the designer when an official tends to indulgence on his part in extravagance in design and finish, and this is accentuated when his experience has been confined to the work of a public office where personal interest is not closely involved in controlling expenditure. On the other hand, an independent architect, being freed from inside influences, and accustomed to be held personally responsible for ultimate cost, is in a much better position to look after his clients' interests in that respect.

3. When an official architect is employed there is no second opinion as to the quality of his work. On the other hand, when an outside architect is employed, the Government still have the benefit of the advice and criticism of their official upon the work produced.

We have also to complain of the manifest injustice and hardship involved to the general body of Scottish architects, who, through taxation, are under the necessity of contributing to the upkeep of a department which occupies the position of a favoured competitor.

We address you especially at this time, as we have reason to believe that, in addition to the large amount of work with which the department is already burdened, the Government now contemplates handing over to it the important buildings to be erected on the site of the Calton Jail in Edinburgh, and we beg that you will use your influence to the end that this policy may not be adopted, but that instead, and on the above-mentioned grounds, arrangements may be made for placing this work with outside architects, preferably by competition.

In making the foregoing suggestions, it might be pointed out that the system advocated has already been adopted in England, the designing of many of the more important Government buildings recently erected having been placed in the hands of outside architects, amongst which might be quoted the War Office, the Local Government Board Offices, the British Museum, the Admiralty Offices, &c.

What makes the profession regard this particular matter with more than ordinary anxiety is that the site to be dealt with is undoubtedly of unrivalled importance, the opportunity of treating such a site probably not having occurred in the history of Edinburgh, and the treatment of any building placed upon it will call for the very highest architectural skill which, it is considered, might be most readily secured by obtaining the various ideas of the profession at large by such means as the organising of a public competition.

We are, &c. (signed by representatives of Edinburgh Architectural Association, Glasgow Institute of Architects, Aberdeen Society of Architects, and Dundee Institute of Architects).

DECORATING A PRINCESS'S FLAT.

MR. HENRY WILLIAM VEREY, the Senior High Court Official Referee, began on December 12 the hearing of an action by Messrs. Hampton & Sons, Ltd., of 8 Pall Mall East, against the Princess A. de Lusignan for the recovery of £162 5s. 11d., for decorating her Highness's flat at No. 11 Wellington Court, Knightsbridge.

Mr. F. Mellor (plaintiffs' counsel, instructed by Messrs. Gerard & Arthur Marshall) said the flat in question formed part of the handsome red-brick buildings near Knightsbridge Barracks. The Princess had occupied a flat on the fifth floor—on which the main part of the work was done—and she had some other rooms on the floor above. It was, counsel pursued, in January, 1911, that instructions were given for a representative of Messrs. Hampton to ascertain of the Princess at the flat what was required. On January 28, 1911, the first estimate was sent in, but that was subsequently revised. On February 16 what was called the revised specification, relating to decorative and electrical work, was submitted, and the project was eventually carried into effect. Referring to contentions set up on behalf of the Princess, counsel remarked that the defence apparently was that work was negligently done and that £100 tendered before the action by her Highness was sufficient. Counsel submitted that the work had been fully and completely done. Whatever trivial defects there might have been, Messrs. Hampton, from first to last, had been willing to put everything right, if only they had been given the opportunity.

Evidence was given by Mr. John Harvey Coney, building surveyor, employed by the plaintiffs, and who had entire charge of this work. He repudiated the suggestions as to defects in the work. He added that his firm used only the very best of building and decorative materials. Assuming that there were certain defects and his firm were liable, witness thought that a sovereign would put them right.

Mr. R. B. Mann, F.S.I., said in the course of evidence for the plaintiffs that the work generally had been well done.

Mr. T. E. Haydon (instructed by Messrs. Redpath, Marshall & Holdsworth for the defendant) said that he could not call the Princess, who was suffering from heart disease of a very severe kind. He submitted that the defendant, in tendering before action and bringing into Court £100, was amply satisfying the requirements.

Counsel submitted that this was a case of *quantum meruit*.

Mr. George A. Hall, F.R.I.B.A., who had been sent to examine the work at the flat on behalf of the defendant, spoke of various alleged decorative defects in the flat, these relating to fastenings in the drawing-room. These, he said, had not been lacquered for a long time. He also criticised the material of a picture rail in the oak room. The ordinary precaution of sand-papering the rail had not been observed. Witness added that he would not have passed such work in a flat let at £360. In the dining-room the paper was badly hung and trimmed. The ceiling in a bedroom was defectively done. Knots in the wood were showing through the paint. In his opinion there had been a lack of supervision.

Mr. Haydon said that Mr. Martin, member of a firm of builders who had given evidence, had measured up the work and put in a tender, assuming that the work was to be executed on the basis set down in the specifications. Mr. Martin had said that a fair price would be £107. Mr. Martin had not examined the work for defects, but he had noticed that much of it was poorly done, and he had considered that £90 was the outside that ought to be paid to Messrs. Hampton. Mr. Haydon enquired what Mr. Hall had to say.

Mr. Hall replied that if the estimate for £107 had been put before him he should have reduced it.

Mr. Haydon: Having regard to the condition of the work when you saw it, it would be easier to tell defects than when Mr. Martin inspected the premises?—Yes, time shows.

What do you say would be a fair value of the work to the Princess?—I should think £90 absolutely.

That is an outside figure?—Yes.

Mr. Mellor (cross-examining): I am taking it that in your opinion the difference between the estimated work and the value of the work which the Princess has had is a difference between £90 and £107?—Yes.

Do you think there is any single defect that you did not notice?—I should be surprised to hear of anything that I had omitted.

On December 16 Mr. Verey gave judgment in favour of Messrs. Hampton, the plaintiffs. He thought that the correspondence showed that Messrs. Hampton had always been ready and willing to rectify whatever small defects there might have been, and he was of opinion that the attitude taken up by the Princess in that connection was somewhat unreasonable. Proceeding, the Official Referee said that the question he had to determine was whether or not the work had been substantially completed. He had listened with very great interest to the arguments raised by Mr. Haydon, the defendant's counsel, and to his analysis of the evidence. He (the Official Referee) had had, however, the evidence of Mr. Coney, on behalf of the plaintiffs, and that evidence, he considered, stood uncontradicted. Having reviewed the various items, Mr. Verey said he came to the conclusion clearly that Messrs. Hampton had substantially carried out the contract; that they had done the work specified; and, taken on the whole, that they had carried it out in a proper manner. He thought, however, that some slight deduction should be made for the cost of making good little things to complete the work. For that he allowed £2 5s. 11d., for the matters were very trifling. Bearing those deductions in mind, the plaintiffs, Messrs. Hampton, were entitled to judgment for £160.

Mr. Haydon, for the defendant, asked for a stay of execution in the event of an appeal, but Mr. Verey did not entertain the proposition.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

A GENERAL meeting of the above Society was held at the Institute, Cookridge Street, Leeds, on Thursday evening, December 12.

The President, Lieutenant-Colonel Kirk, A.R.I.B.A., was in the chair, and there was a good attendance of members.

Mr. J. H. Foggitt's and Mr. Piet de Jong's drawings of a "Tour in Italy" were on view, and a paper on the tour was read by Mr. Foggitt.

Mr. de Jong (who was the joint winner of the Soane Prize last year) shows wonderful versatility in his work, which comprises measured drawings in pencil and colour of palaces in Florence, tombs and fragments from the Forum at Rome, water-colours in Venice, and numerous examples of work in Assisi, Genoa, Siena, &c.

Mr. Foggitt also has a fine and interesting show, his drawings and sketches in pencil being crisp, and the detail truly rendered. His measured drawings of the church of S. Maria del Popolo are particularly well executed.

A vote of thanks was proposed by Mr. A. Winch, A.R.I.B.A., seconded by Mr. J. Braithwaite, A.R.I.B.A., and supported by Messrs. C. D. Howdill, A.R.I.B.A., and Douglas Bowman, and carried with great enthusiasm.

COMPETITION NEWS.

CHESHIRE.—The Education Committee have decided, after full consideration, that in all future competitions for new schools architects be informed that plans will only be accepted subject to a bona-fide tender being obtained within a reasonable amount of the sum stated when submitting the plans, and that application be not made to the Local Government Board for the loan for the building of a school until tenders for the work have been received and provisionally accepted.

GLASGOW.—At last week's meeting of the Corporation the minute of the Committee on Municipal Buildings was approved. It contained a report regarding the preliminary sketch designs invited from outside architects for the proposed extension of the Municipal Buildings. Dr. John James Burnet, architect, the assessor in the competition, reported that sketch designs had been received from 100 competitors. Dr. Burnet and the City Engineer examined the designs in the preliminary competition, and on his recommendation the following gentlemen have been invited to enter the final competition: Messrs. Keys & Dowdeswells, Bucks; E. Vincent Harris & Moodie, London; Watson & Salmond, Glasgow; James B. Fulton, London; James Wright, jun., and W. J. Blain, Glasgow.

GLASGOW.—At the quarterly meeting of the Glasgow Provincial Committee for the Training of Teachers, the Chairman, in presenting the report of the Chairman's Committee, mentioned that the negotiations for the purchase of the new Training College site at Jordanhill, extending to about sixty acres, had been completed, and that the site was now the property of the committee. The Scotch Education Department had agreed to steps being taken to obtain competitive designs for the realisation of the committee's building scheme, embracing the provision of Training College buildings for 1,200 students, with a demonstration school, hostel accommodation, &c.

LLANDUDNO.—The Urban District Council accepted two schemes for the laying out of the Happy Valley and the Wyddfyd Estate. A large number of plans and specifications were sent in. The premium of fifty guineas will be divided between Messrs. Henry Pierce & J. B. Walker, Lakeland Nurseries, Windermere, and Mr. W. H. Matley, architect and surveyor, Manchester.

A GENERAL meeting of the Glasgow Institute of Architects was held on the 11th inst. in the Secretary's chambers, 115 Vincent Street, Mr. A. N. Paterson, A.R.S.A., President, in the chair. The Secretary reported what the Council had done as to various matters since the last meeting: (1) The Council had regretted to find itself under the necessity of formally reprimanding two members of the Institute for sending in plans in a competition which had been barred by the Institute; (2) the Institute's suggestion to the Govan School Board that an assessor be appointed in connection with their new school had been accepted; (3) that Mr. J. M. Monro had been appointed representative of the Institute on the Board of Governors of the Royal Technical College.

THE COLLEGES OF OXFORD.

THERE are many points of view from which the history of the Old Colleges of Oxford can be considered, but that with which we are particularly concerned is naturally their architectural development. In the earliest days of Oxford's importance as a seat of education and learning there can be no doubt that Halls were of more general institution than Colleges; to-day St. Edmund's Hall is the sole survivor, and even its existence is threatened.

A Hall was originally little more than a mere hostel or boarding-house for the temporary accommodation of undergraduates during their residence at the University, while the College was expressly intended to promote the prosecution of advanced studies by post-graduates, coupled with the obligation to carry on certain specific religious services for the intention of the founder, benefactors, and their kin while living, and for their souls' health after death. Thus, while the only essentials of a Hall were sleeping accommodation, a hall or apartment for meals in common, with the necessary kitchen and other adjuncts for their provision, the constituent parts of a College came in course of time to include a common gate, with porter's lodge attached, a lodging for the head of the house, accommodation for the other members, muniment room and bursary, library, chapel, and, lastly, a common room.

At their first foundation the Colleges were intended to be occupied by a limited number, and, until New College was founded in 1370 by William of Wykeham, began as a conglomerate structure made up of pre-existing hostels or sets of tenements thrown into one and adapted by incorporation with more orderly new buildings; hence there arises the distinctive feature of planning of an Oxford College. The various hostels which were needed to form a College consisted of a collection of dwellings side by side, each self-contained and having a separate entrance and staircase leading to its own sets of rooms absolutely insulated from those of the contiguous premises. Thus the staircase rather than the corridor is the key note of the planning of an Oxford College and the medium of intercommunication between the other sets of rooms.

In the earlier Colleges there obtained the universal practice that each set of rooms was occupied by two

or more persons at once; thus the founders of New College, Magdalen, and Brasenose ordained that there should be three occupants in the smaller sets and four in the larger. The introduction of Commoners—that is, persons who paid for their keep—was a contributory cause for discontinuance of the common tenancy of sets of rooms and their occupancy by single individuals. This change of principle and the continuous expansion in numbers led to such extensive enlargement, alteration, or rebuilding of the old Colleges that their original features and arrangement have in almost every case been swept away or obliterated.

The quadrangle is so closely associated in our minds with Oxford Colleges that we can hardly conceive any arrangement of College buildings in which it does not form a principal and inevitable component; but it was very far from being so until William of Wykeham established the quadrangle type of plan at New College.

Wykeham also started the fashion for placing a lodging for the head of the College over the common gate, which forms an exclusive entrance, and it appears that he did so for the purpose of facilitating supervision, a matter of some importance when the undergraduates were boys of twelve or thirteen.

The halls of the old Colleges followed and still retain the model of the great hall of a mediæval house, hence they are usually of one storey and covered with open timber roofs.

Wykeham's position as a pioneer in College planning is further shown by the fact that New College was the first to possess a private chapel for its own exclusive use, the previous arrangement contemplating the use by the Collegers of the parish church in which the College stood, so as to avoid interference with the jealously guarded rights of the parochial clergy.

Wykeham's chapel at New College is of particular interest on account of his introduction of a transeptal ante-chapel, which appears to have been intended, for one thing, to provide room for formal scholastic disputations, and, in the second place, for making a solemn station in front of the great rood every Sunday and principal feast day before the celebration of High Mass; and as his foundation comprised a large priestly staff, his ante-chapel provided space for additional altars. The post-Reformation instances of wide ante-chapels at Wadham, Oriel, and Brasenose are anomalies arising from the fact that the true significance of Wykeham's design had already become misapprehended and forgotten through disuse.

In common with many other repositories of mediæval ecclesiastical art, the Colleges of Oxford suffered severely from the sixteenth and seventeenth century frenzies of iconoclasm.

The adoption of a cloister in the plan of Oxford Colleges appears to have been due to its traditional function of enclosing a graveyard, and again here Wykeham was a pioneer, as his New College, being the first to be exempt from parochial jurisdiction, enjoyed an immunity carrying with it the right of sepulture within its walls.

Professor E. S. Prior points out that William of Wykeham at Oxford drilled and captained the English Gothic masons in the system of fan-vaulting, and the vaulting at Oxford so constructed he describes as stone engineering of extraordinary temerity, but showing no weakness. Certainly the protracted fecundity of fan-vaulting in the architecture of Oxford is an astonishing paradox, lasting as it did as late as 1716, the date of Dr. Radcliffe's gateway at University College, and what is true of fan-vaulting applies also to the forms of Gothic architecture generally.

It is at Oxford that the latest fashions of Perpendicular English Gothic are to be found, and it is due to this persistence that, with the exception of a few

isolated fragments, Renaissance work is hardly to be found in the Oxford Colleges until Palladianism had been firmly established in the eighteenth century.

From the historic point of view the Colleges of Oxford have suffered severely from pulling down, rebuilding, and extension in the nineteenth and even the twentieth century, so that in order to appreciate their architectural history reference is required, not only to photographs of the buildings as they stand to-day, but to drawings and engravings showing their aspect in the past; and for the assistance of study in this direction there could hardly be a more valuable guide than the sumptuous volume* on the Old Colleges of Oxford, by Mr. Aymer Vallance, which is a monument of research on the part of the author, and of exquisite production on the part of the publisher.

Mr. Vallance has treated the subject from the point of view of architectural history, and the former aspect of the Colleges is put before us by the reproduction of a complete set of Bereblock drawings made for the entertainment of Queen Elizabeth in 1556, whilst their aspect some hundred years later is shown in Loggan's views of the Colleges in 1675, the original engravings of which have been reproduced by the collotype process.

For the first time, also, some of the drawings made by J. M. W. Turner, R.A., for the Oxford Almanack are reproduced direct from the originals, while the present aspects of the buildings are brought before us with the assistance of collotype reproductions of excellent photographs by A. E. Walsham. A full bibliography is included, but for the majority of readers is scarcely needed, as the author's description is full and complete and the illustrations ample; so that the book cannot fail to become the classic authority on the architectural history of the Old Colleges of Oxford.

NOTES AND COMMENTS.

THE King Edward Memorial Committee could hardly have come to any other decision than to abandon the proposed site in Green Park fronting Piccadilly when a suggestion to do so came from the King. From the first there had been numerous objections, many of them well founded, to the Green Park site, and there is no doubt that that now proposed by his Majesty is free from all of those objections and affords a better opportunity for the unrestricted conceptions of the sculptor and architect who are collaborating in the design of the memorial. From the popular point of view there can be no question that the new site is eminently suitable for a memorial to King Edward VII., nor is there any objection to the removal of the statue of Lord Napier to Trafalgar Square, which may very well come to be regarded as the Valhalla of our heroes in the United Services.

The ultimate issue of the proceedings taken by Mr. Charles Archibald Daubney, District Surveyor, representing the London County Council, against Mr. Robert John Angel, Borough Surveyor of Bermondsey, for having failed to give notice in respect of works at Vine Street, Rouel Road, Rotherhithe Road, and Bermondsey Street, and for having begun such works without giving notice, is one which will be watched with interest by many of those who are concerned with property in the Metropolis.

The claim of the district surveyor is based upon the proposition that anything done to the foundation of a building or within three feet of a building must be "work" for which notice is required in Section 145. Alterations and repairs to drainage or sewerage work frequently, as in this case, come within three feet of the existing building and may presumably affect the stability

of the building, so that there is some justification for the attention of district surveyors, but the really vital point is that if district surveyors are entitled to notice they are entitled to fees, and the amount of the fees, according to schedule, would in many cases make a considerable addition to the cost of drainage work already sufficiently heavy for those who own old property.

We have before us at the present moment a case in which the drain is being relaid between two semi-detached houses and the excavation comes within three feet of both, therefore if the district surveyor is entitled to notice he is entitled to a fee in respect of "work" to both of these houses. The Magistrate at Tower Bridge Police Court, Mr. Chapman, before whom the summonses were heard, dismissed the charges against the Borough Surveyor, but has consented to state a case, the result of which we, with many of our readers, shall await with interest.

The *Manchester Guardian* contains an interesting article on what tradition says was at one time Sir John Thornhill's house in Dean Street, Soho, which contains some remarkable wall paintings that are also traditionally said to have been the work of Thornhill and William Hogarth.

Some novel points arose in a recent discussion on the housing problem by the Royal Philosophical Society of Glasgow. Professor Patrick Geddes, F.R.S.E., St. Andrews University, who initiated the discussion, prefaced his remarks with a survey of housing in Scotland, and remarked that in the development of modern cities it was manifest that the particular region between the Clyde and the Forth, divided as it assuredly would be by a canal which would make Glasgow a European port, would afford a substantial opening for the future of a great city, which, instead of finding Scotland on a siding of the world, would find it more and more on the main road of the world's traffic between Hamburg and New York. They had, therefore, to prepare for a great and living city, and, in a large and effective way, a city second to none. They in Scotland were at present peculiarly backward as regards housing compared with other civilised countries, and, however they might justify themselves in other matters, such as the education of their famous parish schools, their songs, the quality of their whisky, the excellence of the Waverley novels, the eminence of shipbuilding, and the distinctions of the Glasgow School of Art, they still remained one of the backward populations of Europe as regards housing. There was no question about it, and it was a necessary patriotism to realise that the proportion of rooms per inhabitant in this country was lower than that of their neighbours across the Border or of civilised people in other lands. That was a melancholy fact. They had too many one-roomed and two-roomed houses, and they should be spoken of as a nation of two-roomed dwellers.

Dr. Alexander Maclean, assistant to the Medical Officer of Health for Glasgow, said the beneficent influence of sunshine and fresh air on the life and welfare of the individual was not realised, and if realised was certainly ignored, in the planning of Glasgow in the past. Spasmodic attempts had been made to remedy this by the provision of various parks and open spaces, but parks and open spaces, excellent as they might be, were poor substitutes for abundance of sunlight and fresh air in the dwelling-houses themselves. The principal cause of the dissemination of tuberculosis and zymotic diseases in large towns was undoubtedly overcrowding of persons, houses, flats, and tenements. Direct sunlight had a most powerful germicidal effect on all known pathogenic organisms. The bacilli of tubercle were killed by two hours' exposure to sunlight; those of typhoid fever in one to two hours, 99 per cent. of them being killed in fifteen minutes; and even the resistant spores of anthrax bacilli were killed by three to six hours in bright sunshine. The sun, in virtue of its antagonism to all forms of pathogenic microbic life, exerted an influence

* *The Old Colleges of Oxford: their architectural history illustrated and described.* By Aymer Vallance, Oriel College, M.A. (London: B. T. Batsford. 84s. net.)

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

NO. 55 WESTGATE ROAD NEWCASTLE. (Hy. Walker & Son's Premises).

THIS house, which is now occupied by the above firm of ironmongers, &c. &c., is Georgian style of architecture, and was built about 1750. The chief interest in the house lies in its beautifully modelled plasterwork, part of which the drawing illustrates. The whole of the interior decoration was carried out by Italian workmen, and all the modelling executed in situ. All the plasterwork that exists is in the reception room and the staircase well. It may be added that this is the only real Italian decorative work left in Newcastle-on-Tyne.

on the well-being of mankind, the potency of which had only lately been fully recognised. Every dwelling-house should be so situated that the sun might strike some side of the exposure every day in the year. That this general principle might be given effect to three factors had to be taken into consideration—the width of the streets, their direction or orientation, and the height of the buildings bounding these streets.

The Christmas Number of *The Connoisseur* does not contain much of purely architectural interest beyond reproductions of illustrations from "Picturesque Nepal" and "Byzantine Architecture" accompanying reviews of those books. An ebony cabinet supposed to have belonged to Mary Queen of Scots and a recently discovered plainly treated fifteenth-century stone mantelpiece complete the tale. But the second part of Mr. C. Reginald Grundy's articles on Mr. Fritz Reise's mezzotint portraits is a finely illustrated description of typical examples.

R.I.B.A. EXAMINATIONS.

THE FINAL: ALTERNATIVE PROBLEMS IN DESIGN.

Instructions.

1. The drawings, which should be on uniform sheets of paper of not less than Imperial size, must be sent to the Secretary of the Board of Architectural Education at the Royal Institute of British Architects, 9 Conduit Street, London, W., on or before the dates specified below.
2. Each set of drawings must be signed by the author, and his name and address, and the name of the school, if any, in which the drawings have been prepared, attached thereto.
3. All designs, whether done in a school or not, must be accompanied by a declaration from the student that the

design is his own work, and that the drawings have been wholly executed by him.

In the preparation of the design the student may profit by advice.

4. Drawings for subjects (a) are to have the shadows projected at any angle of 45° in line, monochrome, or colour. Drawings in subjects (b) are to be finished as working drawings. Lettering on all drawings to be in a clear scholarly character.

Subject VII.

(a) A monumental staircase and vestibule to a large museum. Scale of drawings 8 feet to 1 inch with two ½-inch scale detail sections.

(b) A village inn with not more than eight bedrooms. The site, which is not a corner one, has an 80 feet frontage with no lighting available on either side. Scale of drawings 8 feet to 1 inch with ½-inch scale details.

Subject VIII.

(a) A covered carriage entrance to a large hotel built in stone. Drawings required: ¼-inch scale key elevation of the hotel facade and ½-inch scale detail drawings of the entrance.

(b) Design for a Gatehouse to a College. Scale of drawings 8 feet to 1 inch with ½-inch scale details.

Subject IX.

(a) A monument in a public place containing one or more fountains commemorating the bringing of water to a town. Drawings to ½-inch scale with one general plan of the place to ¾-inch scale.

(b) A design for a bank in a small country town on a corner site. Scale of drawings 8 feet to 1 inch with ½-inch scale details.

Dates for Submission of Designs in 1913.

THE NEW ENGLISH ART CLUB'S FORTY-EIGHTH EXHIBITION.

BEING asked our opinion as to the merits of this latest Exhibition of the New English Art Club, now opened in the Galleries of the Royal Society of British Artists in Suffolk Street, our interlocutor remarked that an unfavourable report might result from the fact that the Art Critic was perhaps already jaded by having inspected some other shows before wending his way Pall Mall-wards. Elementarily, there might be conceivably some justice in the remark, but in the present instance it cannot be conceded as the rightful explanation. For anyone really interested in Art would experience a sense of relief—of recuperation—in viewing works of merit under physically wearied conditions.

Such a preface cannot fail to indicate that the present show has lamentably failed to satisfy the critical judgment (we will leave it for others to say "acumen") of the writer of this review. It is indeed a sorry display—"Ah, take the cash, and let the credit go!" Yes, these pictures we doubt not will sell, but what credit *can* attach to most of them? Out of two hundred and five exhibits about one-seventh merit notice for praise—and even then often on a limited scale. It is depressing in the extreme to wander around these galleries, hoping (and mostly in vain) to see works showing signs of the maintenance of High Art; instead of that it is decadence rampant. Were it on the principle of *reculer pour mieux sauter*, it would be comprehensible, even if still deplorable, but we are of opinion that Art has reached its highest expression, and, therefore, it should be a case of maintenance under varied forms of this expression. Ah, vanity of vanities!

By-the-bye, Mr. Mark Gertler takes Vanity as the title of his subject in his one contribution; but the picture does not establish the justification of such a title, for here is depicted an unbeautiful mis-drawn nude female, afflicted with the jaundice, and seated in an armchair upholstered in emerald green, with a right-minded clothed figure in the background. Where is the vanity? No! but certainly "vexation of spirit" would have been a fitting title in the effect produced on the observer.

There is one artist, Mr. F. E. James, whose five contributions portraying flowers form the most satisfactory series on exhibition. He has a feeling for the graces of blossomed vegetation, which is not alone pleasant in itself, but creates a sensation of relief when the eyes encounter his work in the midst of so much that is poor. Miss Winifred Phillips might advantageously study Mr. James' flower paintings. Mr. F. S. Unwin understands breadth (which is such a valuable quality) in his sepia drawing of "Mont Major," and the architecture is well put in. Mr. R. Schwabe has only one exhibit, and this is a good crayon portrait-sketch of Master Y. G. Jones.

Mr. Augustus John's two contributions are very large—perhaps the largest on show, but their merit is not in keeping with their size. "The Mumpers," yes! but must they all be out of drawing and crudely coloured? Could not some at least have been dealt with so as to redeem in part the faults elsewhere in evidence?

We do not care for Mr. A. Rothenstein's eight works. Who would desire such a Chloe as depicted in No. 33? "The Wayfarers" is child's work, and a "Design for a Silk Panel" is one of the many exhibits which should not be hung, except in a Dark Room. In Mrs. Headlam's "The Apple Orchard" there is distinct promise; the colour scheme is at least harmonious, and is very subdued. "The Railway Station," by M. Verpillieux, is not at all bad, the platform crowds being well massed. Mr. D. S. MacLaughlan has some passably good work in a brown ink sketch of a "White Palace" and an original etching "Val d'Ema," though the latter is somewhat out of drawing. Mr. F. Dodd's "The Monument, Fish Street Hill," is effective and fairly well massed, and Mr. Rushbury's "Clifford's Inn" is a good sketch with decent chiaroscuro.

Mr. Squire's three contributions are indeed poor; one is entitled "They were afraid, and bowed down their faces to the earth." It would really seem as if on occasions the executant had in mind the gallery-visitor when giving titles to the pictures. Mr. Joseph Crawhall in "The Butcher's Boy" has a characteristic sketch, the horse being very well modelled.

Another of the eight-barrelled small-bores (would we could call them big guns!) is Mr. J. D. Innes; in "Mountains of Wales," "North Wales," and the rest there would seem to be a searching after a forgotten past period of Art, and a vain search it proves. Mr. Frederick Brown has satisfactory work in "August, 1912—Thunderstorm." "On the

Thames," and others. Mr. Gerard Chowne also may be commended for "Notre Dame de Vie," "In Regent's Park," and "La Route de St. Vallier Grasse," but "Honeysuckle" is not a success. M. J. E. Blanche cannot be congratulated on his oil-colour of "Tea-table and Lilies," which is hard and uncompromising.

Mr. William Rothenstein has one of the few really pleasing works in the Galleries in a "Panel for a Hypothetical Decoration" most harmoniously treated, and his "Babu Rabindranath Tagore" is quite characteristic of his brush and a pleasant relief after the mass of poor exhibits. Mr. Muirhead, an eight-piece contributor, is not one who delights the eyes; suffice it to refer specifically to "The Sisters"; variegated symmetry may be a quality of architecture, but not of painting. Herein are shown two vis-à-vis and corps-à-corps damsels, each resting their elbows upon the interposed table and each bent stiffly at right angles across this table, the one draped in crude green and the other in crude blue.

Mr. McEvoy may easily improve with practice; his technique is good in the portrait of Master A. Lousada, and the pose of the elder girl in the portrait group No. 136 is satisfactory. Mr. Wilson Steer also shows more than possibilities in his portrait of the Lady Clare Annesley, though the ensemble is anæmic. His picture "The White Yacht" is painted in a pleasant scheme of colour. Mr. Charles Gere has portrayed a very effective sky in "A Cotswold Holiday," and the whole picture is passably good, except that the red parasol is inartistically conspicuous.

Does Mme. Finch call her model "Eve" by reason of her insufficient drapery? Certainly if the title is a fanciful one it cannot be given for the sake of any beauty; the lady (of course, not more than half draped, as she is at dessert) is seated solitary at table, with a background of French wallpaper, which shouts at the spectator. But where is Adam? He is, however, welcome to his Eve. Miss Westray has an effective canvas in "The Veldt," showing the warm brown stretch of plain under grey skies.

One of the few good exhibits is Miss Fanner's "Six-metre Yachts Manœuvring"; it is breezy, well-treated brush-work, and from a bright palette. Mr. Stabb has an elementary study in "A Barge," and Mr. C. J. Holmes shows a childish daub in "Outside Rotherham." Mr. Somerville's "In the Studio" portrays a well-modelled and brushed-in head in good tones. Mr. Shackleton understands delicate colouring, and may improve in composition by practice. M. Lucien Pissarro, the most prolific contributor, is not one to be congratulated.

Ah, well! it has proved to be an Exhibition not calculated to freshen the spirit; its effect has been to throw into greater and more pleasant contrast the works previously visited on the same day. Art is eclectic, there is no doubt, but what a pity its eclecticism does not run in artistic grooves every time.

THE CHURCH OF ALL SAINTS, PAVEMENT, YORK.

By B. G. CURTIS COLLIER AND D. MORRELL.

THE church of All Saints, situated in the Pavement at York, has suffered in common with the street generally—which was at one time remarkably rich in mediæval architecture—from the vandalism caused by increasing commercial demands.

The historic associations of this street are as numerous as they are interesting. The church of St. Crux, originally standing at the other end of the street, with its beautiful Renaissance tower, has given place to an insignificant mission-room whose only redeeming feature is a fine Jacobean tomb. The Market Cross of Classical design, built by Marmaduke Rawdon, was "in the way," and, consequently, removed, and now the fine old timbered house where Harold held a hurried Council after the battle of Stamford Bridge is removed to the precincts of the cathedral to permit of the making of a new street. Yet much remains of interest in the beautiful fourteenth-century church of All Hallows, as it was previously called, and its position at the top of the gentle slope of Pavement is ideal, forming as charming an architectural composition as may be found in the city.

Almost the whole of the north side of the church is built of the ruins of the Roman *castra* Eboracum; but the most striking portion of the church is undoubtedly the lantern tower, octagonal on plan, that rises "lighter than a fire." It is said that this tower at one time held a lantern to guide the travellers approaching the city through the night, and when one remembers that the thickly wooded Forest of

OLD DONIBRISTLE HOUSE
ABERDEEN ~ ~ ~

G. S. AR. 23 1910.

Galtres formerly surrounded the city it is not unlikely that some such provision would be made. The tower still contains the pulley, and this, together with the large lenses preserved in the vestry, add a probability to what is for the most part conjectural. A bell, it is supposed, was rung during the night as an additional guide to travellers.

Access to the tower is gained by a spiral staircase built into one of the supporting piers, opening first into the clock chamber and then the belfry. The latter contains two mediæval bells inscribed thus:

“✠ See: Johannes: ✠ Ora Pro Nobis”
“✠ Ihes Nazarenum, Rex Ivdeorum.”

To gain the roof of the lantern one must perforce mount a ladder—the only communication with the top—but one is amply repaid for the somewhat adventurous climb by the magnificent view of the city, that stretches, as it were, in waves of pantile roofs dotted with chimneys and the towers of a score of churches.

The church consists of chancel, nave and aisles, and the present erection dates from the end of the fourteenth century, when it was almost entirely rebuilt. The main building, however, appears to be of an earlier date, as the windows of the aisles are Decorated, while the large west window, together with the lantern tower, reveal the Perpendicular influence. A possible explanation of this is that the church was originally built in the fourteenth century and restored and added to later. The lantern tower, while in nowise appearing incongruous, is undoubtedly an addition, and in all probability the tower, at the date of the building of the church, was but the ordinary square battlemented building peculiar to the Decorated period. A replica of this lantern is placed on the tower of St. Dunstan-in-the-West in London, and is a notable feature in Fleet Street.

In 1782 the chancel was sadly in need of repair, and the Corporation of the city obtained permission to have it removed, contributing by way of compensation £100 towards the fund for the restoration of the eastern wall, and the space thus obtained is now the Corn Market.

The springers only of the chancel arch remain, but the aisle transverse arches are still in evidence. Recently the plaster covering the interior of the clerestory and the eastern gable was removed, revealing traces of the earlier gable of the chancel. The clerestory, with its square-headed Perpendicular windows, is supported by the finely proportioned nave arcade, whose arches spring from octagonal piers with moulded caps and bases. The principal entrance to the church is on the north side, but the proportion of the doorway has been considerably spoiled by the raising of the street level; on this door is a sanctuary knocker.

The pulpit is octagonal on plan, surmounted by a canopy, and dates from 1634. It is ascended by winding stairs with carved balusters, the whole being a fine example of Jacobean woodwork, panelled and carved, while both pulpit and canopy are decorated with texts carved in quaint Gothic characters. The piers supporting the tower are also encased in woodwork about the bases, whereon is set forth the various charities and bequests of certain parishioners, long since departed. The lettering is that peculiar adaptation of the Roman so frequently used with such fine effect in the fifteenth and sixteenth centuries. The north wall contains a mural tablet to Tate Wilkinson, Esq., the famous eighteenth-century actor-manager, who controlled the “York Circuit,” supplying York, Leeds and Hull with dramatic performances.

One of the most unique features of the church is the oaken Perpendicular lectern (see drawing), which was removed to its present position when St. Crux Church was demolished. This lectern is in the shape of a Greek cross on plan, and miniature Perpendicular buttresses support a

central bookrest to which is chained a volume entitled “A replie unto Mr. Harding’s answere,” and dated 1566. At the corners of the central support are delicately carved effigies representing, no doubt, the chroniclers of our Lord’s life.

The beautiful glass that forms such a glorious feature in many other churches in York is not to be found here, some of the windows depending solely on the tracery for their beauty; but the soft suffused light of the clerestory adds a charm to the otherwise somewhat sombre and commonplace lighting.

Two quaint services are held annually, both in accordance with certain wills and concerning two City Guilds. At one the “Merchant Adventurers attend to be reminded of their latter end,” and at the other the Merchant Taylors. A considerable portion of the present churchyard was at one time, according to an old manuscript, a herb and fish market, but in 1783 the ground utilised for market purposes was procured by the parish as a burial ground.

On the south side is a porch—a later addition—now used as a vestry, also an organ chamber. The latter is decidedly modern, and, as is frequently the case with recent restorations, the surface of the stone is worked to such a degree as to give an almost cast-iron effect, and the absence of the Decorated pinnacles that adorn the roof of the main building accentuates the stiff formality of the modern erection. Nevertheless, the church is one of the finest examples of the combination of Decorated and Perpendicular architecture in York, and is probably only exceeded by the Minster, where the whole evolution of the art of ecclesiastical building in England can be traced, from the massive Norman to the magnificent if somewhat over-decorated work of the Tudor period.

NOTTINGHAM ARCHITECTURAL SOCIETY.

At the second meeting of the winter session, held December 18, two new Associates were elected.

The President, Mr. E. R. Sutton, F.R.I.B.A., announced that the Royal Institute had requested them to consider whether any alteration of the area covered by the Nottingham Society would be beneficial, and in accordance therewith the Council had communicated with the neighbouring societies. As, however, the attendance that evening was not a very large one, he proposed that the consideration of the matter be deferred to a special meeting to be held early next year. He also mentioned that a jubilee fund had been opened to put the Society upon a sound financial basis, and a number of members had promised donations.

Other business having been disposed of, Mr. Thomas Wright, the President of the Nottingham Camera Club and a Fellow of the Royal Photographic Society, gave a lecture on “Pictorial Architecture and Miscellaneous Subjects.”

Mr. Wright pointed out how proper grouping and suitable setting enhanced the pictorial effect of a building and how light and shadow added to its artistic value, illustrating his remarks by means of a large number of very beautiful lantern slides prepared by himself.

The Vice-President, Mr. Harry Gill, in proposing a vote of thanks, complimented the lecturer on the excellence of his slides and remarked that it had been one of the most instructive and interesting meetings of the Society. Mr. A. E. Heazell seconded the resolution.

THE FRIABILITY OF GRANITE.

I.—THE ORIGIN OF THE ROCK AND THE TYPICAL CRYSTALLISATION OF ITS CONSTITUENTS.

WRITTEN AND ILLUSTRATED BY JAMES SCOTT.

(The Crystals range from minute to large ones.)

To speak of the friability of so apparently impervious a stone as granite savours of an anomaly; yet it is really one of the most decomposable rocks in existence. To properly understand the subject of its disintegration we must pay some attention to its structure, and make brief references to its origin.

I will not at present attempt to make any differentiations, but will class all granites as one substance exhibiting slight variations and not fundamental differences. Nor will I involve myself in the debated ideas current respecting the primitive creation of the rock. One broad belief has been established—namely, to the effect that this and allied substances were at first molten, and, therefore, constituted a

mere paste. That this fluid stuff became subjected to tremendous pressure by the weight of overlying strata is also a widely admitted phase. The chief controversies centre around the problem whether water was present or absent during the formation of the constituents.

Summing up my own impressions based on observable facts and on a selection of suggestions it appears that the molten mass must have hissed through huge oceans, and that over it settled the organic and other debris of these regions, era after era, until nature so altered matters that all water had been shifted elsewhere. Rivers that had run into the oceans carried further quantities of refuse, and the paste was finally submitted to an extraordinarily powerful pressure. While it gradually cooled this paste hardened and crystallised into all kinds of forms.

FIG. 1.—Feldspar crystals. By corners dividing off along the dotted lines of the first figure, the second one is produced. Then growth on the right side (of the reader) causes the third object to develop.

It generally needs the aid of the compound microscope before these facts can be elucidated, and if this instrument had never been invented we should remain ignorant of one of the most wonderful facts that confront us—namely, that the hardest of granite and similar rocks are composed entirely of tiny crystals, many quite perfect in shape, held almost inseparably together in a matrix or petrified cement.

It is probable that no one will ever be able to prove the nature and character of the very first crust which covered the earth. It would appear that the granites have been remodelled several times over. Substances—possibly mineral and organic—were stratified and covered with water, or may have remained as dry land, and these sank down until they reached internal heat, and were then resolved into molten masses.

The latter were either consolidated in the manner already outlined or else were belched forth from volcanoes as lava. It is practically certain that had the rocks which now exist

FIG. 2.—Changes of the hornblende crystal, by separation of two of the corners of the first object (along the dotted lines) and then the apexes of the second figure.

as granite been allowed to remain exposed to the air they would have been simply a kind of pumice-stone, or dried lava.

The enormous mass of overlying earth was by some gigantic means, or else by persistent slower action, removed from the granite in many places, the granite no doubt being upheaved as well by earthquakes. Then denudation by rain and floods and the gases of the air caused its particles to be washed away and help re-form other stratas, which were in time remelted and relaid as granite.

In the next chapter are depicted microscopical sections of granite. These slices have been rubbed so thin as to be semi-transparent, so that their whole structure is very evident. All these details are contained within the space of a mere pinhole. This curious fact will help us to understand the subject of granite decomposition, to which I will soon refer in detail.

Every particle of granite consists of crystalline matter, the objects being of different colours and densities. The principal constituents of granite are feldspar, hornblende, mica, and quartz. There are many other minor ingredients, but we need not trouble about them now. According to the amount of the hornblende present so depends the greyness or blackness of granite. Pinkness is imparted by the feldspar, which has been stained that colour by the iron oxides (common rust is an oxide of iron) derived from metallic ores.

We have to remember that as these crystals are each distinct and individual it must be possible to separate them. But the cement—consisting of binding remnants of themselves—is so comparatively hard and impervious that it needs continuous action of the weather to affect them.

Feldspar is comparatively soft, and can be easily scratched with a finger-nail. On the other hand, quartz is exceptionally hard, and enables one to scratch glass with it.

There are really several varieties of feldspar, all, however, really composed of the same ingredients. The commonest kind may be either translucent or opaque, with a pearly lustre. It may be white, red, blue, or green, owing to the effect of contact with the products of metallic ores. It contains a very large proportion of silica and a fair amount of alumina, besides smaller quantities of lime, potash, and iron oxide. It can be fused into a grey, semi-transparent, glassy substance, and comes next to quartz in general abundance on the globe. Its crystalline forms are shown in fig. 1.

Hornblende is generally slaty in colour, and is crystalline. It has a glistening lustre, and may sometimes occur as dark bottle-green, brown-green, or brown-black in colour. When it is bruised or powdered, however, these colours are resolved

FIG. 3.—The mica crystal begins as a rhombic object, which loses its corners, increases in depth, and then gets bevelled edges.

into a greenish-grey. It breaks up rather easily under the influence of a knife, though it possesses a characteristic toughness. The strokes of a hammer will characteristically indent it, and it can be melted with the aid of the blow-pipe into a black glassy mass. It consists of about 42 per cent. of silica, with smaller quantities of alumina, lime, magnesia, iron oxide, manganese, and water. Its crystalline formations are shown in fig. 2.

Mica is frequently found isolated as crystals of a six-sided, tabular shape, or as rhomboidal prisms. In some parts of the world lumps over a yard in diameter are met with. It can be divided easily into thin fireproof plates parallel with the main planes, and is the familiar substance used as a substitute for glass. It may be white, yellow, green, brown, or black, and has a lustre which mimics that of many metals. Although it is so readily cut, the edges of the crystals are capable of definitely scratching glass. It contains silica, alumina, potash, and oxides of iron and manganese. It is the mica that glistens like specks of silver in granite. Its crystalline formations are shown in fig. 3.

Quartz can be found in several varieties, the chief constituent of all being silica (silex), which is an almost indestructible and unchangeable substance. Even with the blow-pipe it is impossible to fuse it, unless a flux is used meantime. Silica forms the main part of sand and flint. It is the most abundant and oldest of the earths. Quartz may be massive and beautifully crystallised, sometimes resembling large cut-glass objects. Rock crystal and quartz are practically identical with each other. In the sections made for the microscope its tiny crystals are quite transparent, and these generally have 2 per cent. to 3 per cent. of water in them. Quartz appears, however, to the naked eye as milk-white particles in granite.

When a couple of pieces of quartz are rubbed together there is produced a phosphorescent light and a smell re-

sembling that of electricity. It has been proved that in this way certain germs originate, the probability being that the fine dust that falls from the air provides the spores, which are by this means electrified into life.

These facts probably have an important bearing on the decomposition of granite.

In fig. 4 are shown the crystalline formations of quartz. It should be understood that in granite the crystals are seldom found in their complete beauty, with all their facets and planes arranged with perfect geometrical precision. The

the materialisation of a spiritual conception. Here Mr. Anning Bell fails also, and, therefore, it is necessary to regard some other aspect of Art to discover whether he is more successful.

But even when we regard Mr. Bell's colour schemes we are bound to confess to a sense of dissatisfaction; there is a general appearance of undue flatness, of want of harmony. However, in No. 56, depicting Mary as a child being fed by the angelic host, the colouring is both tender and harmonious in mauve and green, and this, too, may be said of "The

FIG. 4.—Quartz crystal changes. Corners vanish from the first object, and the figure then changes to the second. Increase of size of these corners (back and front) produces a double pyramid; which, by separating, results in the last figure.

confinement of the paste under pressure would not allow of such choice results occurring. What is obtained in this direction is, however, very interesting.

It should be remembered that some acids besides lime, soda, potash, &c., exist in granite.

ILLUSTRATIONS BY MR. ANNING BELL AND MR. EDMUND DULAC.

MESSRS. ERNEST BROWN & PHILLIPS are adepts at providing their patrons and the general public with interesting small shows, and at the present moment there are three, if not indeed four such, to be seen on the walls of the Leicester Galleries. Here, however, we are merely concerned with two artists, Mr. R. Anning Bell, R.W.S., and Mr. Edmund Dulac, respectively illustrating "Mary, the Mother of Jesus," and the poems of Edgar Allan Poe.

Mr. Anning Bell's work is a cult which is not to everyone's taste, despite which, or by reason thereof, it will be necessary for one lacking this taste to exclude rigidly from consideration all personal feelings, and to proceed equally rigidly on purely art-critical lines. And, so doing, it may be at once advanced that it seems quite unnecessary, and perhaps affected, to import the pre-Raphaelite timbre into the subject of the dawn of Christianity. The P.R. brotherhood may or may not have been justified in its views of Art, but these views were not applicable to the history of one century more than of any other; the style was a matter of technique all through, and adaptable to all times.

And, furthermore, if the subject of the dawn (or let us use the Persian simile "the false dawn") of Christianity is to be regarded historically and ethnologically, Joseph, Mary, Jesus, and their companions should be portrayed as Orientals; this, though elementarily true, is pretty generally one of the neglected verities, nor is Mr. Bell an executant who proves an exception to the rule. He also makes his angels too obviously human: as someone remarked to us, the types were the common ones of the London streets. Contrast such treatment with that accorded by Sir Joshua Reynolds, or—to be quite contemporary—with Mr. Blair Leighton's angel in his fine work "Into an Unknown Land," that graced the walls of the Royal Academy in 1911.

There is no reason to quarrel with Mr. Bell for his ethnological disregard in the portrayal of angels; for, according to human conception, these spiritual beings are of no one race, and, therefore, it would be natural for any artist to express them in terms of his or her own particular standard of beauty. An Ethiopian artist might conceivably portray black-skinned angels with broad and flat noses and high cheek-bones; and if that should be the Ethiopian type of beauty there would be no cause of quarrel with the artist. But this is certain: that beauty should be predominant in

Adoration of the Shepherds" and "Angels with Trumpets" (No. 67).

A really striking picture is No. 73, showing Mary and Jesus with Saints; the figures stand out well, but it would have been a great improvement had more attention been paid to composition; as it is, the figures as displayed almost force their enumeration by the spectator, instead of massing one with another. "The Child in the Manger" exhibits a prettily treated Mary, and she is also well portrayed in No. 61 at the foot of Calvary, a note of sympathetic treatment being struck that is all too conspicuously absent in general.

When we turn our attention to the works in illustration of the poems of Edgar Allan Poe we experience a sensible relief, and this is perhaps curious when regarded from one aspect. For whereas the brightness of Mr. Anning Bell's work might be thought to elevate the spirits, so the characteristic deep-blue tones of Mr. Edmund Dulac's brush might be expected to promote a feeling of depression. That this is not the case may be possibly an idiosyncrasy, and, as such, let it pass. Mr. Dulac is, on the whole, preferable in these water-colour drawings than in his black-and-white line sketches, though amongst these we have nothing but praise for "The Raven" (No. 2), "Tamerlane" (No. 37), and "Edgar Allan Poe."

That Mr. Dulac has entered into the spirit of this most imaginative of poets is evident when we regard such sketches as "The Bells" (Nos. 10 and 11), "The Haunted Palace," and "The Conqueror Worm." His delineation of the traceried window in "The Bells" (No. 3) is realistic. "Al Aaraaj" (No. 4) is one of the finer drawings; the two figures bathed in the light of the unseen moon are excellent, and are redolent of Burne-Jones. "Bridal Ballad" shows a girl of the Rossetti type, well posed, and "To One in Paradise" is a charming sketch. But we have one cause of dissatisfaction with our artist, and this is the cotton-wooliness of his clouds, as seen in "Dreamland," "Al Aaraaj" (Nos. 17 and 38), and others; but this is not much amidst the general excellence of the work. "The Bells" (No. 14) is another architectural conception, showing dark tower and spire against one of Mr. Dulac's rare lurid skies. "To Helen" (No. 20) is a most attractive drawing, the sole adverse criticism to offer being that the eyes are exaggerated in size. But the gems of the collection are "Silence" and "Venise" (No. 42), the latter illustrating some graceful lines by Alfred de Musset. "Silence" shows the reclining figure of a girl with a harp close by her, the whole supported against a heavy dark-blue background. "Tamerlane" (No. 36) has more colour than is customary in Mr. Dulac's sketches. "Venise" (No. 41) is effective with St. Mark's as the background. The pity is that in so many instances the delightful tones of these sketches have failed in reproduction. We do not mind how soon we see another exhibition of this artist's work.

THE PANAMA CANAL AND OTHER DRAWINGS BY MR. JOSEPH PENNELL.

OUR earliest acquaintanceship with Mr. Joseph Pennell's work was that fascinatingly illustrated book written by his wife—we refer to "Our Sentimental Journey." In subsequent years his pen and pencil have engaged our attention in connection with the architectural subjects that have appeared in the pages of magazines and elsewhere. The outstanding qualities of his technique are the extreme delicacy at one end of the scale and the commanding vigour at the other. It is the latter which is more in evidence in the present exhibition at the galleries of the Fine Art Society in New Bond Street, where we see some of the results of his labours in Europe and America.

Mr. Pennell has the faculty, possessed by but a few, of suggesting, without actually expressing, architectural detail; instances of this are sufficiently numerous, and amongst others Nos. 1 and 2 (of "Old and New Rome") may be cited. The "Puerta Visagra, Toledo," is an example of the more purely architectural in touch, and it is of interest to contrast this with the "Gate of the Zocodovar, Toledo," where the actual lines are of the fewest, though the effect is as of a complete drawing. Where Mr. Pennell draws industrial sketches he uses the virile touch with an *empresement* that is notable; and, as indicated earlier, such sketches form a large proportion of the present exhibition, such as the series (twenty-five in number) of the Panama Canal Construction Works, the sketches Nos. 10-29 embracing Chicago, Niagara, and Belgium, and some of the drawings made in England, France, Germany, New York, and Pittsburg. Of these we may instance a few, such as "The Steel Works at Gary," "The Traveller, Charleroi," "Coal-Breaker, Shenandoah," "Gun Factory, Creusot," "The Cut towards Culebra," "Dinner Time," and "The Bottom of Pedro Miguel Lock" (the last three forming part of the Canal series). "A Modern Hobbema, Charleroi," is an example of the more fairy-like touch, and this, too, may be said of "The Cross at Charing Cross." Two extremely good works are "Charing Cross Bridge (Night)" and "St. Paul's from my Window," these two recalling Whistler at his best. Effective in a different way is a Chicagoan sketch, "Under the Bridges"; the bright sky beyond the gloom of the arches proves telling in contrast. But we should be inclined to give the exhibition palm to "Entrance to Henry VII's Chapel," in its gloomy and mysterious impressiveness.

Some of the works are not up to the Pennellian standard; "Steps, British Museum," has poorly-executed portico columns, nor are "230 Strand" and "St. Paul's on Ludgate Hill" attractive; "St. Paul's from Bankside" (an aquatint) and "Rouen Cathedral under Repair" are excellent, however; and "Ponte Vecchio, Florence," "Amiens Cathedral," and "Flower Market, Rouen," are

redolent of the suggestive style of technique which so pleases us in the work of Mr. Pennell, Mr. Railton, and a few besides. There is one curious defect noticeable in some of the drawings under review, and that is the slap-dash recklessness in portraying the railroads; *absolute* parallelism is such an elemental necessity that no craving for artistic indulgence can justify any unmathematical departure, and Mr. Pennell has simply rioted in nightmare treatment of the rails; though in "The Elevated," New York, he shows that he can be sober and rational.

COMPETITION NEWS.

BATH.—The Education Committee have decided to offer a premium of 50 guineas for the best competitive design submitted for the proposed Secondary School.

HUDDERSFIELD.—The result has been announced of a town-planning competition promoted by the Town Council for laying out four acres of land at Lindley, Birkby, Fartown, and Crosland Moor. The first prize of 100 guineas has been awarded to Mr. Alfred Hill, Thornton Road, Huddersfield; the second prize of 50 guineas to Messrs M. A. Piercy, W. H. Beeston, C. B. Thomson, and P. H. Solon, Stoke-on-Trent, who jointly sent in one set of designs; and the third prize of 25 guineas to Messrs. Hart & Turner, Sheldon Road, Nether Edge, Sheffield. The assessor was Mr. H. P. Boulnois, of London.

READING.—The Education Committee have formally approved the conditions of competitions and instructions to competing architects prepared by Mr. Ernest Newton, A.R.A., the assessor for the Kendrick schools buildings competition.

THE ARBITRATION CLAUSE.*

(Concluded from last week.)

V.—WHERE THE ARBITRATOR IS PRACTICALLY JUDGE IN HIS OWN CAUSE.

It is important to notice that *Belcher v. Roedean School Board* (*supra*) was decided on the principle that to have made the engineer arbitrator would substantially have made him judge in his own cause. Where, however, the matter in dispute is something in which the arbitrator is only indirectly interested, a reference to him would not be prevented.

It has been held that a mere expression of opinion in favour of one party is not sufficient reason to disqualify an arbitrator unless it appears that he has so made up his mind as not to be open to argument (*Jackson v. Barry Railway Company*, 1893, 1 Ch., 238). The following passage from the judgment of Lord Justice Bowen in that case is still good law: "It was an essential feature in the contract between the plaintiff and the railway company that a dispute such as that which has arisen between the plaintiff and the company's engineer should be finally decided, not by a stranger, or a wholly unbiassed person, but by the company's engineer himself. Technically the controversy is one between the plaintiff and the railway; but virtually the engineer on such an occasion must be the judge, so to speak, in his own quarrel. Employers find it necessary in their interests, it seems, to impose such terms upon the contractors whose tenders they accept, and the contractors are willing, in order that their tenders should be accepted, to be bound by such terms. It is no part of our duty to approach such curiously coloured contracts with a desire to upset them, or to emancipate the contractor from the burden of a stipulation which, however onerous, it was worth his while to agree to bear. To do so would be to attempt to dictate to the commercial world the conditions under which it should carry on its business. To an adjudication in such a peculiar reference the engineer cannot be expected, nor was it intended that he should come with a mind free from the human weakness of a pre-conceived opinion. The perfectly open judgment, the absence of all previously formed or pronounced views, which, in an ordinary arbitrator are natural and to be looked for, neither party to the contract proposed to exact from the arbitrator of their choice. They knew well that he possibly or probably must be committed to a prior view of his own, and that he might not be impartial in the ordinary sense of the word."

In a later case (*Freeman v. Chester Rural District Council*, 1911, 75 J.P., 132) the facts were as follows:—There a contractor brought an action to recover the price of certain works constructed for a local authority under a contract which provided for the reference of disputes thereunder to the engineer of the local authority. In answer to a summons to stay proceedings under Section 4 of the Arbitration Act, 1889, he challenged the conduct of the engineer in relation to the works, the question in dispute being whether the engineer had not precluded himself by his own admissions from saying that the works had not been completed to his satisfaction, and that the period of maintenance had not expired.

The Court (affirming the decision of Mr. Justice Lush), in the exercise of the jurisdiction conferred upon it by the Arbitration Act, 1889, refused to order the action to be stayed.

The Master of the Rolls said: "Corporations are, in my opinion, often too fond of putting officers of theirs in the position of engineers under a contract, and these officers forget that, as they are performing other duties to the corporation, there may arise a conflict between their duties in these other offices and their duties as engineers under the contract which may give rise to unfair treatment of the contractor by the zeal with which they perform their other duties. Of course, if you have exalted an officer of that kind as the arbitrator under the contract, you cannot say, merely because he is an officer, that therefore he is an unfit judge; but if facts subsequent to the contract have given rise to a substantial dispute in which there are allegations of continued unreasonableness on his part, and that is the real dispute between the parties, I think we should not be acting in the real spirit of the law if we shut the doors of the Court to such a dispute, and forced it to be referred

to arbitration." What they relied upon was his professional honour, his position, his intelligence; and the contractor certainly had a right to demand that whatever views the engineer might have formed, he would be ready to listen to argument, and at the last moment to determine as fairly as he could, after all had been said and heard.

VI.—WHERE THE PERSONAL CONDUCT OF THE ARBITRATOR COMES INTO QUESTION.

The cases already cited have this common feature: the conduct of the arbitrator himself did not form the subject-matter of any of the disputes. In certain recent cases, however, the Courts have laid down a very clear principle applicable in such circumstances. It seems that in considering the question whether a person who is the servant of one of the parties can act as arbitrator in a dispute, the Court will consider the nature of the question which he has to decide. In *Blackwell & Co. v. Mayor, &c., of Derby*, 1909, 75 J.P., 129, the plaintiffs had contracted to carry out certain tramway work for the defendant corporation. The engineer had given a certificate but had held back a sum of £1,500 under a penalty clause for delay. The company having brought an action, the corporation objected that under the arbitration clause the dispute must be referred to the arbitration of the engineer. To this the company objected on the ground that their case was that the engineer did not allow them to have proper facilities for proceeding with the work. The Court of Appeal refused to stay the action, Lord Justice Buckley saying: "The fact that the referee was the officer of the corporation was not sufficient ground, but the point is here that the contractor's case—whether true or not is a matter to be determined—is this: 'I could not complete my contract in time, and the reason why I could not complete it in time was that you, the contractual referee, were an unreasonable person. You hindered me in every conceivable way; you would not let me deposit my materials in such a way as it is usual to allow me to deposit my materials—in advance of my work—you placed all sorts of impediments in my way.' How could you expect him to say, if he is a person of any character at all, that the acts which he did were unreasonable acts? It is not human nature to suppose that he can properly determine that he himself is an unreasonable person. That is the subject of the dispute. . . . I think that there is sufficient reason why the matter should not be referred, being such as this is, to this particular gentleman."

To this extent, then, have contractors secured emancipation from the arbitration clause; but the principle laid down by the Court of Appeal is not likely to be extended. The Courts are very jealous of any interference with contract. The fact that this jealousy exists makes it impossible for a contractor to hope to escape the other obligations imposed upon him by the contract. If he has underestimated the amount of excavation necessary, or the amount of materials to be provided for completion, the fault and the loss will be his. Again, if he has under-estimated the time which the works will take, or if unforeseen circumstances for which the employers are not responsible have arisen to cause delay, the loss is the loss of the contractor. It is difficult to see how any of the losses arising from these causes can be avoided if the contractor has signed a contract which binds him hand and foot.

The most recent case on the subject which was heard by the Court of Appeal in March last, namely, *Aird v. Lord Mayor of Bristol*, Court of Appeal, 1912, shows that the Court will not extend, although it still adheres to, the principle above laid down. If the conduct or dealings of the engineer himself is in question, the matter will be taken from his hands. In that case the dispute arose under a contract entered into between the plaintiffs and the defendants, and dated March 17, 1902, for the construction and completion of a new wet dock at Avonmouth, an entrance lock, two entrance piers, a new wall, and other work in connection therewith.

The contract contained an arbitration clause referring all disputes arising during the progress, or after the completion of the works, concerning the works or their cost, or the quantity or quality of the materials, or in respect of any additions, omissions, alterations, or deviations made to, in, or from the works or any part of them, to the engineer having the superintendence and control of the works of the Docks Committee of the Council of the City of Bristol, who should be competent to enter upon the subject-matter of such dispute with or without formal reference or notice to

* A Paper entitled "The Effect of Recent Decisions upon the Arbitration Clause," by W. Valentine Ball, M.A., Barrister-at-Law, read before the Institution of Municipal Engineers in London.

the contractors or the corporation. The value of the work done and materials supplied under the contract was £1,923,977 9s. 4d., in respect of which the defendants had paid £1,752,761 10s. 11d., and the action was brought by the plaintiffs to recover the balance—namely, £171,215 18s. 5d.—and damages for breach of contract.

The summons taken out by the defendants for an order staying the action, so that the dispute between the parties might proceed to arbitration in accordance with the arbitration clause, was opposed by the plaintiffs on the grounds (*inter alia*) that the engineer had, by his conduct in his capacity as engineer under the contract during the progress of the works, rendered himself unfit to be arbitrator.

Lord Justice Vaughan Williams, after pointing out that there was nothing in the facts as disclosed to show that the engineer had been guilty of any misconduct, said that of all the matters which had been alleged against the engineer, there were really only two of any substance. As regards these they did not arise out of the original agreement between the parties, they did not fall within the schedule of prices where the price paid depended on the original schedule. The affidavits stated that specific agreements had been entered into, and that the engineer had departed from them. In such a case it was true to say that in so far as the engineer differed from the statement that agreements had been entered into and actually denied it, he was really acting as arbitrator in his own case. The question therefore to be determined was whether the engineer had in fact entered into these agreements, and whether he had departed from them. In his judgment, there was a strong *prima-facie* case made as to the existence of these agreements, as well as a *prima-facie* case of a departure from them. Putting it shortly, he was of opinion that in these two matters it was not desirable that the engineer should act as arbitrator. Under these circumstances, therefore, the appeal failed. In the event the trial was allowed to proceed.

The last case to which Mr. Ball referred was the decision of the House of Lords in *Roberts v. Hickman* (only reported in the second supplement to *Hudson's Building Contracts*). It was there held that the grant of a certificate by an architect will not be a condition precedent to the builder's right to sue, if, by writing letters to the employer, and allowing himself to be influenced by his views, the architect has disqualified himself from acting judicially, although guilty of no fraud or improper conduct.

It appears that in this case the architect had written to the contractor: "I regret I cannot enclose certificate, my clients' instructions being that the certificate I next give you is to be a final one, including for a complete settlement of the work done, into which I shall be prepared to go after Easter." He also wrote on another occasion: "Had you not better call to see my clients, because, in the face of their instructions to me, I cannot issue a certificate, whatever may be my own private opinion in the matter."

In this case, as will be seen from the above extract, the conduct of the architect as arbitrator was not considered; it was his conduct in relation to the grant of certificates which was under discussion.

The Court held in effect that he had so mistaken his position and lost his independence by listening to the employer that the grant of a certificate could no longer be considered a condition precedent to the contractor's right to sue.

VII.—SUMMARY OF THE CASES.

The contractor will not be compelled to submit to the decision of the employer's engineer as arbitrator (1) if the matter in issue is an unseemly personal dispute raising a vindictive feeling between the engineer and the contractor, and the engineer has so strongly expressed his view that it amounts to a prejudgment (*Nuttall v. Manchester Corporation*, 1893, 8 T.L.R., 513); (2) if the nature of the dispute is such that the cross-examination of the engineer is essential; (3) if the matter in issue is something outside the original agreement—*e.g.*, a dispute as to whether the engineer and contractor had agreed to vary the original agreement; (4) if the conduct of the engineer himself is practically the only point in dispute.

VIII.—SUGGESTED REFORMS.

Although there are probably hundreds of contracts now in force in various parts of the country in which the arbitrator is the engineer of the employer, circumstances may arise at any time which will prevent his acting when the time for his services arrives. Is it not therefore time to consider what alternative to adopt? Here are a few of them.

(a) *The Deletion of the Clause.*—Deletion of the arbitration clause would involve recourse to legal proceedings for the settlement of all disputes. Doubtless it might open a vista of litigation, and would therefore be rejected on that ground; but there is one fact in this connection which it is well to bear in mind—namely, that a dispute arising under a building or engineering contract would not come before the Court and a jury, but before a special referee (*i.e.*, an engineer appointed by the Court), or before an official referee. In the result the proceedings would be very similar to those which would take place before the arbitrator named in the contract. It is a trial of this kind which takes place if litigation ensues owing to the failure of an arbitration clause. Save that a reference to an official referee is reference to a lawyer, it very much resembles a reference to arbitration.

(b) *Reference to an Independent Arbitrator.*—Reference to an independent arbitrator appears to present almost if not quite as many objections as a reference to the Court. An independent person, even if he is an eminent engineer, has to be taught all about the nature of the work at the expense of the parties to the dispute. Witnesses to fact must be called in enormous numbers, while the expert witness, whose fees are considerable, must also be called at the expense of both parties. In the result the proceedings may drag on for days or even weeks. There are various ways of selecting an independent arbitrator. He may be named in the contract. If named, his independence may to some extent be affected by his being brought into business contact with one or other of the parties; but they would no doubt select a man who was not likely to have any such dealings with them. His appointment or selection may also be left to the President of the Institution of Civil Engineers for the time being, or to some other eminent personage. To leave it to a person who may happen to be president of an institution for the time being does not appear to be a very wise proceeding, inasmuch as the capacity of such person to select and appoint an arbitrator is a matter of pure speculation. It is much wiser, if it is desired to have an independent arbitrator, to leave him to be selected by agreement when the dispute arises, or, failing agreement, to be nominated by some eminent engineer of known capacity.

(c) *An Amendment of the Arbitration Clause.*—All the above proposals are open to the objection that they entail the expense inseparable from the appointment of an independent person. Numerous questions might arise in relation, say, to a sewerage contract, which could be decided by the engineer on the job without any objection being raised by the contractor. Suppose, for instance, the question was whether the cement supplied was capable of withstanding the prescribed tests. To have to refer such a matter to arbitration would be ridiculous. Again, the question whether a delay of, say, two days was justifiable could be decided in five minutes by the engineer who had been on the job, but could not be decided until after a long hearing by an independent arbitrator. Short of arbitration by the engineer "on the job," the next best thing is for the parties to retain their hold over the selection of the arbitrator by means of one or other of the above methods. At present the alternative to the arbitrator mentioned in the contract is the settlement of the matter in dispute by litigation. It would seem that by slightly modifying the usual form of arbitration clause the desired result can be attained.

The following suggestion may here be made: Frame the arbitration clause so as to leave the decision of every question arising under the contract to the engineer, but subject to a proviso that, should it appear to the Court on an application to stay any action or proceeding brought in relation to the contract that the engineer is disqualified from acting as arbitrator, the matters in dispute will be referred to an engineer, to be agreed between the parties, or, failing agreement, to be nominated by the President of the Institution of Civil Engineers. Another alternative is suggested by Mr. E. J. Rimmer, in his "Arbitration Clause in Engineering Contracts" (Constable & Co.). It is that, while preserving the finality of the decision of the engineer upon certain special points, a proviso should be added to the arbitration clause, stating that if any action is brought the defendant may either (a) have the action stayed and remitted to the engineer, or (b) have the matter referred to an independent arbitrator appointed in one or other of the manners above suggested. The same gentleman suggests that the decision in *Aird v. Bristol Corporation* (*supra*) may be got over by a new clause preventing the engineer entering into

any agreement with the contractors unless certain conditions are complied with. The actual wording of the clause would have to vary according to the other conditions of the contract and the circumstances of the case.

It might be argued that such an agreement would operate as an attempt to oust the jurisdiction of the Court; but it really would not have this effect. It simply means that the various steps above mentioned must be taken before the law courts can be asked to decide a dispute or refer a matter to an official or other referee.

IX.—CONCLUSION.

"It will be noticed," said Mr. Ball in conclusion, "that I have been compelled to base some broad general propositions on but a few cases. The fact that they are so few would seem to show that the demand for reform is not one of great exigency. But my researches in this matter have led me to think that what the local authority, which is responsible to the ratepayer, desires in relation to a contract is certainty. Certainty, so far as humanly possible in the matter of price and time; certainty that work shall be done under trustworthy supervision; and last, but not least, reasonable certainty that disputes shall be settled economically and expeditiously by a man in whom they have confidence. The suggestions I have put forward may, if adopted, avoid a good many of the pitfalls laid bare by the cases which I have cited. The actual conduct of proceedings in an arbitration is hardly within the scope of the present paper. I cannot, however, conclude better than by reminding him who is about to act as arbitrator of the duty of a judge. Lord Bacon, in his essay entitled 'Of Judicature,' wrote: 'Judges ought to be more learned than witty, more reverend than plausible and more advised than confident.' And again: 'Patience and gravity of bearing is an essential part of justice; and an over-speaking judge is no well-tuned cymbal. . . . The parts of a judge in hearing are four—to direct the evidence; to moderate length, repetition, or impertinency of speech; to recapitulate, select, and collate the material points of that which hath been said; and to give the rule or sentence.'"

Mr. Frank Latham, President, proposed a very hearty vote of thanks to Mr. Valentine Ball for the great amount of pains, time, and thought bestowed upon the preparation of his admirable paper.

Mr. H. Boot, in seconding the vote, said that as an engineer he had on many occasions stood in the position of arbitrator, expert witness, and also as defendant and plaintiff. He could therefore from his own experience testify that very largely what Mr. Ball had described in his paper did take place. In his own opinion engineers, especially when acting for corporations, were not the right persons to be appointed arbitrators. Unfortunately that position was thrust upon them by the town clerks. It was held that this was the only way to avoid litigation—and that in itself was, of course, always a good thing to do.

Mr. H. Percy Boulnois claimed some knowledge of the subject because he had been surveyor of Exeter, Portsmouth, and Liverpool. The usual arbitration clause making the engineer an arbitrator was, to his mind, a mistake. There were engineers and engineers; some of them started with the idea that a contractor was like a poacher, and that the surveyor should play the part of a gamekeeper. If that was so, was it fair for the engineer to act as arbitrator? Would it not be better for an independent person to be appointed? It seemed monstrous that a contractor should sign a contract containing such a clause as that, for he was binding himself down to the engineer not only as a master during the execution of the work, but also as arbitrator upon his own doings. The contractor always had great trouble to prevent the engineer from so acting. To do this it was usually necessary to prove the engineer had some sort of bias. Hitherto the Courts had been shy in throwing out the engineer as arbitrator. Points might arise in the mind of an independent arbitrator which would escape the minds of both parties. Again, a number of legal points arose in disputes. The engineer was not a lawyer; neither was the arbitrator perhaps; but the latter could call in the assistance of a legal assessor. The Official Referee was nearly always a lawyer. It was, however, much more difficult for witnesses to explain technical points to a layman. He (the speaker) therefore held that if there was to be a reference at all it was far better for it to go to an expert engineer than to an Official Referee. The cost of arbitration was not as a rule very large unless very big sums were involved. The paper was, he considered, a most valuable

one, and it had given him a number of hints as well as a great deal to think about.

Mr. A. J. Martin said his own experience had been first as a subordinate municipal engineer and then as a consulting engineer. A consulting engineer was less liable to pressure from any one of the many municipal authorities he worked for than a municipal officer who gave his whole time to one. Many authorities entertained mistaken ideas of the position of the municipal engineer who was carrying out work for them. They considered he was acting as their servant and that it must be his business to give effect to any of their views with respect to the contract. It was necessary for the engineer to disabuse their minds of that by making it clear that he was not their servant, but one who had to deal out even-handed justice between the parties. The consulting engineer could snap his fingers at the local authority. However, the engineer possessed one important qualification for the position of arbitrator in his intimate knowledge of the progress of the work. Contractors were not only ready but willing to accept the arbitration of the engineer under whom they were working, and in nineteen out of twenty cases they were satisfied with the award. That, he thought, was a high and well-deserved tribute to the fairness and impartiality of the engineering profession; he was firmly convinced there existed no body of men with a higher sense of professional conduct. It would be a mistaken policy to do anything to detract from the responsible position of the engineer unless there was grave reason for so doing, for it was that sense of trust which had elevated the profession to its present position. It was, however, only fair to give the contractor a final court of appeal.

Mr. A. E. Strickland believed the fairest way of dealing with a contractor was to meet him in an honest, straightforward way. Personally he did not like the surveyor as arbitrator of his own scheme; in some cases it might have a satisfactory result, but it might also lead to trouble. It seemed to him that they should look forward to the formation of an Association of Arbitrators.

Mr. J. R. Fayers could not agree that the lawyer element should come into cases of arbitration, as he believed the arbitrator should really be of the profession to which the matter dealt with belonged. It was much easier for such a one to grasp the whole circumstances. There were, of course, legal aspects of a case which a lawyer might be required to clear away.

Mr. C. Biggs said he had come to the conclusion that directly they talked of extras they began to talk of the inexperience of the engineer. If they could have a perfect design—as for a building—they were all right. But the architect and the builder were in a different position to the engineer and the contractor. In the former class of work there should be no extras, for everything was known from the foundation to the roof. But there was no engineer in the world who could say he was going to work out a perfect design, for directly the work commenced there would be changes. Who was to arbitrate as to whether such changes were necessary? He always thought the main question that the engineer of the work had to decide was whether the work was carried out satisfactorily and with satisfactory materials. If there had been changes the cause of these changes should be left to an arbitrator. He had known scores of instances where there was no trouble; but cases arose where an independent authority must be appointed to decide the differences between the parties.

Mr. Frank Latham, the President, said a good many engineers and architects seemed to think that a contractor had to be watched as a cat watched over a mouse. But a contractor was of considerable value to the engineer, a great deal more valuable than the builder was to the architect where the work was straightforward. The difficulties in an engineering contract were more than could be seen at first glance. The contractor took the whole burden on his shoulders; it meant very hard work and great anxiety. Every engineer ought to feel very much gratified that there were contractors who would come forward and tender for his work. It was, of course, to the contractors' advantage to execute the work satisfactorily. Otherwise his name was spread broadcast to the detriment of his business.

The vote of thanks was then passed.

Mr. W. Valentine Ball having replied to the points raised, the meeting terminated.

THE Hull Education Committee have instructed the City Architect to prepare plans for an open-air school at Dairy-coates.

WATER-COLOUR DRAWINGS BY MISS EMILY PATERSON.

Nor for the first time in the course of our peregrinations have we found that greater interest attaches to what is not the subject of invited inspection than to the latter. This is the case respecting Miss Paterson's collection of water-colour drawings in France, Switzerland, and elsewhere, now on show at the McLean Galleries. For after a careful survey of these works it was a sensible relief to wander into another room and to view a miscellany of pictures by Continental artists. We may regret this, as our chivalrous instincts lead us to the desire ever to speak well of ladies and of all they say and do; but there is, unfortunately, so little to be said in favour of the present Exhibition. Perhaps a severe critique may be condemned as unwarranted, where about thirty per cent. of the works admit of praise of some kind; but we fear that our desire to strain a point here and there may be partially accountable for raising the percentage.

Speaking really critically, only eight—or perhaps nine—out of the fifty-three studies satisfy, and even these not completely. The keynote of the Exhibition is woolliness of technique and lack of inspiration in treatment. "Lauterbrunnen" is decidedly worthy of inspection, with its snow-clad slope, well-suggested snow-laden skies, and sympathetically touched-in pine trees. "The Maas" is a bright and pleasant piece of composition, a quality unfortunately conspicuously absent in general. Again, "Becalmed" and "The Green Ship" merit attention, but Miss Paterson is not an adept at depicting water. "Sunset" shows an extremely clever sky, where the suggestion of the sun behind the dark strip of cloud is effectively portrayed, and where the lapping blue waters are better than in most instances. And this latter criticism, too, may be offered in regard to "Boats, Douarnenez" (26), which is a nice and bright morceau, the boats and the "distance" also being well managed. "Nieuwe Haven, Dordrecht," is easily one of the best in its realism, brightness, atmosphere and colouring.

But the undoubted best, the picture without a rival claimant, is "Moonlight" (50), an excellent little piece, though even here the water is not a success, looking more like a country roadway. "Bernese Oberland" (49) and (13) are clever, but are not equal to "Lauterbrunnen." We might, in conclusion, refer to "The Thames," where the neutral toning is good.

As for the rest, we can but say that, regarding landscape and seascape and architecture, the effect generally is poor and the technique unsatisfactory.

DRAWINGS AND STUDIES BY OLD MASTERS.

Messrs. DOWDESWELL & DOWDESWELL, of New Bond Street, have now on exhibition the third series of sketches by old masters, including the school of Clouet. It is safer to talk of the latter's "school," as very few (if any) of the exhibited works are identified as the actual production of Clouet himself. There is, of course, a large section of the public which delights in seeing the seedlings from which were grown the fruits of genius, but our own interest has ever been languid in this respect, when the seedling takes the form (as is too often the case) of a multitude of rough, scratchy lines, which a child trained on the Ablett system would laugh to scorn. When, however, as with such work of Vernet's, the studies may be considered in the light of portfolio sketches, it is different. Vernet's studies of trees here exhibited are both of them sympathetic. And Boucher's study of a nymph (in sanguine) is delightful, and is redolent of the finished Boucher. Largillière's portrait group of "Two Young Noblemen with a Dog" is one of the best exhibits.

The school of Clouet is represented by twenty portraits in pencil and wash, with chalk as an additional medium in eleven instances. Being contemporary with the wearing of a neck-ruff, there is a sameness in general effect, heightened by the almost invariable monotony of treatment in regard to the ladies' delicately tinted faces. Nor is this effect much disturbed by sundry markedly character-differences in these faces; all would seem to indicate good portraiture, that of the Princesse de Condé being very charming, and the piquant expression on No. 5 proving attractive. The three portraits of noblemen are stronger in touch than the rest. The technique is altogether suited to the class of subject.

Of the Italian school there are thirteen works. A portrait of a boy by Parmigiano is an uninteresting outline profile in water-colour, but this artist is more pleasingly represented by a "Virgin and Child," a forcible little sketch

in pen and wash. Francesco Guardi is in evidence with a slight sketch of a Palace staircase; nowadays out of the ordinary, but still fairly suggestional. A seventeenth-century auto-portrait of a young painter, executed in black and red chalk, is sufficiently vigorous. It is always difficult to produce earth-worm designs, as portrayed on overhead surfaces, but the sixteenth-century sketch in gouache for a painted dome is distinctly effective, with its figure-groups on thick branches of trees. "St. Michael Destroying the Demon" (attributed both to Dosso Dossi and Lelio da Novellara) is pictorial and well-composed, but the demon looks entirely undemoniacal. "Christ Scourged" (Early North Italian), a pen and sepia-wash drawing, shows the martyr too dwarfed in proportion. "Christ and Satan" (attributed of old to Silvestro Doni), in pen and wash, is satisfactory in composition.

The Dutch and Flemish schools are represented by a similar number of works. Vandyke's "Adoration of the Magi" is an excellent pen-and-ink sketch, and (as might be expected) composes well. Langendyk's "The Siege" is one of the best on exhibition, and is full of verve. Oostsamen's "Adoration of the Magi" is an effective composition in black pencil heightened with white executed on very dark brown paper.

Five drawings are from the Swiss school. We are not attracted by "The Supper Party of a Guild," where the figures are all portraits, and generally give the appearance of posing; the whole effect is stiff. Tobias Stimmer's title-page design is an elaborate composition with virile technique. H. Nüscheler's "Daniel and the Lions" is very decorative, and his "Mary Magdalen Anointing the Feet of Christ" is a satisfactory piece of grouping.

The catalogued exhibits of the English school are few in number and not very interesting, though some of the Gainsborough landscapes are passably attractive. But the whole exhibition is not inspiring.

THE PICTORIAL POSSIBILITIES OF WORK.*

Work to-day is the greatest thing in the world, and the artist who best records it will be best remembered. Work has always been an inspiration to artists from the time when we were bidden to earn our bread by the sweat of our brow, till now, when most of us are trying to forget the command, and live like ladies and gentlemen.

Under the Church work the building of the Tower of Babel and the Temple were the subjects of endless imaginings by painters, sculptors, and graveurs who never assisted at the functions they illustrated. Painters who sat in their studios hundreds of years after the towers and temples were designed and destroyed have showed what they imagined the towers and the temples looked like. This—this sort of creation or invention—we art students in America called "genius work" because it was "done out of our heads." In Europe it is called "scholarly," and is concocted from a classical dictionary; a trip for a few weeks to Greece or Italy is useful but not necessary, and adds to the expense; illustrated postcards may be used instead.

Now educated people, cultured people, take such painters seriously—and pay shillings to sit in darkened chambers and brood. These are carefully but sadly illuminated, and the spectators pursue with diligence, scarce looking at the exhibits, the remarks of critics who prove conclusively that these painters show exactly what the world was like, what buildings were like and how they were built, and how the builders worked according to the bookman and archæologist.

Now as to these popular forms of art—the backbone of academies, the source of shillings—I know, for I am an academician—I have nothing to say. The results, in a few instances, have been works of art because of excellence of technique. But the man with the greatest imagination is the man with the greatest information about his own surroundings, which he uses so skilfully that we call the result imagination, and this is the way the greatest art of the world has been created.

I am not disputing the power, in their day, nor the charm they still have—for the very few who understand—of Cimabue, of Giotto, of the painters of the Campo Santo at Pisa, when they painted the subjects I have mentioned, nor of Pintoricchio—he put work in the background of his paintings, as Dürer did in his prints. There are compositions by Bellini and Carpaccio which show they studied work. It is strange, so far as I know, that Leonardo ignored

* A Paper by Mr. Joseph Pennell, read before the Royal Society of Arts on December 18.

MODERN EUROPEAN ARCHITECTURE.
NORWAY.[From *Arkitektur og Dekorativ Kunst*.

DINING-ROOM FURNITURE, IN INLAID MAHOGANY.—MR. CARL BERNER, Architect.

work—in his pictures—he who was such a great workman. But, with all these artists, either work was a detail or imaginative; it was never the dominant motive, never a study of work for work's sake.

The first artist I know of—though I am not an art historian—to see the pictorial possibility of work, the Wonder of Work, was Rembrandt.

Rembrandt saw that his father's mill was beautiful, and by his renderings of the windmills and the dykes of Holland proved them the great works of his little country, and showed they were pictorial. And he drew, etched, and painted them because he loved their big powerful forms, their splendid sails, the way they lorded the land and kept out the sea. They were for him the Wonder of Work, the wondrous works of his time, the works that were all about him. So strong and so powerful were these Dutch works that they have lasted till to-day, and so well were they designed that all windmills and watermills have kept their form till now. The working parts have possibly been improved, but the design has not been changed, and Rembrandt's etchings—so accurately drawn they would serve as working models—prove it. And yet Rembrandt has made a perfect artistic composition as well as a true mechanical rendering of these mills and dykes. And as Whistler said in the "Ten o'Clock," the Bible of Art, Rembrandt regretted not that the Jews of the Ghetto were not Greeks, nor did he regret the windmills were not temples.

Then came Claude and found the Wonder of Work in commercial harbours, dominated by necessary lighthouses, and in the hustling cities of Civita Vecchia and Genoa—for it is amid the work, the life of one's own time, that the Wonder of Work is to be found.

Canaletto followed, and saw in the building of Venice the same inspiration that Tintoret found in her history, Titian in her great men. And Piranesi discovered the prisons, the Carceri, to be as enthralling as the ruins of Rome.

Turner imitated Claude. Claude saw his subjects about him; Turner used Claude's motives and tried to rival his predecessor. Claude painted what he had seen in his own time; Turner tried to reconstruct his unconscious rival's facts out of his head, and failed even in his rendering of

work about him, signally in "Steam, Rain, Speed," where an impossible engine conducts itself in an incredible fashion in a magnificent landscape. Turner was not here trying to carry on tradition—the only thing in art—but to *embêter les bourgeois*.

Turner's Carthage would not stand up if built—Claude's palaces do. Turner, too, defying Ruskin—Ruskin anathematising workaday England—was a spectacle. But Turner was sometimes in the right, with Constable and Crome, and they, and not Ruskin, have triumphed. Turner had magnificent ideas, wonderful colour sense, grand composition. But when he came to fact he was often ridiculous or pitiful, simply because he had not observed work, noted facts—and to paint work one must study work.

It is far easier to paint a heavenly host or a dream city in one's studio than to make a decoration out of a group of miners, or to etch a rolling mill in full blast. Yet one can be as noble as the other, as Whistler proved when he showed for the first time how in London "the poor buildings lose themselves in the dim sky, and the tall chimneys become campaniles, and the warehouses are palaces in the night, and the whole city hangs in the heavens, and fairyland is before us." This is the Gospel of the Wonder of Work.

Though I never studied under Whistler—never was his pupil—he is and always will be my master—the master of the modern world, the master who will endure because he glorified the things about him, the things he knew, by "The Science of the Beautiful." What are the Thames etchings—"Wapping," "The Last of Old Westminster," "The Nocturnes"—but records of work?—a fact most critics have never realised. But Whistler was a many-sided—a so many-sided genius that his many essays in many fields are only just becoming known, and this study of work—the most difficult study in the world, under the most trying conditions—was abandoned by him, but not till he said what he wanted in the ways he wanted, not till he had made a series of masterpieces which live and will live for ever.

But there was a man—all the great have gone from us in the last few years, which accounts for the momentary notoriety of the small—there was a man who gave his later life to the Wonder of Work—Constantin Meunier. Listen.

"Un jour—Meunier approchait déjà de la cinquantaine—Camille Lemonnier l'emmena dans le Hainaut: il devait y faire quelques illustrations pour *La Belgique*. Ce voyage de Meunier à travers le Borinage lui fut une révélation. Il s'y découvrit lui-même, il y découvrit son art. Dans ce sombre paysage de fumée et de feu, dans le haletement formidable des fabriques, parmi les farouches mineurs et les puddleurs et les verriers, toute une humanité damnée à la peine, son âme tragique s'emplit de cette pitié et de cette admiration qui devaient résonner à travers tout son art. Il avait conquis son propre domaine.

"Meunier a conquis à l'art la beauté spéciale de la nouvelle industrie: la formidable fabrique, pleine de lumière sombre et de tonnerre, les fêtes flamboyantes des fonderies, la puissance grondante des machines. Et toujours cette tendance est au monumental.

"L'hymne au Travail chante avec plus de force lyrique encore dans ses bronzes."

With Whistler it was all in the day's work; with Meunier it was his life work, and the life of his world, the worlds, as with Whistler, around him, for that is best which nearest lieth. Courbet in work had influenced Legros and Brett and Millet and Segantini, and I have no doubt Ford Madox Brown, the man too big to be a pre-Raphaelite, whose biggest picture is work—"Work in London"—the man who will one day make Manchester a place of pilgrimage because of his pictures of work and of war.

The Japanese count for a little. Repine and De Nittis, Bastien Lepage, Tissot, Ridley, and, above all, W. L. Wyllie have shown the Wonder of Work, the last on the Thames; and hundreds of imitators of these men have starved peasants, herded kine, rowed boats, and sat in harvest fields, because they thought it the correct thing to do, or else that they could work the sentimental, pathetic, socialistic game as a diversion from mummy's darling baby and the mustard-pot, dear little doggie, or poor old Dobbin. I do not mean to say there have not been, there are not, artists who have cared for the work and workers of the fields for their own sake: there are some; but I wish to speak only of industrial work.

Meunier showed without sentiment the workman at work, not with any idea of preaching about his wrongs, his trials, his struggles, his misery, but to show the Wonder of Work for its own sake, and the pictorial possibilities of workmen and workwomen in Belgium. Meunier showed that the workman was worthy of the artist's chisel, chalk, needle, and paint. There is no sentiment about Meunier; there is grandeur, dignity, and power, and from him we have learned that modern work is wonderful. Meunier was an old man when a few years ago I first heard of him and saw his work. He had then done his heroic Antwerp and his puddlers and miners in bronze, his paintings and his chalk drawings, his decorations, his great apse for the unbuilt basilica—the monument to modern work and workers. His work is decorative because it is true, and this brings up another side of the Wonder of Work. In France, Germany, and Italy the Wonder of Work around us has been made the subject of endless commissions from the State to artists mostly realistic. But records of facts, facts of one's own time, here and in America are never recorded. Go to the Royal Exchange and you will find Wat Tyler, Phœnicians, prehistoric apple-carts, and everything in the history of London that can be made into a painting of the past, and not a single record of the present. Where is the building of the Tower Bridge, the electric light works, the docks, the Black-wall Tunnel, the trams, the tube, or any of the other works by which this age, this workaday age, has distinguished itself, all of which are worth painting? In America we have imaginings of Holy Grails, Pied Pipers, Religious Liberties, when one fact in decoration about steel-works, sky-scrapers, or the Brooklyn Bridge would be worth the lot in the future, when these factless fancies are white-washed out, or made a good ground to paint on. In France men like Henri Martin have painted decoratively, yet realistically, the harvest of last summer; and Puvis de Chavannes, first of all, magnificently showed the way to combine the old decoration with the new realism. His life work at Amiens is pure convention, so are his designs in the Boston Public Library and in the Sorbonne, but they are the most perfect examples of decorative, imaginative, conventional work in the modern world.

But at Rouen and Marseilles he has treated decoratively modern subjects, or, rather, he has used modern motives. At Rouen, the city with its spires and chimneys, its new bridges, as seen from Bon Secours, prove the Wonder of Work; in the foreground are modern figures, greeting the Spirit of old

France. At Marseilles there are two subjects in which symbolism and realism, modernity and work are harmonised—the most difficult problem to solve—but Puvis has solved it, and proved himself the greatest if not the only decorator since Piero della Francesca, the supreme master of decoration. Raphael, in the Stanze of the Vatican, was a decorator of his own time, and so was Pintoricchio in the Library at Siena, and Mantegna at Padua, for they made decoration out of the life about them.

And here John Lavery has made, in Glasgow, a decoration out of shipbuilding which is worth the whole wall coverings of the Royal Exchange and the House of Lords put together. There is, I know, the Graves Brothers' work at Streatham—only no Streatham is in them; and some others have done things in South London, which are scarcely of South London, but some are amusing. But decoration is a difficult matter, and Lavery has done much for Glasgow. And I hope something more will be done in Chelsea Town Hall. And Moira has shown his power in various places.

From the very beginning I have cared for the Wonder of Work; from the time I built cities of blocks and sailed models of ships to them across the floor in my father's office, till I went to the Panama Canal, I have cared for the Wonder of Work. There are others who care—Brangwyn has cared, and so have Santer, Muirhead Bone, and Strang. Way, Cameron, Bone, and Brangwyn have cared for the building up and the breaking down, and Brangwyn for life—the life of the workman, possibly because of his Belgian and sea-faring education or his knowledge of Meunier, his countryman. And there are Belgians like Baertsoen, and Frenchmen like Lepere, Gillot and Adler, and Italians like Sartorio, and the great German Menzel.

But it is to America we must turn, and here Seymour Haden's "Breaking up the Agamemnon" is notable; to White's etching of Brooklyn Bridge, Cooper's sky-scrapers, Alden Weir's New York at night, Childe Hassam's high buildings—to these one must look for the modern rendering of work. I have tried to do what I could in New York, Chicago, San Francisco, the coal mines of my native State—Niagara—and at Panama; and whatever their worth, I can only, to end with, tell you and show you the Wonder of Work as I see it.

New York, as the incoming foreigner, full of prejudice, or doubt, or hope, and the returning American, crammed with guide-book and catalogue culture, see it or might see it, rises a vision, a mirage of the lower bay, the colour by day more shimmering than Venice, by night more magical than London. In the morning the mountains of buildings hide themselves, to reveal themselves in the rosy steam clouds that chase each other across their flanks; when evening fades, they are mighty cliffs glittering with golden stars in the magic and mystery of the night. As the steamer moves up the bay on the left the Great Goddess greets you, a composition in colour and form, with the city beyond, finer than any in any world that ever existed, finer than Claude ever imagined, or Turner ever dreamed. Why did not Whistler see it? Piling up higher and higher right before you is New York; and what does it remind you of? San Gimignano of the Beautiful Towers away off in Tuscany, only here are not eleven, but eleven times eleven, not low mean brick piles, but noble palaces crowned with gold, with green, with rose; and over them the waving, fluttering plume of steam, the emblem of New York. To the right, filmy and lace-like by day, are the great bridges; by night a pattern of stars that Hiroshige never knew. You land in streets that are Florence glorified. You emerge in squares more noble than Seville. Golden statues are about you, triumphal arches make splendid frames for endless vistas; and it is all new and all untouched, all to be done, and save for the work of a few of us, and we are Americans, all undone. The Unbelievable City, the city that has been built since I grew up, the city beautiful, built by men I know, built for people I know. The city that inspires me, that I love.

I went to Panama because I believed that, in the making of the greatest work of modern time, I should find the greatest inspiration.

This is the day and the time of the Wonder of Work. Within a few years, with the coming of electricity, the mystery of work, the smoke revealing, concealing mystery, will have rolled away for ever. And to-day the greatest works that man has ever undertaken are in progress. So I started on a trip of 15,000 miles in search of the most wonderful Wonder of Work.

The day I landed in Colon I found it. I had seen great cranes at Pittsburg and Duisberg, but nothing like that which stretched its great arm, with great claws, over the sad, silent swamp of Mount Hope—the debacle of De Lesseps'

MODERN EUROPEAN ARCHITECTURE.
SPAIN.

A GARDEN-SUBURB HOUSE, VILLANUEVA, BARCELONA.—Don BUENAVENTURA POLLES, Architect.

ambition. I had seen in New York, as I sat on the thirtieth storey of the Metropolitan building, a chain come up from below with a man clinging to it. But I had never imagined anything like the group of figures which rose out of Gatun Lock at dinner-time. I had looked into chasms and gulfs, but I never imagined anything so terrific as the gates of Pedro Miguel. I had seen the greatest walls of the oldest cities, but I never imagined anything so imposing as the walls of Miraflores Lock. I had seen the great aqueducts and great arches of the world, but I never imagined anything like the approaches to Gatun and the spring of Pedro Miguel, made by army officers and civil engineers mainly to save material. For there are no architects, no designers, no decorators on the Panama Canal—just engineers and organisers—Goethals, Gaillard, Gorgas, Williamson, Bishop and more. But the engineers at Panama are great designers, and great work is great decoration.

Almost before I left the Canal, artists, architects and decorators were on their way there. I hope it may interest them half as much as it interested me.

I have tried in my lithographs of the Canal to show some of the things I saw this spring, but in the few weeks I was on the Isthmus many changed and disappeared for ever. What I did is a record of what I saw. Not that I came anywhere near exhausting the subjects—in every part of the Canal compositions may be found. I merely tried to draw the things I saw when I saw them—squatting on my sketching-stool where I could, or when I could, or on an iron girder, in the cab of an engine, a telephone box, on the top of a crane. I only refused to be suspended in a bucket a hundred feet in air over one of the locks, as I was invited.

Had I not had my previous experience in trying to draw work, I could not have done even what I did, but the study of great architecture is a great aid, for the locks are architecture. The workmen I hardly touched—they are details in

the Wonder of Work they have created. Where the work is fiercest, there the fewest workers are to be seen. It is only when they knock off you see that thousands are at it.

The mountains crowned with strange trees, the long level lines of cloud—I always believed to be an invention, or a convention of the Japanese—that hang motionless before the hills, the impenetrable jungle, the native villages, were motives without end, maybe only for me.

Panama City is as picturesque as a Spanish city, and as full of character; it has yet to be lithographed, etched, drawn or painted. There are churches, courtyards, balconied streets, forts, shops, gardens, ruins—a whole ruined city—all waiting the artist who has not yet come, though he is on the way. I wonder Whistler made no record of them on that unexplained trip of his across the Isthmus. But I went to draw the Canal. I had no time for anything else, though some of the vistas under the royal palms of Ancon Hill, looking down on the town, the Pacific beyond, are as fine as the Bay of Naples. And from the sea Panama is very like Naples.

But the Canal called me.

On the Canal I found the subjects I wanted—subjects I shall never find again, and it will always be a delight to me that I went—went on my own initiative and not at anyone's bidding. If my drawings have interested my own country and countrymen, and others' countries and countrymen, it is the greatest honour I could ask, and to have done some little thing with and for the great men who have made the Canal, to have done something to record what they have done, and to have interested them, is far more than I ever expected. I shall probably never see the Canal again, but I have seen it and drawn it as well as I could, and I am glad I went, for it is the most wonderful Wonder of Work in the world.

We have recently been told that art will disappear in fifty years (by a person who says he will call his last book—

with possible appropriateness—"Vale"). But though he will disappear, and Post Impressionism will be swallowed up in shopkeeping, and though the mustard pot has gone with the soulful doggie, and the tearful baby rival of the Dresden Madonna, the artist who has something to say in his own way about his own time, and can say it, will live, and his work will live, with Rembrandt, Velasquez, Franz Hals, Meunier, and Whistler—artists who painted and drew the work and life about them and never regretted the past. And art which shows life and work will never die, for such art is everlasting, undying. "The Science of the Beautiful"—it is the Wonder of Work.

HENRY SAXON SNELL PRIZE.

THE subject given by the Royal Sanitary Institute in 1912 for the essay in competition for this prize was "The Ventilating, Lighting, Heating, and Water Supply Appliances and Fittings for an Operating Room for a General Hospital."

Ten essays were sent in, and they have been brought under the consideration of the Council.

The adjudicators for the competition were Mr. Edwin T. Hall, F.R.I.B.A., Dr. Louis C. Parkes, and Mr. A. Saxon Snell, F.R.I.B.A., and they had the advantage of the very valuable criticisms and suggestions made by Sir Frederick Treves, Bart., G.C.V.O., who acted as consulting referee.

Acting upon the advice of the adjudicators and of the consulting referee, the Council have decided to divide the prize of fifty guineas, giving one-half the sum to Mr. John Darch, M.R.San.I. (Wandsworth), writing under the motto "Aseptos," and the other half to Mr. H. F. V. Newsome (Manchester) and Mr. John G. Cherry, M.R.San.I. (Manchester), writing jointly under the motto "Magnum Bonum."

The adjudicators consider that there are many excellent suggestions in each of these essays, but, on the other hand, there are some which they consider would prove unsatisfactory in practice.

A bronze medal of the Institute will be awarded to each of the successful competitors.

The adjudicators also desire to commend the essays sent in under the mottoes:—

"Science moves but slowly, slowly creeping on from point to point."

"Ajax."

"Tout bien ou rien."

DRAWINGS AND PAINTINGS BY MR. HAL HURST, R.I., R.B.A.

At the Carlton Studio Galleries, Great Queen Street, there is just now an interesting display of work by that versatile artist, Mr. Hal Hurst. We say "versatile," for though the typical young lady reminiscent at once of Mr. Hurst and Mr. Dana Gibson is largely in evidence, yet our artist is able to produce work far removed from that same type.

In the absence of a catalogue, it will not be possible to any great extent to refer to the exhibits in detail. We noticed a series of "The Seasons," showing a nude female alone on the globe, and predominant to an exaggerated degree, but the varying and sympathetic colour-treatment in relation to the successive seasons is delightfully worked.

Two points are particularly worthy of notice in Mr. Hurst's art, and these are the extremely delicate colour, loved by him (though he can be forceful enough where he desires), and the entire refinement which he exhibits in dealing with his subjects. And, too, he is an adept in posing his figures and in giving them swing and action. His forte lies in the apotheosis of man's divinity, and this he obtains in two-fold fashion—namely, by the tête-à-tête presentation of the eternal feminine, charmingly portrayed, and the equally eternal masculine to act as a foil.

There are some vigorous portraits on show and a few genre works; one of these is in the style of Mr. Marcus Stone, R.A., and another, "The Pawnshop," suggests pathos, though not deeply pathetic in treatment.

It is a frankly commercial exhibition, but is none the less full of interest. On leaving there is a sensation that brightness and cheerfulness, all-pervading in their nature, have enveloped us whilst viewing the works, and are still enveloping us as we walk away and plunge into the murk of an autumn afternoon in the metropolis of the world.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Walls of Visby.

SIR,—The Architect of yesterday did me the honour of reporting my vote of thanks to Mr. Horace Porter for his excellent lecture last Monday on "The Walls of Visby." I was stated to have said I was a native of Scotland. What I said was "a native of Gotland." The sound of the two names, being so much alike, was, of course, the cause of the mistake on the part of the reporter. I must be content with being a Gotlander or a native of Gotland, a Goth or a Northman, in fact.

Sorry to trouble you with these remarks.—I am, yours very truly,

ALEX. H. HAIG.

Haslemere, Surrey: December 21, 1912.

Workmen's Houses Competition, Wellington, Salop

SIR,—Will you be good enough to publish the enclosed reply from the Clerk of the Wellington Urban District Council in answer to a letter from the Shropshire Architectural Association, in which it was pointed out that no member of the Association could compete under the terms of their competition for workmen's houses as advertised.

The terms offered are £10 premium, no assessor, and no intention to engage the successful competitor to carry out the work.

Will you kindly make some comment on the letter from the Clerk and on the conduct of the Council in attempting to promote such a competition? Perhaps you will also warn intending competitors that to send in designs under such terms is to be guilty of unprofessional conduct.—I am, yours faithfully,

FRANK H. SHAYLER, Hon. Sec.

The Shropshire Architectural Association.

16 Pride Hill, Shrewsbury: December 23, 1912.

(COPY.)

Wellington (Salop) Urban District Council.

Clerk's Office, Bank Chambers, Wellington,
Salop: December 21, 1912.

To F. H. Shayler, Esq., F.R.I.B.A. (Hon. Sec., Shropshire Architectural Association), Shrewsbury.

WORKMEN'S HOUSES COMPETITION.

Dear Sir,—I am in receipt of your letter of the 18th inst. this morning, which I have shown to the Chairman of the Council, as requested. Now that the competition has been advertised and a number of architects all over the country have applied for copies of the particulars, and are, presumably, at work on the plans, I cannot see how any change can be made at this late hour, even should the Council be willing to do so. You must surely allow those who arrange the competition to draw up their own conditions, and you should not have any reasonable cause for complaint because those conditions do not fall in with the views of certain would-be competitors who desire to have the conditions altered to suit their personal views.

I would remind you that the competition is not arranged for the benefit of competitors, but for the benefit of the Council. Whether the architects in the county (members of your Association) compete or not is entirely a matter for themselves to decide. There is nothing in the conditions to lead anyone to suppose that the Council will not be advised by a competent assessor or adviser (if the Council thinks proper), but the ultimate result must be by resolution of the Council; you may, however, take it definitely that the Council has decided that it will not bind itself to employ the successful competitor to carry out the plans, or even to carry out the plans at all.—Yours faithfully,

(Signed) J. W. LITTLEWOOD, Clerk.

THE Newcastle Education Committee are informed by the Buildings and Equipment Sub-Committee that the plans for the new Cruddas Park and Rye Hill Schools have been selected. They are to be sent to the Board of Education for approval.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CANADA.—Oct. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARDIFF.—Aug. 6.—The Corporation invite designs and estimates in competition for a fire brigade station proposed to be erected in Westgate Street, Cardiff. The Corporation have appointed Mr. A. Marshall Mackenzie, architect, to act as assessor. The deposit of £2 2s. will be returned to all architects submitting bona-fide designs or who return the conditions within six weeks. Full particulars of the competition will be sent to the architects on application to Mr. J. L. Wheatley, Town Clerk, City Hall, Cardiff.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—July 12.—For erection of a laundry, chimney, &c., at the district infirmary. Messrs. W. H. George & Sons, architects, 7 Warrington Street, Ashton-under-Lyne.

BARROW-IN-FURNESS.—July 15.—For the extension of the electricity works buildings, Buccleuch Street, for the Corporation. The Borough Engineer and Surveyor, Town Hall.

BECKENHAM.—July 22.—For the erection of caretaker's lodge, public conveniences, &c., in Kelsey Park. Mr. J. A. Angell, surveyor, Beckenham. Send £2 deposit to the Collector.

BEDFORD.—July 25.—For works of repair at the several Council schools, for the County Education Committee. The County Surveyor, Shire Hall, Bedford.

BERWICK ST. LEONARD.—July 18.—For the erection of a cottage and certain repairs to buildings at Berwick St. Leonard Glebe Farm, for the Small Holdings and Allotments Committee of the Wilts. County Council. Deposit £1 1s. Mr. A. Boa, county land agent, County Land Agent's Office, Trowbridge.

BIERLEY.—July 9.—For masons' and joiners' work required in the erection of verandahs at the City Hospital, Bierley Hall, for the Corporation. The City Architect, Town Hall, Bradford.

BIRTLEY.—For work in connection with boundary walls, fencing, gates, &c., at the recreation ground. Mr. P. L. Browne, architect, Pearl Buildings, Northumberland Street, Newcastle-on-Tyne.

MR. B. T. BATSFORD will publish in a few days a new and re-illustrated edition of Mr. Francis Bond's "Cathedrals of England and Wales."

MR. JAMES N. STIRLING, M.A., B.Sc., chief assistant surveyor, Clydebank, has been appointed burgh surveyor and water engineer of Helensburgh, at a salary of £200 per annum.

THE Duns Gas Company has decided to carry out extensive alterations on the gasworks, entailing a cost of about £2,000.

A ROMAN Catholic school is to be erected in Toulon Street, Camberwell. The total cost of the work, the plans for which have been passed by the Education Department, is estimated at £10,000.

THE Foleshill District Council have instructed their engineer to prepare plans, &c., and invite tenders for the construction of a brick storage reservoir with a capacity of 300,000 gallons.

THE Coventry Corporation's Sewage Farm Committee have in contemplation a scheme for the extension of the system of bacteria filtration, at an estimated cost not exceeding £40,000.

THE Hull Education Committee have approved of plans prepared by the City Architect for a girls' secondary school, estimated to cost £25,000 exclusive of roads and fencing, or the terracing, which is estimated at £900. This school will afford accommodation for children in schools which are to be closed.

SAMUEL DEACON & Co., the advertisement agents and contractors, established at Snow Hill over a century ago, and who have occupied No. 154 Leadenhall Street for the last fifty-seven years, have removed to No. 7 Leadenhall Street, nearly opposite. We understand their premises have been acquired by a large insurance company for reconstruction.

THE Hull Corporation Tramways Committee last week accepted the tender of Messrs. Bolling & Lowe at £7,969 9s. 3d. for steel rails, manufactured by the Phoenix Company in Hamburg. The Deputy-Chairman stated, in reply to a question, that five or six British firms had been asked to tender, and only one had done so, the majority of the others saying they were full up.

AN extensive scheme of extensions is projected for Port Talbot, South Wales. The Port Talbot Railway and Dock Co. intend to embark on extensions costing over £100,000. Of this total £80,000 is for the extension of the breakwater at the entrance channel. Another contract for £414,000 is already let. This work consists of dredging as a preparatory task to the construction of a ferro-concrete wharf at the end nearest the Port Talbot Steel Works.

DANGEROUS PROPERTIES IN GLASGOW.

MR. JOHN LINDSAY, Town Clerk of Glasgow, has issued a notice to property owners and house factors in the city in which he says that the Corporation have had under consideration the frequent and serious injuries which have been sustained by members of the public through the falling of chimney cans, rhones, slates, &c., and have instructed him to direct attention to the requirements of Section 82 of the Glasgow Building Regulations Act, 1900, and to the fact that it is the duty of the owner of every building to have it and its external adjuncts regularly inspected by competent persons, and to immediately remedy all defects which may be discovered by such inspection. Mr. Lindsay further directs attention to the fact that, apart from the question of civil liability for any accident that may occur, should any building, projection, chimney head, chimney can, rhone, &c., be in a dangerous condition, the owner is liable in a penalty of £5 unless he can prove that he has, within the previous twelve months, caused the inspection required by the statute. The section referred to is as follows:—

The owner of every building shall cause to be regularly inspected by competent persons such building and all projections, chimney stalks, flues, chimney heads, chimney cans, rhones, slates, snow boards, sign boards, lamps or other things connected with or appertaining to such building, and shall forthwith remedy all defects which may be discovered by such inspection. In the event of it being proved to the satisfaction of the Dean of Guild that any such building, projection, chimney stalk, flue, chimney head, chimney can, rhone, slate, snow board, sign board, lamp or other thing connected with or appertaining to such building is in a dangerous condition, such owner shall be guilty of a guild offence, and shall be liable in a penalty not exceeding five pounds, unless he shall prove that he has within the previous twelve months caused the inspection required by this section.

LIGHTING THE HOME.

THE question of efficient lighting has hitherto received little attention at the hands of those responsible for the interior equipment of our homes. And the householder who is apt to wax disputatious over his quarterly bill for electricity or gas rarely considers other and, one would have thought, more obvious methods of economy.

Unfortunately, the mind of the householder who installs, for instance, electric light, and purchases lamps of unexampled efficiency, is, so far as any knowledge of the effective use of the light is concerned, a complete blank.

His fault is that he thinks only in what engineers call "terms of candle-power," and forgets that his primary concern should be, not so much the candle-power of the lamp, but the useful illumination which he obtains from it. It has not occurred to him that light, like a stream of water, can be controlled and directed; and that a 16-candle-power lamp, used and equipped in a proper manner, might give just as much light where he wanted it as a 50-candle-power lamp wrongly suspended and fitted with a light-absorbing shade.

The chief defects of present methods of house lighting have been briefly summarised thus by an illuminating engineer:—

(1) Pendant lamps are generally hung too low, so that they are in the line of vision. Brilliant light sources suspended in such a position are physiologically harmful. Moreover, they defeat their own object, because the "glare" of the lamps causes the pupil of the eye to contract and permits only a small part of the light to enter.

(2) Wall brackets are frequently used for drawing-room lighting, with the result that a large proportion of the light is absorbed by the coloured wall-paper.

(3) And in both wall-bracket and pendant systems of lighting the lamps are, more often than not, equipped with shades which do not redirect or distribute the light, but only absorb it.

The proper place for the lamp, in a room where a good, general illumination is required, is close up to the ceiling, or, if possible, right on it. As an electric lamp emits most of its light horizontally, it is necessary to employ some form of reflector which will redirect the light on to, and distribute it over, the "working-plane"—i.e. the desk or table level. In this way "glare" and uneven lighting are avoided.

Glass reflectors, with vertical prisms moulded on the exterior surface, afford the most artistic and effectual means of accomplishing this. And if the correct type of reflector be chosen, the light can be redirected from a lamp fixed on

the ceiling in such a manner as actually to give an increase of useful illumination on the "working plane" over that given by an improperly equipped lamp hanging in unhygienic proximity to the eyes.

A still more thorough method of obviating "glare" is to hide the lamps altogether. This may be done by fitting the lamps into a metal or plaster bowl containing powerful up-turned reflectors. The whole fitting is suspended by chains from the ceiling; and all that is visible from the floor is the ornamental exterior of the bowl. The reflectors throw the light on to the ceiling, whence it is reflected downwards over the whole room. Owing to the large area of the reflecting surface (the ceiling) the distribution and diffusion of the light are entirely uniform, and the total effect is extremely restful and comforting.

This method of illumination is known as "Indirect Lighting," and an excellent example is the British Thomson-Houston Company's "Eye-Rest" system. Indirect lighting is efficient, artistic and hygienic, and in the near future will probably be the usual method employed for the general illumination of our homes, although, of course, it will not supersede the small table or desk lamp for strictly local purposes.

However, it is not wise to be dogmatic on any matter which concerns the Englishman's home, for it is a place in the conduct of which he is apt to resent interference or advice, and sometimes even the expression of an opinion contrary to his own. In his office or works he may pursue efficiency with an enthusiasm at once admirable and upsetting, but in his home he reserves to himself the right to be as wasteful and extravagant as he pleases.

In a sense he is right to preserve this distinction, and these criticisms and hints are accordingly put forward with extreme diffidence, in the manner of a convicted trespasser in a strictly private place.

A NEW AND IMPROVED METAL LATHING FOR PLASTER WORK.

THE interesting announcement is made that the Expanded Metal Co., Ltd., of York Mansion, York Street, Westminster, S.W., and Stranton Works, West Hartlepool, has succeeded in producing an improved diamond mesh lathing, which will be obtainable at prices lower than those for the original varieties.

The new lathing is made under a recently patented process, and will be known by the trade name of "BB Expanded Metal" lathing. It is made in standard size sheets 9 feet longway of mesh by 2 feet shortway of mesh, which is an increase of 1 foot in length as compared with the original lathings. It has several important advantages over its predecessors. First and foremost its cost is less, then it may be used at wider spacings, and it requires less plaster.

Several practical tests have been made under ordinary working conditions by well-known plasterers, who have used many thousands of yards of the original lathings, and their reports all agree that not only is the new lathing stronger and stiffer, but that on account of the reduced size of the diamond mesh, together with the improved slope of its strands, less plaster goes through to form the "key," and practically none falls off and is wasted.

"BB Expanded Metal" lathing is now ready for the market, and (as it is sold through the merchant trade only) stocks will be held in most large centres.

It is listed in three gauges, thus: BB 26-gauge expanded metal lathing, BB 24-gauge expanded metal lathing, and BB 22-gauge expanded metal lathing.

Reference to the price list issued by the Expanded Metal Co., Ltd., shows that, gauge for gauge, a saving of from 25 per cent. to 60 per cent. is made by substituting the new lathings for the old. But the saving in cost is really more than the difference between the price list rates for equivalent gauges because of the wider spacings that may now be used. To take one gauge only, in the original lathing, No. 1, 24-gauge, is not recommended for spacings over 12 inches, whereas "B" 24-gauge may be used for spacings up to 15 inches in ordinary horizontal or sloping work, and up to 18 inches in ordinary vertical work.

Tests have been made at these spacings with entirely satisfactory results, both with ordinary lime and hair mortar and with special quick-setting plaster, and these facts should produce a ready and large sale for the new lathing.

THE Secretary of the Incorporated Church Building Society, 7 Dean's Yard, Westminster, has received a bank-note for £1,000 from an anonymous contributor.

BUILDING PROGRESS IN THE PROVINCES
AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

BERKSHIRE.

Ramsbury.—Twelve cottages, for the R.D.C.*Reading*.—Council School, Wokingham Road: manual instruction block (£750).*Windsor*.—King Edward VII. Hospital: women's ward (£3,000); also children's ward.

CORNWALL.

Redruth.—Business premises, Higher Fore Street: extension for Mrs. Gribble.

Four houses, North Country, for Mr. W. Penna.

Two houses, Wheal Harmony, for Mr. J. Luke.

St. Austell.—Workhouse Infirmary: alterations (£2,000).

DERBYSHIRE.

Glossop.—Council Elementary Day Schools (£7,700); also Infant School at Whitfield.*Kilburn*.—Colliery School (£600).*Long Eaton*.—Council School.

DEVON.

Exeter.—Nos. 139 and 140 Sidwell Street: rebuilding. Mr. J. A. Lucas, F.S.I., A.R.I.B.A., architect.*Plymouth*.—Masonic Hall, Tavistock Road.*Torquay*.—Cookery, laundry, and handicraft centre, Homelands.

DURHAM.

Coxhoe.—Hall for the Social and Literary Institute (£1,000).*Lanchester*.—Smallpox hospital.

ESSEX.

Chelmsford.—Five cottages, off Springfield Road, for Mr. N. G. Bradridge.

Six cottages, Marconi Road, for Mr. G. A. Golding.

Fifteen cottages, Marconi Road, for Messrs. Johnson & Hawkes.

Fifty cottages, Rainsford Lane.

Extension of main building and new chip-house, for Hoffmann Manufacturing Co.

Cold Norton.—Council School.*Hornchurch*.—Boys' Council School, off Globe Road.*Ingrave*.—C. of E. School for 150 places.*Ockenden, South*.—Council School: alterations and enlargements (£4,200).

Village school alterations and repairs (£2,500).

Purfleet, Stifford, and West Thurrock.—Cookery and handicraft centres (£1,100).*Romford*.—Children's Isolation Block at the Infirmary for six boys and six girls.*Southend-on-Sea*.—All Saints' Church Hall (£2,000). Sir Charles Nicholson, Bart., F.R.I.B.A., architect.*South Ockenden*.—(See Ockenden.)*Stifford and West Thurrock*.—(See under Purfleet.)

HAMPSHIRE.

Basingstoke.—Six houses, Penrith Road, for Messrs. Bowerman & Fox.

Two houses, Winchester Road, for Messrs. Hedderley & Purdue.

Portsmouth.—Public Elementary School, Wimborne Road, Southsea.*Southbourne*.—All Saints' (Permanent) Church.

KENT.

Ashford.—Boys' Council School: enlargement for eighty additional places.

S.E. and C. Railway Girls' School for 300 places.

Technical Institute, Elwick Road.

Borough Green.—Council School enlargement by 150 places.*Chatham*.—Council School, Ordnance Street.*Eynsford*.—Baptist Sunday Schools.*Gillingham*.—St. Augustine's Church (£5,000).

LANCASHIRE.

Bolton.—St. Luke's Men's Club: addition for Mr. W. H. Higson.

Cotton Store, Adelaide Street, for Messrs. Tootal, Broadhurst, Lee & Co.

King Edward VII. Memorial Nursing Home. Messrs. Henderson & Brown, architects.

Wilkinson Sanatorium: women's five-bed ward.

Additions to Works, Mortfield Lane, for Messrs. T. Cross & Co.

Wigan.—Infirmary: out-patients' department (£10,000).

LEICESTERSHIRE.

Evvington and Stoughton.—King George V. Village Hall (£1,100).*Leicester*.—Royal Infirmary: children's hospital, operating theatre, &c. Messrs. Everard, Son & Pick, F.R.I.B.A., architects.

LINCOLNSHIRE.

Lincoln.—Church of St. Katharine and All Saints', Clumber Street and Newark Road; 300 sittings (£1,300).

MIDDLESEX.

Harefield.—Cottage, Park Lane, for Mr. G. Winship.*Northolt*.—Thirteen houses, Church Rd., for Mr. Birks.*Staines*.—Cottage hospital (£2,000).

NORFOLK.

Caister-on-Sea.—Unionist Hall. Mr. A. S. Hewitt, A.R.I.B.A. (of Great Yarmouth), architect.

NORTHAMPTONSHIRE.

Holcot.—Infectious Diseases Hospital. Mr. A. Lewis, R.D. Council surveyor for Brixworth.

NORTHUMBERLAND.

Newburn.—Fifty-eight houses, Walbottle, for the U.D.C. Mr. T. Gregory, Council surveyor.

NOTTINGHAMSHIRE.

Huthwaite.—Council School.*Walkeringham*.—Council mixed school for 140 places.*Worksop*.—Council School, Stanley Street.

SOMERSET.

Bath.—St. Bartholomew's (New) Church.

STAFFORDSHIRE.

Longton.—Cottage Hospital extensions.*Smethwick*.—Offices, Alma Street, for the Imperial Bedstead Co.

Shop alterations, 56 Cape Hill, for Boots, Ltd.

Stores, Grove Street, for the Centaur Tool Co.

SURREY.

Camberley.—Council Schools: improvements (£1,650).*Guildford*.—Alterations, &c., to Council Schools. Mr. C. G. Mason, A.M.I.C.E., Borough surveyor.*Kingston-on-Thames*.—Almshouses, London Road: two houses. Mr. Hardwick, F.R.I.B.A., architect.*Parr's Bank, Market Place*. Mr. W. E. Hewitt, A.R.I.B.A. (of London), architect.

Two houses, Woodbines Avenue, for Mr. Moulard.

House, Albany Park Road, for Mr. E. Webb.

"Three Tuns" P.H.: rebuilding.

New premises in Church, Clarence, and Wood Streets, for Messrs. North & Robin.

SUSSEX.

Balcombe.—House, Highley Manor Estate, for Mr. Walker.*Hastings*.—Mission Church, St. Leonards.

WARWICKSHIRE.

Coventry.—Two houses, Styvedale Avenue, for Mr. Cox.

House, Broadway, for Mr. G. Blakeman.

Two houses, Broadway, for Mr. A. C. Taylor.

Two houses, Bray's Lane, for Mr. G. W. Huggett.

Two houses, Beaconsfield Rd., for Jervis Brothers.

House, Belvedere Road, for Mr. L. Aldridge.

House, stable, &c., Cross Road, for Mrs. Ely.

Two houses, Huntingdon Road, for Messrs. Seal & Tierney.

Two houses, Irving Road; and two houses, Northfield Road, for Mr. T. Ward.

House, Queen Mary's Road, for Mr. A. Orr.

Two houses, Queen Mary's Road, for Mr. C. Orr.

Eight houses, Ransom Road, for Mr. H. Goode.

Three houses, St. Osburg's Rd., for Jervis Brothers.

Two houses, Stanway Road, for Mr. C. Humphreys.

Two houses, Stepney Road, for Mr. A. Jeffs.

Eight houses, Awson Street, for Mr. A. Harris.

House, May Street, for Mr. J. Whetstone.

House and workshop, Harnall Lane East, for Mr. W. Satchwell.

Offices, Northey Road, for the Sterling Metals, Ltd.

Alterations to premises, Victoria Street, for the Coventry Perseverance Co-operative Society, Ltd.

Printing Works, Cheylesmore: extensions for Messrs. W. W. Curtis, Ltd.

Shop premises, corner of Spon and Windsor Streets: additions for Mr. F. Bird.

Sub-station, off Aldbourne Road, for the Corporation Electricity Department.

Technical Institute.

Weaving shed, Carlton Road, for Mr. W. Laird.

Foleshill.—Public Elementary School, Windmill Lane, for 340 places.

WILTSHIRE.

Aldisbury.—Wesleyan Sunday School.

YORKSHIRE.

Bridlington.—Twenty-five workmen's dwellings, Watson's Balk, Marton Road. Mr. E. R. Mathews, Borough surveyor.

Cawood.—Wesleyan Church (£1,000).

Horsforth.—Infants' school for 200 places (£2,400).

Huddersfield.—Eleven houses and shop, Raw Nook Road, Salendine Nook, Longwood. Mr. S. M. Balmford (of Longwood), architect.

Keighley.—Congregational Mission Church, Queen's Road, Ingrow. Messrs. J. Haggas & Sons, architects.

Institute extensions (£13,000).

Leeds.—Alterations to Scotsman Hotel, Call Lane. Mr. J. Jackson (of Bradford), architect.

Malton.—Opera house.

Selby.—Fifteen cottages, East Common Lane.

WALES.

Bluenagarw.—"Garrog House": re-building. Messrs. Cook & Edwards (of Bridgend), architects.

Cardiff.—National Museum of Wales, Cathays Park. Messrs. Smith & Brewer, F.F.R.I.B.A. (of London), architects.

Crickhowell.—Unionist Club-house. Mr. J. V. Richards, architect.

Glyn Neath.—"Crown Inn": alterations. Mr. J. C. Rees (of Neath), architect.

SCOTLAND.

Edinburgh.—St. Bernard's School, Dean Park Street: alterations.

Glasgow.—Electricity sub-station, Vinicombe Street, Hillhead. Mr. W. W. Lackie, electrical engineer.

Public baths and wash-houses, Douglas and Walker Streets, Partick.

Lesser Hall and Offices, Maxwell Street, Partick, for the Town Council. Mr. J. Bryce, Burgh surveyor.

Five semi-detached villas, Crown Circus, Partick.

Parish church and beadle's house, Squire Street, Whiteinch.

Greenock.—Public baths and wash-houses, Ann Street.

Inverurie (near).—House and steading, Mains of Flack: additions and alterations. Messrs. Walker & Duncan, C.E. (of Aberdeen), architects.

Paisley.—Alterations to 17 High Street and Cumberland Place, for construction of a picture theatre for the Paisley Picture Theatre, Ltd.

Perth.—Infirmary: children's ward.

IRELAND.

Cork.—House, Glasheen Road. Mr. D. M. O'Connor, A.R.I.B.A., M.R.I.A.I., architect.

HOUSE BUILDING EXTRAORDINARY.

In the old days, that are not really so very long ago, when the Boers first migrated into what is now the Transvaal, it was arranged amongst the "trekkers" that any of the party who should desire a certain part of the land could claim it by erecting a dwelling-house on it, and, as soon as the house was completed, the land for a specified distance round it became his property. It often happened that several of the pilgrims fancied the same land, and each, with the aid of his family, set to work to erect a dwelling. In this case the man whose building was completed first received the property, and the losers, in a spirit of revenge, invariably pulled down the buildings they had erected. This pulling down was an easy matter, as the structures were "rushed" up at a speed that would astonish anyone conversant with the ordinary lethargy of the Boer. Very often disputes occurred as to the weather-proof nature of the houses so put up, and the leaders of the "trekkers" were called in to adjudicate in the matter. Many of these old houses are still standing, and the owners of the land on which they stand, who of course have now other and more commodious dwellings, point them out with pride to visitors and describe how their grandfathers "bought" the land by putting up the house. Some of these old houses have been turned into "guest-rooms," much to the disgust of the older people, for according to all tradition the "guest-room" should be the most comfortable and ornamental apartment. As guests, however, are few and far between in the rural districts of the Transvaal, this is not such a serious matter. It is the modern spirit of breaking

away from old associations that causes the remonstrance. Some of these old houses are long, low buildings, the predecessors of the modern Boer homestead, others of different shape. The shape did not matter, the main object being to satisfy the judges. It is said, however, that these worthies possessed all the acquisitiveness that is charged against the Boer, and were not always above accepting a gift, and that "a good beast (ox) and a bad house often went together." But possibly this is a libel.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 16,471. July 18, 1911.—Improvements in or relating to window sashes. James Johnston, the Diamond and Butcher Street, Londonderry, architect and surveyor. This invention relates to window sashes which are provided with toothed racks, one upon the upper and another upon the lower sash, adapted to co-operate with one or more toothed pinions rotatably mounted upon spindles secured to brackets in such a manner that the two sashes counterbalance each other, the movement of one sash effecting the movement of the other. Fig. 1 is a sectional plan of one side of a window

frame. Fig. 2 is a sectional side elevation showing a method of preventing air from entering by one sash when the other sash is open. The toothed racks 1 are attached to the sashes

FIG. 2.

by wood screws. The pin 3 on which the pinion 4 rotates is fitted on a bracket 5 fixed by screws 2a to the window frame 14, and has washers 8, one on each face of the pinion 4, the latter being retained by the head 9. One pinion is arranged on each side of the window, with corresponding pairs of toothed racks. As the upper sash could not be opened without opening the lower one 11 in order to permit of the upper sash being opened, while precluding ingress of air at the bottom, a bead 12 may be fixed on the sill 13 of the window frame, so that the sashes are moved through a distance equal to the depth of the said bead before air can enter at the bottom, as shown in fig. 2, in which the dotted lines 11a represent the lower sash raised so as to open the top sash. 15 is the window pane and 17 and 18 the outside and inside window casing. May 15, 1912.

PATENT SPECIFICATIONS PUBLISHED JUNE 27, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

- 13,334. June 2, 1911.—A. F. Harrison, "Tilecot," Curzon Road, Weybridge, and O. L. Peard, 42 Dingwall Road, Croydon. Heating appliances.
- 13,423. June 3, 1911.—J. T. M. Johnston, 79 Mark Lane, E.C. Portable tar boiling apparatus.
- 13,574. June 6, 1911.—M. A. Bleichert and M. P. Bleichert, Leipzig, Gohlis, Germany. Remote controlling apparatus for electrically actuated winches and the like.
- 7,936. Mar. 30, 1911.—W. R. Cooper, 113 Tulse Hill, S.W. Apparatus for heating water or other liquids.
- 11,475. Nov. 9, 1911.—J. G. Cracknell, 21 Whittall Street, Birmingham. Vacuum cleaners.
- 13,179. June 1, 1911.—J. H. Secker, 33 Mackenzie Street, Slough. Automatic locking joint for water stand-posts, hydrants, and the like.
- 13,255. June 2, 1911.—James Heaton, The Ravenhead Sanitary Pipe and Brick Co., Ltd., St. Helens, Lancaster. Mode of, and apparatus for, manufacturing roofing and like tiles.
- 13,752. June 9, 1911.—E. J. Bull, district engineer, Chupra, Sarun District, Bengal. Rolled steel door and window frames.
- 15,430. July 3, 1911.—C. J. Darnall, chemist, Washington, D.C. Method and apparatus for purifying water and sewage.
- 16,492. July 18, 1911.—W. H. Fenn, Constantine Road, Ipswich. Removable grip joint for wood or metal work.
- 18,324. Aug. 14, 1911.—Frank Rippingille, The Cottage, Four Oaks, Sutton Coldfield, Birmingham. Electrical heating and air circulating appliances.

11,222. May 11, 1912.—Chas. Showell, Stirchley Brass-foundry, Stirchley, Birmingham, and John Scrivens, 160 Maryvale Road, Bournville, Birmingham. Spring controlled doors.

L.C.C. SCHOOL OF BUILDING, BRIXTON.

THE Education Committee of the London County Council have considered as to the desirability of establishing courses of instruction suitable for day students whose age and previous education are above the age and standard of education fixed by the Council for admission to the day technical school for boys at the School of Building, Brixton. Applications are frequently received from sons of builders and others whose future in connection with the building industry is assured, and it is almost invariably found that their education has been of a type more advanced than is usually the case with boys who attend the day technical school, most of whom have received their preliminary general education at elementary schools. The Committee are convinced that a need exists for instruction of a higher kind than is at present available during the day time, and are of opinion that steps should be taken to provide facilities for more advanced students from September, 1912. They do not think it will be necessary to increase the equipment of the school to any great extent, nor do they anticipate that the cost of materials for the practical classes will be large. The chief requirement will be additional staff, but their proposals involve only a small increase in this direction, as a good deal of the work can be undertaken by the present whole-time teachers.

For the first year they think the following additional appointments will be sufficient: (i.) a visiting teacher of quantity surveying for one afternoon a week at 15s. per attendance; (ii.) a visiting teacher of reinforced concrete for one afternoon a week at 15s. per attendance; (iii.) a visiting teacher of land surveying for one afternoon a week at 15s. per attendance; (iv.) a visiting teacher of architectural drawing for one morning a week at 12s. 6d. per attendance; (v.) a visiting teacher of physical exercises for one afternoon a week at 10s. 6d. per attendance.

For the second year they anticipate that it will be necessary to appoint the following additional staff: (i.) a visiting teacher of freehand and perspective drawing for one attendance a week at 10s. 6d. per attendance; (ii.) a visiting teacher of physical exercises for one attendance a week at 10s. 6d. per attendance; and (iii.) visiting teachers of mathematics, reinforced concrete, land surveying, quantity surveying and mechanics, each for two attendances a week at 15s. per attendance. The above-mentioned rates of pay are all in accordance with the scale approved by the Council for visiting teachers in technical institutes and schools of art.

In certain cases it may be desirable that students should be admitted to the course for part time only, and in framing the following scale of fees the Committee have made provision for the fees to be paid by such part-time students: For the complete course, £3 3s. per term; for five two-hour lessons per week, £1 11s. 6d. per term; for any one subject, 10s. 6d. per term.

The following is a tabulated statement of the expenditure involved in the proposal:—

Expenditure—	First and Second Year.		Receipts—	First and Second Year.	
	Year.	Year.		Year.	Year.
Staff and materials ...	186	578	Fees of students and Board of Education grant ...	266 15	533 10

It will be observed that the ultimate net cost of the proposals will be about £45 a year. There will be no additional expenditure either during the first year of the course (September, 1912, to September, 1913) or during the current financial year (i.e., to March 31, 1912). Provision for the expenditure involved in staff and materials during the current financial year has been made in vote No. 194 of the annual maintenance votes, 1912-13. The Committee recommend:—

(a) That, as from September, 1912, advanced day classes of instruction in architectural and building trade subjects be provided at the L.C.C. School of Building, Brixton, suitable for students whose age and previous education are above the age and standard of education at present fixed for the admission of boys to the day technical school conducted thereat; and that such advanced courses be designated the senior day technical school of the L.C.C. School of Building, Brixton.

(b) That students be admitted either to the complete course specified in the foregoing resolution (a), or to part of the course, as may be considered desirable, and be charged fees as follows: For the complete course, £3 3s. a term (three terms a year), or £9 9s. a year; for five two-hour lessons a week, £1 11s. 6d. a term; for any one subject, 10s. 6d. a term.

The report of the Finance Committee under standing orders is to the following effect: The Finance Committee have no observations to offer.

THE JAPANESE AS BUILDERS.

OVER £1,000,000 of private capital has, according to the local Japanese civil administration been invested in buildings in Dalny, Manchuria. Discussing the progress of foreign ideas, the American Consul at Dalny says practically all of the residential buildings erected in recent years were designed and constructed by Japanese architects and contractors, and although the buildings are meant to be of foreign pattern in many cases the impractical interior arrangement leaves much to be desired. Some of the houses have been erected without chimneys, and, considering the zero temperature prevailing during the winter months, surprise must be expressed at this apparent oversight. The lack of chimneys or the impractical nature of those installed has the result of making scores of buildings unsightly in appearance during the cold winter months, as stove pipes have to be stuck out of the windows and elevated to a "safe" sky line.

GLASGOW MUNICIPAL BUILDINGS COMPETITION.

THE Glasgow Corporation's Committee on Municipal Buildings have now approved of the general conditions for the competitive designs to be invited from outside architects for the proposed extension of the buildings. The extension will be erected upon ground on the east side of John Street. Mr. John J. Burnet, LL.D., A.R.S.A., has been appointed by the Corporation to act for them in the competition, which closes on October 29. From the preliminary sketches not more than five designs will be selected, and the authors, who will be invited to submit final designs for competition, will each receive an honorarium of 100 guineas. The Corporation reserve to themselves the right to invite not more than three other well-known architects who may not have submitted designs in the first competition to join in the final competition, and it is the intention to entrust the author of the design placed first by the assessor with the carrying out of the work. The extension may be designed as a detached building to afford all the accommodation for the various departments, but if so designed adequate connection with the existing building must be shown at least on the level of the second floor. The style of the building is left to the competitors, but its harmony with the City Chambers and, if possible, with the existing Sanitary Chambers in Cochrane Street should be carefully considered. It is further required that the extension should be executed in freestone in keeping with that of the existing building. The Corporation are advised that a building suitable for their requirements should be obtained for £150,000, including the expense of alteration of the existing building.

VARIETIES.

THE Gateshead Guardians are about to borrow £6,768 for the purpose of erecting a boiler-house and executing other works at the Union institution at Shotley Bridge.

MESSRS. LOVEGROVE & PAPWORTH, architects, Town Hall Chambers, Old Street, E.C., have prepared plans of a cinematograph hall proposed to be erected at 100 and 102 High Street, Wandsworth.

MESSRS. W. WOODWARD & SONS and Mr. G. W. Booth have submitted plans to the London County Council showing the erection of a cinematograph hall on a site in Regent Street, now partly occupied by the New Gallery Restaurant. It is believed that the expenditure involved will be about £60,000.

THE Theatres and Music Halls Committee of the London County Council, after considering plans submitted by Messrs. Wylson & Long for the reconstruction of the Tivoli Music Hall, Strand, W.C., recommend that a certificate should be granted subject to twenty-seven conditions being complied with. Seating accommodation is shown to be provided for 1,580 persons.

THE Secretary of State for the Home Department has decided that the remuneration for the year 1912 of the members of the Tribunal of Appeal constituted under the London Building Acts shall continue to be on the scale laid down in 1895 and extended in operation until the end of the year 1911—namely, for each member of the tribunal, three guineas for the first hour and two guineas for each subsequent hour of each day's sitting.

THE Glasgow School Board have approved of sketch plans showing a permanent school building at Garrioch for the accommodation of 200 physically and 80 mentally defective children, and providing, besides ordinary class-rooms, rooms for cooking, laundry work, manual instruction, tailoring, and shoemaking, a resting shed, and a janitor's house. The school is to be built of brick, and will be the first in Scotland planned on the open-air principle. The estimated cost is £9,600.

MESSRS. "DAY AND NIGHT SCREENS," LTD., of 38A Berners Street, Oxford Street, W., are showing at the White City, Shepherd's Bush, the latest development of cinematography. The "day and night" screen has a specially silvery-coated surface upon a moisture proof canvas backing. The pictures projected on it are clear, whether they be shown in broad daylight or in the dark. Commercially, the open-air cinema promises to be successful, as there is said to be an economy of current in working of from 50 to 80 per cent.

THE *Nachrichten für Handel* (Berlin) of June 13 states that arrangements have been made for the erection of five new large hotels in Bucharest, Roumania. In addition, the following buildings are being constructed:—Carol I. University, Military Club, "Credit Roman" Bank, Town Hall, Senate House, and the "Agricola" Insurance Company's premises. Roumanian cement manufacturers had arranged to produce only 12,000 waggon loads of cement this year, but they have orders on hand for more than 24,000 waggon loads.

THE Improvements Committee of the London County Council report as follows:—"The contract for the sale to the Commonwealth of Australia of the eastern horn of the crescent site between the Strand, Aldwych, and Melbourne Place provided for the elevations of the buildings proposed to be erected on the site to be submitted to, and approved by, the Council. Drawings have now been submitted of the elevations of the proposed buildings. The elevations, which it is proposed shall be constructed in Portland stone, follow the scheme outlined by Mr. Norman Shaw, R.A., when the Victoria Government building was erected, and it is intended to effect a slight alteration in the latter building in order that it shall accord with the general scheme. The design is very bold and on a large scale, and we have no hesitation in recommending the Council to approve the scheme."

SIR FRANK WILLS, F.R.I.B.A., is to be congratulated on receiving the honour of knighthood at the hands of his Majesty in connection with King George's visit to Bristol last week. Sir Frank Wills, who is Lord Mayor, is a son of the late Mr. H. O. Wills, one of the founders of the tobacco business carried on by W. D. & H. O. Wills. He is also a half-brother of the late Mr. H. O. Wills, of Kelston, who subscribed £100,000 to the fund for establishing Bristol University, and a cousin of the late Lord Winterstoke. Mr. Frank William Wills (now Sir Frank Wills) was born at Bristol in 1852, and educated at Amershall Hall, Reading. By profession he is an architect and surveyor, and many buildings in Bristol and neighbourhood, as well as in other parts of the country, including the Bedminster tobacco factory of W. D. & H. O. Wills, the Art Gallery, the St. George Library were erected from his designs. He is a Liberal in politics. The Lord Mayor did not enter the Council until 1908.

A MEETING of the General Committee of the George Petrie Memorial was held on Saturday last at the rooms of the Royal Society of Antiquaries, Stephen's Green, Dublin. G.N. Count Plunkett, K.C.H.S., was in the chair. It was decided to arrange for a popular lecture, illustrated by lantern views, descriptive of the life and works of Dr. Petrie, and detailing his great services to Irish archaeology, in particular in laying the foundations of our present knowledge of early Irish architecture to be held in the coming autumn. The Right Hon. M. F. Cox, M.A., consented to deliver the lecture, and Lord Ardilaun was invited to take the chair on the occasion. It was decided to widen the scope of the project so as to include the erection of a bust and suitable inscription, or other worthy monument in some public place, in addition to the erection of a monument over the grave. The Executive Committee includes Count Plunkett, Hon. A.R.I.B.A., Mr. R. M. Butler, F.R.I.B.A. (Hon. Secretary), Mr. Robert Cochrane, F.R.I.B.A., and Mr. P. J. Lynch, M.R.I.A.I.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

GLASGOW.—The Corporation of the City of Glasgow invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—July 22.—Architects are invited to send in plans for two semi-detached houses to be erected at the District Lunatic Asylum, Cork, the cost not to exceed £600 each. Each house to consist of drawing-room, dining-room, two principal bedrooms, servant's room, bath-room (supplied with hot and cold water apparatus), kitchen, pantry, and scullery, with hot and cold water, &c. A prize of £10 will be given for the plans deemed most suitable by the Committee of Management. Plans to be lodged by noon on July 22 with the Resident Medical Superintendent, District Lunatic Asylum, Cork.

CONTRACTS OPEN.

ALDERSHOT.—July 17.—For construction of reinforced concrete coal bunkers, engine shed, &c. Aldershot Gas, Water and District Lighting Co., Victoria Road, Aldershot.

ARMLEY.—July 16.—For erection of two dwellings in Esmond Terrace, for the Leeds Improvements Committee. Mr. W. T. Lancashire, city engineer, Municipal Buildings, Leeds.

ARMLEY.—July 30.—For the whole or any portion of the works required to be executed in the erection of United Methodist Church school, &c., at Colton Road. Send applications at once to Mr. J. Auty, A.R.I.B.A., architect, Peel Street, Morley.

LONDON.—July 17.—For repairs to economiser house and sinking of two additional piers for foundations, for the Fulham Borough Council. Mr. A. J. Fuller, Electricity Department, 603 Fulham Road, Fulham, S.W.

LONDON.—July 18.—For alterations and improvements to buildings, South Norwood Council School; (b) extension of building, mechanical engineering workshop, central polytechnic; and (c) internal and external painting at Education Office, for the Croydon Education Committee. Mr. J. Smyth, clerk, Education Office, Katharine Street, Croydon.

LONDON.—July 18.—For providing and laying "Armaded" flooring, plastering walls, and decorative works to wards 2 and 3, and female receiving ward of the infirmary, Marloes Road, W., for the Kensington Board of Guardians. Mr. W. R. Stephens, clerk, Guardians' Offices, Marloes Road, Kensington, W.

LONDON.—July 24.—The Metropolitan Asylums Board invite tenders for providing and fitting up of bed-pan and other sinks at the North-Western Fever Hospital, Lawn Road, Hampstead. Deposit £1. Mr. W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief, the office of the Board, Embankment, E.C.

LONDON.—July 25.—For the erection of steel framing and zinc flats to second-floor sunning balconies at the St. James's Infirmary, Ouseley Road, Balham, S.W., for the Guardians of Wandsworth Union. Mr. F. W. Piper, clerk, Union Offices, St. John's Hill, Wandsworth, S.W.

NETHERTON.—July 16.—For the erection of a boundary wall and the asphaltting of the playgrounds at Netherton Council School, for the Horbury District Education Committee. Mr. Benj. Sheard, divisional clerk, W.R. Educational Offices, Northgate, Wakefield.

NORTH DALTON.—July 29.—For the erection and completion of two workmen's houses, for the Sunderland and South Shields Water Company at their North Dalton pumping station, near Murton. Deposit £2 2s. Mr. Alfred B. E. Blackburn, A.M.Inst.C.E., 29 John Street, Sunderland.

RAINHILL.—July 25.—For the erection of two cottages at the County Asylum. The Engineer's Office, Rainhill Asylum, Lancashire.

ROOSE.—July 24.—For an extension of the workhouse at Roose, for the Barrow-in-Furness Guardians. Mr. H. T. Fowler, A.R.I.B.A., Cornwallis Street, Barrow-in-Furness.

SALISBURY.—July 30.—For new oak sashes at the Council chamber. Mr. W. J. Goodwin, A.M.I.C.E., city engineer and surveyor, Municipal Offices, Salisbury.

SCOTLAND.—For the mason, joiner, plumber, plaster, slater, glazier, and painter works of new school at Muirhead of Liff, for the Liff, Benvie, and Invergowie School Board. Messrs. Thoms & Wilkie, F.R.I.B.A., 46 Reform Street, Dundee.

SCOTLAND.—July 18.—The Commissioners of H.M. Works and Public Buildings are prepared to receive tenders for the erection of a new Post Office at Wick. Tenders are required for the whole work, and not for separate trades. Deposit £1 1s. The Postmaster at Wick Post Office, and H.M. Office of Works, 3 Parliament Square, Edinburgh.

SCOTLAND.—July 29.—For mason and structural steel-work of new training college, Dundee, for the St. Andrew's Provincial Committee for the Training of Teachers. Deposit £1 1s. Mr. T. M. Cappon, F.R.I.B.A., architect, 32 Bank Street, Dundee.

SEDFIELD.—July 17.—For the restoration of and additions to the Parish Church (whole tenders only). Mr. W. H. Wood, F.R.I.B.A. (successor to the late C. Hodgson Fowler), architect, 20 Collingwood Street, Newcastle-on-Tyne, and 47 North Bailey, Durham.

SHEFFIELD.—July 26.—For the building extensions required in connection with the electric power station, Club Mill Lane, Neepsend. Deposit £5 5s. Mr. S. E. Fedden, general manager and engineer, Commercial Street, Sheffield.

SHERBURN HILL.—July 16.—For alterations and additions at the boys' and infants' schools. Mr. N. Richley, Shire Hall, Durham.

STAINLAND.—July 16.—For alterations and repairs (plumber, plasterer, and asphalter) at the West Vale Council school; also Bowling Green and Sowood Council schools, Stainland, alterations and repairs (builder, joiner, and asphalter), for the Greetland and Stainland Education Subcommittee. Mr. F. Parker, Education Offices, Elland.

STAINLAND.—July 19.—The West Riding Education Committee invite whole or separate tenders for the following works:—Stainland Bowling Green Council School, drainage (excavator, mason, and bricklayer, and plumber and sanitary engineer). The Education Architect, County Hall, Wakefield.

STEBBING.—July 19.—For alterations, additions, radiator heating apparatus, painting, &c., to be done during the summer holidays at the Stebbing Council School, for the Essex Education Committee. The Head Teacher.

SURBITON.—July 26.—The Urban District Council invite tenders from contractors of experience for the construction of the power station, destructor house, and other incidental works at the Sewage Disposal Works, Lower Marsh Lane, Surbiton. Send applications and £5 5s. deposit by July 18 to Mr. H. T. Mather, engineer, Council Offices, Ewell Road, Surbiton.

THATTO HEATH.—July 31.—For the erection and completion of a public library, together with all contingent works, situate at the south-west corner of Thatto Heath Park, near St. Helens. Mr. A. W. Bradley, M.I.C.E., borough engineer, Town Hall, St. Helens.

UPPER GREETLAND.—July 15.—For the mason's, joiner's, plumber's, plasterer's, slater's and painter's work required in the erection of parish church offices. Mr. F. Gordon, surveyor, Clifton, Brighouse.

WALES.—For alterations and additions to the Rose and Crown public-house, Goodwick, Haverfordwest. Deposit £1 1s. Mr. Hugh J. P. Thomas, architect, 9 Victoria Place, Haverfordwest.

WALES.—July 18.—For additions and alterations to Moriah Chapel, Llanelly, for the Trustees. Mr. J. Evans, C.E., 47 Stepney Street, Llanelly.

WALES.—July 18.—For the proposed new stable accommodation and engine house to be erected at rear of Blaenlae Street, Penygraig. The Committee of the Penygraig Industrial Society, Ltd., Penygraig.

WALES.—July 18.—For the erection of an Infirmary at Bangor, North Wales, for the Guardians of the Bangor and Beaumaris Union. (Mr. Frank Bellis, architect, Bangor.) Send applications and £5 5s. deposit (excepting such contractors who have already made this deposit) to Mr. R. Benjamin Evans, clerk to the Guardians, Union Offices, Bangor.

WALES.—July 19.—For certain works to thirty-eight semi-detached villas and for the completion of nine partly-erected houses in one terrace; also separate tender for making-up accommodation roads at Badminton Grove, Ebbw Vale, for the Blaen Ebbw Building Club. Messrs. Wm. Harris & Son, architects and surveyors, Bank Chambers, Bargoed, or Mr. W. Williams, accountant, Station Chambers, Ebbw Vale.

WALES.—July 19.—For competitive designs and tenders for the erection of a ferro-concrete boat shelter at the Roath Park, Cardiff, consisting of a flat promenade roof about 150 feet long by 21 feet wide, supported on columns and arched beams, for the Corporation. Mr. W. Harpur, M.I.C.E., city engineer, City Hall, Cardiff.

WALES.—July 19.—For alterations and additions to the administrative block at the union workhouse, Merthyr Tydfil. Mr. T. Roderick, architect, Clifton Street, Aberdare.

WALES.—July 20.—For the erection of two semi-detached villas at Carnarvon. Mr. E. F. White, M.S.A., architect and surveyor, Carnarvon.

WALES.—July 24.—For certain reparative works to their institution at Quakers' Yard, Merthyr Tydfil, for the committee of the South Wales and Monmouthshire Truant School. The Truant School, or Mr. William Dowdeswell, M.S.A., architect, Treharris.

WALES.—July 26.—For the reconstruction of mountain retaining wall at Coedcae Road, Trehafod, Glam., 20 feet below road level and 13 feet above, for the Urban District Council. Deposit £1 1s. The Council Offices, Pentre.

WALES.—Aug. 7.—For rebuilding business premises in Rheola Street, Penrhiwceiber, for Messrs. the Penrhiwceiber Co-operative Society, Ltd. Deposit £2 2s. Mr. Philip J. Jones, architect, Church Street, Pontypridd.

WEARHEAD.—July 15.—For erection of a church at Heathery Cleugh, Wearhead (whole tenders). Send applications for quantities by July 15 to Messrs. Clark & Moscrop, F.F.R.I.B.A., architects, Darlington.

WEDNESBURY.—July 31.—For alterations and additions to the public baths and municipal offices respectively, for the Corporation. Separate tenders. Send applications and £3 3s. deposit by July 13 to Messrs. Scott & Clark, M.S.A., architects, Lower High Street, Wednesbury.

WHITLEY.—July 16.—For erection of a shoeing and repair shop at the sewage pumping station, Whitley, near Coventry, for the Coventry Corporation. Deposit £1 1s. Mr. J. E. Swindlehurst, city engineer and surveyor, Saint Mary's Hall, Coventry.

WORSTHORNE.—July 27.—For the concrete work, &c., in the repair of the sewage tanks at Brownside, for the Burnley Rural District Council. Deposit £3 3s. Mr. H. Pritchard, M.I.M. and C.E., engineer to the Council, Union Offices, Burnley.

YEADON.—For the erection of a new chimney at Banksfield Dyeworks. Messrs. Scott & Rhodes, Banksfield Dyeworks, Yeadon, Yorkshire.

MR. GEORGE REAVELL, jun., A.R.I.B.A., Alnwick, has prepared a design for a granite fountain proposed to be erected opposite to the Dunstanborough Castle Hotel, Embleton, as a Coronation memorial. The plans were passed on Monday last by the Alnwick Rural Council.

THE City Engineer of Newcastle-on-Tyne, Mr. W. J. Steele, in his annual report, states that the number of dwellings erected during the year (each flat counted as a separate dwelling) has been 251, or 59 less than in the previous year, and the lowest number recorded since 1882. It is about 220 short of the number required to meet the estimated increase in the population. The estimated number of empty dwellings in the city is 500, and at the present rate of building this number should be rapidly reduced. The estimated cost of new buildings for which plans have been approved by the committee during the year is £341,351, compared with £391,271 for the year 1911, and £476,200 for the year 1910.

TENDERS.

BRUNTCLIFFE.

For the erection of club premises, for the Trustees of the Working-men's Club. Mr. T. A. BUTTERY, L.R.I.B.A., architect, Morley.

PORT OF LONDON OFFICES COMPETITION.

The successful architect in the competition for the head offices about to be erected in Trinity Square, E.C., for the Port of London Authority, is Mr. Edwin Cooper, F.R.I.B.A., of 12 Gray's Inn Square, E.C.

It will be remembered that in response to the competition announced in November last inviting the submission of preliminary sketch designs 170 designs were received. The Authority, on the advice of their assessor, Sir Aston Webb, C.B., R.A., selected the six designs sent in by the following architects:—Mr. Robert Atkinson, A.R.I.B.A.; Messrs. J. A. Bowden & T. Wallis; Mr. Edwin Cooper, F.R.I.B.A.; Messrs. Lanchester & Rickards, F.R.I.B.A.; Mr. J. Reginald Truelove; Mr. Ernest W. Wray. The authors of these designs were invited to take part in the final competition at an honorarium of 200 guineas each. The award of Sir Aston Webb, C.B., R.A., is given above.

The six designs submitted in this final competition will be publicly exhibited at the River Offices of the Authority, Victoria Embankment, E.C., from July 15 to July 30, inclusive, between the hours of 10 A.M. and 4 P.M. (1 P.M. on Saturdays), with the exception of Wednesday, the 17th inst., when the designs will be on view from 2 to 4 P.M.

THE Hull City Council have adopted a scheme for building a secondary school for girls on the Cottingham Road at an estimated cost of £25,000 for buildings alone, exclusive of £900 for terraces and the cost of roads and fencing.

PLANS are now ready for the erection of a public infirmary in Nagyvárad, Austria-Hungary, the cost of which is estimated at £112,500. The hospital will have accommodation for 460 beds.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

Dublin.—South Dublin Union hospitals: extension for a nursing department; also additions and alterations.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 18,482. August 16, 1911.—Improved roofing tile or slab, E. A. Flower, Oxford Street, Manchester, architect. This invention relates to roofing tiles or slabs such as are made from compositions of asbestos or cement. It is designed to provide a roofing tile or slab from such materials which

will be artistic in appearance, material and labour saving, cheap in construction, and a more permanent and effective protection against weather in use. Fig. 1 is a transverse section of roof showing the slabs or tiles laid in position

thereon. Fig. 2 is a part plan of roof. The slabs or tiles A are preferably made from cement and a reinforcing member of wire mesh. Each slab or tile is made of such a size or length as to span the required distance between the centre of three or four spars of the roof of a building; that is, each slab is preferably to rest on three or four spars. The slabs are of any ordinary convenient width, and will be made of various thicknesses as may be required to imitate slates, ordinary clay tiles, or "stone slates." The slabs may be divided at intervals with cuts, notches, indents, ridges, or other marks, *a1*, to represent tiles or slates—or may be left plain, and the edges may be shaped to represent any ornamental shape to give any desired artistic appearance. Each slab is formed at its top edge with a longitudinal retaining rib or lip *b*, and an abutment rib *c* deeper than the lip *b* on the upper side, and with a projection or rib *d* on the under side, the latter abutting against the rib *c* of adjacent slab, thereby holding and aligning the tiles or slabs in position. When laying the slabs the first row is laid in position directly on the spars, battens transversely from spar to spar being dispensed with, and the succeeding row is laid thereon, the ribs *c* of the first row, against which the central under side ribs *d* of the succeeding row abut, serving in lieu of battens to retain the next row in position and alignment, and so on to the top of the roof. June 5, 1912.

PATENT SPECIFICATIONS PUBLISHED
JULY 4, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 13,693. June 8, 1911.—T. W. Twyford, of Cliffe Vale Potteries, Hanley. Flushing valves.

13,751. June 9, 1911.—E. J. Bull, district engineer, Chupra, Sarun district, Bengal. Hinges for door or window frames.

13,892. June 10, 1911.—Date claimed under International Convention June 11, 1910. La Soc. Courtard, G. Garnier Gil et Cie., 26 rue Boursault, Paris. Means for operating cocks, valves, and the like from a distance.

13,914. June 12, 1911.—William Cockburn, 10 Rosslyn Terrace, off Chester Road, Sunderland. A loose double moulding spindle head for wood working machines.

14,031. June 13, 1911.—Date claimed under International Convention Sept. 6, 1910. J. J. Smith, 988 Ogden Avenue, Bronx, New York. Stone cutting saws.

14,115. June 14, 1911.—F. W. Jennings, 12 Great James Street, Bedford Row, W.C. Control valves.

14,155. June 14, 1911.—W. H. Jarvis, 14 Nelson Road, Belvedere. Sash fasteners.

15,113. June 28, 1911.—William Chattaway, Mill Street, Great Bridge, Staffs. Means for manufacturing metal sections, such as floor plates, roof plates, and the like.

18,110. Aug. 10, 1911.—Thomas Bamforth and W. J. Rodgeron, Carron Co., Carron, Stirling. Hoisting machinery and the like.

18,160. Aug. 10, 1911.—B. J. Grigsby, 1a Rosebery Avenue, E.C. Reflector fittings for electric lamps.

- 7,803. April 1, 1912.—Robert Green, Roecliffe, near Boroughbridge, York. Roofing-tiles.
- 8,849. April 15, 1912.—Date claimed under International Convention May 20, 1911. Aktien Brown, Boverie & Cie., Baden, Switzerland. Brakes in connection with hoisting gear.
- 11,375. May 11, 1911.—J. H. Hopkins, 38 Cooke Street, Old Trafford, Manchester, and A. M. Stansfield, 31 Broom Lane, Levenshulme, Manchester. Carburetted apparatus.

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE "profession" were favoured with fine weather for their visit to Cheshire on Thursday of last week. The party of twenty-four members and friends included the President, Mr. E. R. Sutton, the Vice-President, Mr. H. Gill, Messrs. W. V. Betts, R. Evans, F. W. Gregory, W. R. Gleave, E. H. and A. E. Heazell, Arthur Marshall, W. Pare, A. W. Shelton, and the Hon. Secretary, F. M. Royle.

Moreton Old Hall was the first place visited. This is one of the few remaining half-timbered manor houses of the Tudor period. The oldest portion dates back to 1207, but the greater portion of the building was erected some 300 years later. Situated in the midst of verdant meadows, with its projecting upper storeys and quaint windows, gabled roofs and ivy-clad chimneys and the stone bridge spanning the moat, it is the delight of artists and photographers from all over the world. The interior, with carved oak beams, panelled ceilings, walls, and massive carved fireplaces, is no less interesting, and the old furniture in the rooms is most carefully preserved. Services are still held four times a year in the tiny private chapel.

This old mansion is greatly prized and cared for by the present caretaker, Mrs. Dale, one of whose ancestors has recorded in quaint lettering over one of the windows:—

Rycharde x Dale x carpenter x made x thies x by x the x grac x of x God.

Miss Moreton, the last of the Moreton family, died recently at the age of ninety-two, and the property now passes to Bishop Abraham, of Derby.

Astbury Church was then inspected. The earliest portion of this dates back to the thirteenth century. Among many interesting features is a priest's chamber over the south porch, with a small stone window looking from it into the church. The altar rail, font cover, rood screen, and pew doors are fine examples of Jacobean carved oak work. Astbury was originally the parish church of Congleton. A pew is still reserved for the Mayor and Corporation of this latter town, and they keep up their connection with the church by paying it an annual State visit.

Lunch was taken at the quaint old Lion and Swan Hotel at Congleton, which dates back to the sixteenth century, and is filled with a unique collection of antique furniture, pottery, pewter, and brass work collected by the present proprietor.

The church at Marton was the next call. This is a pretty half-timbered church and tower dating back to the fourteenth century. Through the courtesy of the vicar, the earliest register on vellum, dating from 1558, was seen.

Siddington Church was also visited. This is a similar example of black and white construction, of which the chancel, porch, and roof of the nave are the original fifteenth-century work.

The last church inspected was Gawsorth, a stone building dating back to 1400 or earlier, and containing many beautiful alabaster monuments of the Fytton family. A long pond stretching in front, covered with water lilies, and a quaint old half-timbered rectory facing the church, make the situation an ideal one.

Although the distance covered was nearly fifty miles, the motor-cars brought the party back to Stoke in time to take dinner previous to returning home.

HAMPSHIRE AND ISLE OF WIGHT ASSOCIATION OF ARCHITECTS.

A GENERAL meeting of the above Society was held at 45 Jewry Street, Winchester, last week. Sir William Portal, Bart., F.S.A., President, was in the chair. Representatives from Portsmouth, Southampton, and Bournemouth were present. After a list of candidates had been brought forward and voted upon (four new members being admitted), the draft rules, temporarily adopted on the formation of the Association last March, were re-considered in detail, and finally adopted with a few alterations.

A Council of Management was formed consisting of the President, the Vice-President (Mr. N. C. H. Nisbett), the Hon. Secretary and Treasurer (Mr. R. M. Lucas), the Assistant Hon. Secretary (Mr. Ingalt Sanders), and four Fellows of the Association—namely, Mr. R. F. Chisholm (Portsmouth), Mr. H. L. G. Hill (Winchester), Mr. G. A. Bligh Livesay (Bournemouth), and Mr. Percy G. Stone (Isle of Wight). The Council will arrange a series of meetings to take place at various towns during the winter months. Gentlemen living in Hampshire and the Isle of Wight who are interested in architecture are invited to join the Association, and to communicate with the Hon. Secretaries, Bargate Chambers, Southampton.

GERMAN TOWN PLANNING TOUR IN ENGLAND.

THE Garden Cities and Town Planning Association, of 3 Gray's Inn Place, W.C., are arranging for another visit of members of German municipalities to inspect English garden city and housing schemes, under the guidance of Mr. Culpin, the Secretary.

The party, about 100 strong, will arrive in England on August 18, and the next fortnight will be spent in visits to practically every housing scheme of importance in the country.

Among other places which will be seen are the garden villages of Hull, Earswick, Port Sunlight, Bournville and Knebworth, the garden suburbs of Wavertree (Liverpool), Harborne (Birmingham), Hampstead, Ealing, Ilford, &c., while special interest will be taken in the garden city at Letchworth, where more nearly than any other place in this country the question has been solved of the provision of labourers' dwellings at an economic rate.

Municipal housing will be studied in the various towns visited, and the estates of the London County Council will be visited.

Among the party are some of the prominent town planners and architects of Germany and Austria, while the town of Riga sends a number of officers to investigate.

The visit affords an excellent opportunity for town planners in England to rub shoulders with those who have actually done such work in Germany, and any students and others who would like to join the party at any point, or to meet at their social gatherings, are invited to communicate with Mr. Culpin at the above address.

SHOT FIRING IN MINES AND QUARRIES.

SHOT firing in mines and quarries and in excavation work on a large scale is one of the worst enemies to employers. Despite very stringent regulations there were last year no less than thirty-eight deaths and five hundred and three more or less serious accidents through misfiring. Needless to say, there have been many efforts made to render such mishaps impossible, or at least to minimise the risks. The latest of these were made the object of a demonstration at the Westminster Palace Hotel, London, S.W., on the 4th inst., at which Sir Alfred Mond, Bart., M.P., took the chair.

The "P.P. Safety Shot Firing Appliances" are the patent device of two South Wales colliery employes. It is boldly claimed that the appliances render it impossible that any accident should come about through misfiring, and, moreover, minimises the liability to misfire, with its consequent delay. Any slightly increased cost would obviously be quickly recouped if the operation could be always carried out with perfect safety. The apparatus consists of a detonator shield made of copper, enclosing the detonator and giving protection against friction or rough handling. The detonator wires are attached to the base of the shield in a convenient manner, and in such a way that any tension is taken up by the shield. The wires cannot be separated from the detonator by the use of the shield, and by adopting a special method of stemming the shot hole it is possible to withdraw an unexploded detonator and reinsert a fresh one with perfect safety.

The inserting appliances consist of an external graduated copper tube and an internal copper rod with loose spike. The mode of operation is as follows:—

The base of the primer is opened up with the copper spike to a convenient depth for accommodating the detonator and shield. The detonator and shield are then passed through the tube by means of a copper rod, and inserted into the primer. They are then placed in position in the shot hole, and the hole is stemmed, a semi-circular rammer being used. The balls of stemming used are made on a former. The abrasion of the detonator wires, which is the most prolific cause of the misfires, cannot occur. When the stemming has reached four inches or six inches from the mouth of the hole the copper tube is withdrawn, and the mouth of the hole completely stemmed.

The shot is then fired in the usual way. Should a misfire occur the detonator and shield can immediately be withdrawn by hauling on the electric cables. By the withdrawal of the detonator all danger is removed, and the hole can be approached.

It is claimed for the invention that by its agency the dangerous and costly process of drilling another hole alongside in case of misfire is entirely done away with. No time is lost in searching for unexploded detonators, with its attendant dangers; and, further, by the adoption of the system, it is impossible for any person other than the appointed shot-firer for the district in the mine to charge or stem a shot hole.

TRADE NOTES.

WILLIAM POTTS & SONS, LTD., of Leeds, have received instructions to make and fix a clock in the Hartshead-cum-Clifton Church, Yorks. The clock will have all the recent improvements, including Lord Grimthorpe's double three-legged gravity escapement and compensation pendulum.

MESSRS. CARTER & CO., LTD., the well-known tile manufacturers, of Poole, recently called a meeting of their employees regarding the Insurance Act, when Mr. Charles Carter, who presided, informed the employees that it was the intention of the directors to pay the employees' contribution as well as the employers'. The announcement was received with much gratification.

PALMER'S Travelling Cradle and Scaffold Company inform us that on and after Monday, June 24, the business carried on at 250 Westminster Bridge Road, S.E., will be transferred to their new extensive premises, Victoria Works, 112 Belvedere Road, London, S.E., to which address all communications should be sent. The Company's telegraphic address and telephone number will remain as before—viz. telegraphic address, Wireway, London; telephone number, Hop 1156.

THE imitation stone "Ferrocon" front and fibrous plaster and decorative work for the new Grand Theatre, Pentre, Rhondda Valley (Messrs. Willis & Cromie, architects), has been placed with Messrs. John Tanner & Son, fibrous plaster specialists, of 45 Horseferry Road, S.W., and 3 and 5 Gill Street, Liverpool; also the whole of the fibrous plaster and decorative work for the new Hippodrome, Aldershot (Mr. Bertie Crewe, architect).

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Failsworth, Manchester, have in hand the following contracts:—The extensions to the Royal Infirmary, Bristol, and the new infirmary, Luton, are being supplied with Shorland's double-fronted patent Manchester stoves in faience and with descending smoke flues; the Council schools, Bont, and the Council schools, Athey Street, Macclesfield, are being supplied with Shorland's warm air ventilating patent Manchester grates; the Clydach-on-Tawe Mission Church is being ventilated by means of Shorland's patent concealed extract ventilators and hygienic inlet ventilating panels, and the new isolation hospital, Earlestown, is being supplied with Shorland's double-fronted patent Manchester stoves and patent Manchester grates.

A POWERFUL motor fire engine has just been added to the equipment of the Norwich Fire Brigade. It is of the Merryweather petrol "Hatfield" design, with reciprocating pump capable of delivering 500 gallons per minute and upwards. It also carries a detachable fire escape to reach 50 ft., as well as 2,000 ft. of hose, and affords accommodation for a dozen firemen. The "Hatfield" type was chosen by the City Engineer after he had fully investigated the merits of several other kinds of motor pumps. It is to be hoped that the time is not very far distant when all cathedral cities will be equipped with motor fire engines which can turn out instantly and travel at a speed of over 30 miles an hour.

MR. F. J. BARNES, the Portland Stone Quarries, steam saw mills, masonry and turning works, Portland, Dorset, informs us that he supplied the whole of the Portland stone used on the large new premises at the corner of Oxford Circus, W. (Mr. Henry Tanner, jun., architect). This building was illustrated by us last week. The whole of the stone was worked at Portland and fixed and cleaned by Mr. Barnes' men. A record was created, it is stated, by the speed with which the contract was carried out. Mr. F. J. Barnes informs us that he has supplied or been ordered to supply the whole of the Portland stone used in the following London buildings:—Board of Agriculture and Fisheries (new offices), 40-43 Fleet Street, Imperial College of Science, Woolwich Footway Tunnel; Carlton Theatre (Cinema), Tottenham Court Road; L. C. & W. Bank, High Road, Balham; 3 & 4 Vere Street; 103-109 Wardour Street; 146 & 147 Houndsditch; 191 Wardour Street. Among his recent jobs in the country are the following:—Halstead Bridge; Devonport P.O.; Harbour Commissioners' Offices, Blyth; Lloyds Bank, Manchester; Savings Bank, Stockport; Lancing College; Brockwood Park, West Meon; Adelphi Hotel, Liverpool; King's College Chapel, Cambridge; Crawley Rectory.

VARIETIES.

AN interesting event took place on Tuesday evening last, when Mr. R. A. Briggs entertained at dinner Mr. Herbert Batsford, Mr. Harry Batsford, Mr. Harry Browning (Mr. Briggs's partner), and several of the oldest members of Mr. Batsford's staff to celebrate the twenty-first anniversary of the publication of his "Bungalows and Country Residences."

AN exhibition of work done by students in the Architectural Department of the University of London during the past session will be held in the Science Library, University College, Gower Street, between 9 A.M. and 6 P.M. from July 13 to July 20, both days inclusive.

PROFESSOR C. A. M. SMITH, of East London College (London University) and late of Birmingham, has been appointed Professor of Engineering at the new University of Hong Kong. Professor Smith, it may be remembered, recently contributed to our columns a series of illustrated articles on "Petrol Air Gas," and which have now been brought together in booklet form.

THE twelfth century parish church at Sherburn was dedicated on the 8th inst. after restoration work involving an outlay of £30,000 on the part of Sir Henry Tatton Sykes. Messrs. J. Thompson & Sons, Peterborough, were the contractors, the late Mr. Hodgson Fowler and Mr. W. Brierley, of York, being the architects, whilst Mr. Milburn, of York, executed the fine sculpture work which adorns the exterior.

THE Wallasey Town Council last week considered a recommendation that the plans of Messrs. Briggs & Thornely, architects, be approved with respect to the proposed Town Hall at North Meade. The scheme is estimated to cost £96,500. In the course of the discussion it was pointed out that there was a previous resolution of the Council standing in which the cost had been placed at £80,000. The motion was accordingly out of order, and will be again considered at the August meeting.

THE Building Acts Committee of the London County Council recommend that the Council, in the exercise of its powers under section 41 of the London Building Act, 1894, consent to the re-erection of buildings abutting upon Norfolk Street, Green Street, Park Street, and Wood's Mews, Mayfair, as shown on the plans submitted with the application of Mr. E. Wimperis, on behalf of the Grosvenor Estate. Consent is subject to the condition that the whole of the buildings be completed, and the "common garden" shown on the plan formed within four years from July 9, 1912.

THE London County Council recently invited from firms of surveyors on their list tenders for the work of taking out the quantities, measuring extras and omissions, and supplying valuations for certificates for the proposed eleventh asylum. Eight offers were received, and representatives of the firms who submitted the four lowest tenders, viz., Mr. Herbert Robinson, Messrs. W. H. & P. B. Strudwick, Messrs. Northcroft, Neighbour & Nicholson, and Messrs. C. J. Mann & Son, have been interviewed. After full consideration the Asylums Committee decided to accept the third lowest tender, that of Messrs. Northcroft, Neighbour & Nicholson, the approximate total of which is £2,282. The expenditure will be a charge against the capital vote of £517,970 for the erection and equipment of the eleventh asylum.

THE Architect and Contract Reporter.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Oct. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARDIFF.—Aug. 6.—The Corporation invite designs and estimates in competition for a fire brigade station proposed to be erected in Westgate Street, Cardiff. The Corporation have appointed Mr. A. Marshall Mackenzie, architect, to act as assessor. The deposit of £2 2s. will be returned to all architects submitting bona-fide designs or who return the conditions within six weeks. Full particulars of the competition will be sent to the architects on application to Mr. J. L. Wheatley, Town Clerk, City Hall, Cardiff.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

GLASGOW.—The Corporation of the City of Glasgow invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

CONTRACTS OPEN.

ACKWORTH MOOR TOP.—Aug. 3.—For the whole of the works in the erection of stationmaster's house, four cottages, tranship shed, and weigh offices, for the Brackenhill Light Railway. The Resident Engineer, Ackworth Moor Top, Yorks., or Mr. William Bell, architect, York.

WREXHAM.—For the erection of twenty-nine houses. Mr. F. A. Bevan, architect and surveyor, Wrexham.

A ROYAL PENCIL.

For over a hundred years Messrs. E. Wolff & Son, Ltd., London, have been making pencils. As the climax of a century's effort to improve their own productions they now offer the "Royal Sovereign" as the finest fourpenny pencil on the market. It is made by a new process of toughening the lead, which gives a point of great durability combined with ease of erasure. The lead is so tough that it will rarely snap if accidentally dropped on the floor, and so even is the grain of the wood that a new point is made in a moment.

The "Royal Sovereign" is a triumph in pencil-making, and a great credit to a famous old British firm, who have been pencil manufacturers to the British Government and the Bank of England for generations, and who are by special appointment makers to H.M. the King.

It is interesting to note that in 1564 it was Englishmen who invented the first pencil, and that to-day it is a British firm which claims to have produced the finest pencil in the world.

LEWIS BROS., Gilfach Bargoed (accepted)	168	0	0

A RESIDENT in Scarborough has offered to provide the town with a motor fire engine and escape at a cost of 1,000 guineas. The offer has been gratefully accepted by the Town Council.

THE Birmingham Education Committee report that six new special schools for mentally defective children are needed in the following districts:—Anglesey Street, £5,500; King's Norton, £4,000; Reservoir Estate, Aston, £8,500; Greet, £4,000; Small Heath, £4,500; Mount Road, £4,000. The total cost is £30,500.

MR. R. M. LUCAS, F.R.I.B.A., Southampton, has prepared a revised design for the Pilgrim Fathers' Memorial proposed to be erected in Southampton Harbour at an estimated cost of £500. The design has been approved by the local committee, and will be proceeded with as early as possible.

A NEW body in the interests of pure water has been formed. It is called the Municipal Water Works Association, and it comprises members of town councils and other water authorities and also officials. The first president is to be Mr. Barnard, the chairman of the Metropolitan Water Trust, and the first vice-president Bailie Archibald Campbell, chairman of the Glasgow Water Committee.

THE Bradford Corporation Tramways Committee are considering two schemes for the provision of a central tramcar depot. The alternatives are the rebuilding of the temporary depots at a cost of £22,408, and the building of a new central depot costing £46,500. The tramways manager recommends the latter scheme as the best and most economical arrangement, and suggests the acceptance of an offer of a site at Longlands.

EXTENSIVE improvements to the Widnes and Runcorn Transporter Bridge, estimated to cost £8,675, have been decided upon by the Widnes Town Council. The consulting engineer advised the alteration of the driving system from direct electrical to rope haulage. The weight of the car would be reduced from 90 to 60 tons, and greater permanence would be given to the entire structure and reliability to the running. A quicker service will be possible—probably a ten-minute service in place of the present twenty-minute.

THE "ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

MEASURED DRAWING OF ANTIQUE GLOBE SUNDIAL.

(REMOVED FROM MAIDENHEAD.)

PERSPECTIVE
SKETCH.THE PEDESTAL IS
PORTLAND STONE.

E. H. GIBSON. JUNE 1912.

THE sundial shown in the drawing is one that we rarely see—namely, the globe type of dial. It was brought from Maidenhead, and nothing is known of its history. The pedestal is Portland stone, and the dial is set on a base of rough angular blue rock-like substance, which one might suppose to be concrete covered with small blue granite chips. On the top of the dial is a weather vane. This sundial is now at a Harrogate curio shop.

Rhewl.—"Drovers' Arms": alterations. Mr. J. Hughes (of Denbigh), architect.
Ruthin.—Four workmen's houses (£800).
Wrexham.—Ten cottages.
Ystradgynlais.—"Ynisedwyn Arms Hotel": additions.

SCOTLAND.

- Cathcart*.—Workshops at Holm Foundry, for Messrs. G. & J. Weir.
Duffus.—Board School.
Dunbar.—Gymnasium at the Barracks, Castle Park (£2,000). Messrs. Finlayson & Sons (of Leith), contractors.
Edinburgh.—House, Murrayfield Road, for Mr. J. Stewart.
Cooke's Circus, Fountainbridge: alterations into a picture theatre, for Mr. R. C. Buchanan.
Board School, King's Park, for 850 places (£12,500).
Stores at No. 130 Canongate, for Messrs. W. Younger & Co., Ltd.
Glasgow.—Twelve tenement houses, Woodcroft Avenue, Broomhill, for the Hyndland Building Co. (£25,000).
Four terrace houses, Kilmarnock Road, Newlands, for Messrs. G. Eadie & Sons.
Six terrace houses, Langside Road, Newlands, for Messrs. J. Allan & Son.
Glengarnock and Kilbirnie (between).—Board School.
Methil.—Premises, Harbour Wynd: additions and alterations for the Methil Co-operative Society. Mr. G. C. Campbell, architect.
Mylnefield.—Board School. Separate trade contractors.
Portsoy.—The Mills: additions for Mr. Ewing. Messrs. D. & J. R. McMillan, F.R.I.B.A. (of Aberdeen), architects.

IRELAND.

- Killough*.—Block of houses, water tower, engine house, &c., at the Charles Sheils Institution. Messrs. Young (F.R.I.B.A.) & Mackenzie (of Belfast), architects.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 14,695. June 21, 1911.—Improvements in concrete piles. J. M. Leighton, 4 Easton Crescent, Belfast. This invention relates to concrete piles of the kind constructed by driving a hollow preparatory pile or tube fitted while being driven with a loose point or shoe, which may or may not be recoverable, placing concrete in and withdrawing the tube, the concrete flowing out and filling the opening in the ground, the concrete, when set, forming the permanent pile. The

object of this invention is to construct the lower end of the permanent pile in such a manner that it may offer greater resistance to further penetration than if moulded throughout in the form of the tube and shoe. Figs. 3 and 4 show a pile with an enlarged flattened end. Fig. 3 shows the tube a

after it has been withdrawn a little. An expanding bore implement, *f*, is indicated by dotted lines as it is introduced down the tube, and by whole lines as it is when expanded after cutting away the earth at the sides of the hole forming the enlarged flattened end, *g*, to the pile. A non-recoverable point, *h*, is shown by dotted lines in the position it might occupy with relation to the base of the pile. The entire earth may be cut away, or the whole or any part of it may be allowed to remain to fill up the impression of the point. Fig. 4 shows the complete pile so formed. After having prepared the ground in the manner described, the concrete forming the pile is deposited and the tube withdrawn. The pile constructed in this manner must necessarily offer greater resistance to further penetration than it would if made in the form of the preparatory pile and point. June 19, 1912.

PATENT SPECIFICATIONS PUBLISHED JULY 11, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 14,439. June 19, 1911.—S. W. Edwards, 19 Sydney Road, Shirley, Southampton. Automatic electric fire alarm.
14,517. June 19, 1911.—H. W. Longdin, 10 Genoa Road, Anerley, Kent. Stone blocks for the paving of streets, roads, or the like.

14,696. June 21, 1911.—The Safety Tread Syndicate, Ltd., 15 Barbican, E.C., and E. S. Higgins, 21 Cornford Grove, Balham, S.W. Stair treads.

16,358. July 15, 1911.—Joseph Hollis, 1 St. Paul's Road, Leicester; George Scattergood, 104 Barclay Street, Leicester; and Albert Bailey, 16 Ashleigh Road, Leicester. Fire escape apparatus and lifting and lowering apparatus of general application.

18,117. Aug. 10, 1911.—Herbert Kohn, 158 Winterthurerstr., Zurich. Erection of brick walls and the like.

18,283. Aug. 12, 1911.—G. F. Ferns and W. G. Jackson, P.O. Box 211, Randfontein, Transvaal. Roof guttering support.

18,726. Aug. 19, 1911.—Robert Thompson, 11 Elborough Street, Southfields, S.W. Taps or cocks.

19,315. Aug. 29, 1911.—C. T. Lee, 9 West Side, Wandsworth Common, architect and surveyor. Construction of strong rooms, safes, and so forth.

20,673. Sept. 19, 1911.—T. A. Luke, 12 Brazennose Street, Manchester. Sliding ladders and tracks therefor.

21,007. Sept. 22, 1911.—William Hartell, 44 New Street, Henley-on-Thames. Fencing.

21,510. Sept. 29, 1911.—C. L. Newland, Victoria Villa, Cavendish Road, Merton. Device for automatically opening and closing window valves and the like.

25,317. Nov. 14, 1911.—E. C. Reynolds, 6 Manse Street, Dunedin, N.Z. Time locks.

25,969. Nov. 21, 1911.—J. B. Forster, 15 The Terrace, Merton Road, Wandsworth, S.W. Installation for extinguishing fires and for conducting away escaped gases, vapours and the like.

28,307. Dec. 15, 1911.—Incandescent Lighting and Stove Co. and J. Stubbers, Oakley Hamilton, Ohio, U.S. Atmospheric burners for stoves.

28,743. Dec. 20, 1911.—Date claimed under International Convention Dec. 22, 1910. Franz Kandler, Schloss Lannach, Steiermark, Austria. Roofing tiles.

29,029. Dec. 23, 1911.—F. W. Hinkel, 2 Louise, Henrietenstr., Tempelhof, near Berlin. Process and apparatus for extinguishing fire by means of dry powder.

1,781. Jan. 22, 1912.—W. B. Hughes, 330 High Street, Newark, New Jersey, U.S. Fire and temperature alarms.

1,961. Jan. 24, 1912.—Date claimed under International Convention Jan. 26, 1911. Soc. Generale des Nitrures, 12 rue Roquepine, Paris. Refractory blocks and bricks.

2,811. Feb. 3, 1912.—Henry Moat, jun., Bath Lane, Newcastle-on-Tyne. Method of strengthening or armouring ladders.

4,183. Feb. 19, 1912.—Anton Kleber, 5 Wilhelmstr., Saarbrücken, Prussia. Adjustable casings for the construction of walls by means of plastic materials.

5,044. Feb. 29, 1912.—W. A. Harrison, 32 Rosslyn Street, St. Michael's, Liverpool. Roller blinds or awnings.

5,456. March 4, 1912.—Date claimed under International Convention March 2, 1911. Friedrich Schwarz, 14 Ziethenstr., and Wilhelm Holthausen, 7 Antonienstr., Duisburg. Paving machines.

6,783. March 19, 1912.—Lips, Ltd., and J. H. Sains, Kingsway House, Kingsway, London. Safety locks.

8,244. April 4, 1912.—L. B. De Laitte, 73 Moorgate Street, E.C. Air carburetting apparatus.

8,881. June 19, 1911.—Domestic Appliances Co., Rochester, N.Y., U.S.A. Dust collectors and destructors.

A WAYGOOD EXTENSION.

In the record of any enterprise which has been steadily progressing during seventy and more years there could hardly fail to be certain red-letter days to serve as milestones along the road of prosperity. The firm of Messrs. R. Waygood & Co., Ltd., for instance, have, since the founder first came to London in 1840, many dates full of significance, both to themselves and in some cases to the general public also. When Mr. Richard Waygood had, in the thirties, built up a successful business in the West of England as a general engineer and maker of hot-water apparatus and stoves, he boldly transferred it to London. Twenty-three years later—namely, in 1863—the site of their premises was acquired by a railway company, and a move was made to Falmouth Road, S.E. A small piece of ground was then sufficient. Ever since that time the firm has remained in Falmouth Road, but their works have grown in spaciousness and efficiency with the years. The latest, but doubtless not the last, extension was successfully inaugurated on Tuesday last, when a splendid new building, with its galleries on first and second floors and a large basement, was declared open by the Mayor of Southwark. The cubic contents of this new building in conjunction with an older one to which it is attached are about 750,000 cubic feet. It is intended to concentrate in it the entire construction and fitting of the electrical output. The total capacity of the buildings at present occupied by the firm is 1,700,000 cubic feet. As Falmouth Road is a long one, we hope that the firm will be able to make yet further adjacent enlargements in the near future as their business increases.

The history of R. Waygood & Co., Ltd., contains, as already suggested, many points of public interest, for it synchronises with at least one branch of mechanical engineering. Up to about 1865 the chief manufactures at "Newington Ironworks" were presses, pumps, and machinery for treating rice, coffee, and Colonial products. But in that year Mr. H. C. Walker, M.I.M.E., the present Chairman and Managing Director, entered the service of the firm, and devoted special attention to lifting appliances, for which he foresaw a large possibility of development at the time. A commencement was made with hand lifts. The earliest lifts designed for raising persons were driven by winding gear and belts, but the application of hydraulic power for this purpose gave the first great impetus to the employment of passenger lifts. One of the earliest prominent installations in this country was the Grand Hotel, Charing Cross, opened in 1880, which was carried out by the firm. In 1893 Queen Victoria instructed Messrs. Waygood to put up a lift for her special use at Balmoral, which gave such satisfaction that instructions were given for similar lifts to be installed at Osborne, at Windsor, and also at Buckingham Palace. These were all worked by hand power. The honour of lift makers to the King was, by the way, given to the firm by both King Edward VII. and King George.

In recent years the most remarkable development has been in the employment of electric power for lifting purposes. The first electric lift erected by this company, which, it is understood, was the first made in this country, was exhibited at the Crystal Palace in the year 1890. Since that time they have given special attention to the development of this

class of work, and have now installed over 10,000 electric and hydraulic lifts of all kinds. They have made a special feature of automatic lifts, three of these being fitted in Buckingham Palace.

In 1901 the business was turned into a public limited liability company, with a capital of £300,000, of which £270,000 was subscribed. The employees in the various branches now number over 1,000, and the wages and salaries amount to nearly £100,000 per annum. The relations between employers and employed at Messrs. Waygood's have always been of a notably happy character. The sons and grandsons of the original partners are still actively associated in the business, while a pleasant feature of the proceedings last Tuesday was the warm cordiality of the staff towards the directors on the platform and towards three of the workmen, who received silver cups and a £10 note in recognition of more than half a century's service with the house of Waygood.

L.C.C. SCHOOL BUILDING.

THE Education Committee of the London County Council contemplate the acceptance of tenders during the approaching summer recess amounting to £228,309 on building work. They recommend that authority should be given to open the tenders and to accept the lowest satisfactory one in each case in order that the contractors may commence without delay, instead of waiting until the Council reassembles. The various works are as follows:—

1. Bethnal Green: Daniel Street.—Enlargement by 384 places.
2. Deptford: The "Ravensbourne."—New school for 768 children.
3. Greenwich: Randall Place.—Improvement and enlargement.
4. Hackney: Sigdon Road.—Enlargement by 384 places. Tottenham Road.—Reorganisation; Wilton Road.—New central school for 388 children.
5. Hackney: The "Craven Park."—Enlargement by 120 places; Oldfield Road.—Alterations for use as central school.
6. Haggerston: Brunswick Street (M.D.).—Enlargement by 25 places.
7. Islington: Elthorne Road.—New school for 100 physically defective children; Upper Hornsey Road (M.D.).—Enlargement by 50 places.
8. Kensington: Middle Row.—Rebuilding for 1,080 children.
9. Lewisham: Lewisham Bridge.—Rebuilding for 744 children.
10. Limehouse: Gill Street: Enlargement by 112 places; High Street, Shadwell.—New school for 100 mentally defective children and 100 physically defective children.
11. Mile End: Tollit Street.—New school for 125 physically defective, 150 mentally defective, and 80 deaf children.
12. Norwood: Caldecot Road.—New school for 854 children.
13. Paddington: Bravington Road.—New school for 75 mentally defective children.
14. Stepney: Senrab Street.—Enlargement by 256 places.
15. Walworth: Victory Place.—Rebuilding for 768 children.
16. Wandsworth: The "Furzedown."—New training college for 264 students, and hostels.

The Finance Committee support the recommendation, as the circumstances are exceptional. But they make an exception in the case of the "Furzedown" school at Wandsworth.

MR. W. G. R. SPRAGUE, architect, 10 Jermyn Street, W., has prepared plans for the proposed theatre in West Street, Shaftesbury Avenue, W. The premises will have accommodation for 660 persons.

THE annual agreement in the building trade, signed recently between the Employers' Association and the District Committee of the Glasgow and Suburban Branches of the Operative Masons' Society, this year provides for an increase of $\frac{1}{2}d.$ per hour being granted to the men. The advance will not take effect, however, until January 1, 1913. The present rate of wages is $9d.$ per hour, and the increase to $9\frac{1}{2}d.$ an hour, according to the agreement, is to be binding for six months until June 30, 1913. A request by the district committee that the working hours be reduced from 51 to 50 a week, so that the workmen might cease work at 12 o'clock on Saturdays instead of at one o'clock as at present, was withdrawn, as was also another request that in the event of disputes taking place throughout the year they be submitted to arbitration.

BIRMINGHAM'S NEW PICTURE GALLERIES.

ON Wednesday, the 17th inst., Birmingham's new art galleries were opened by Mrs. John Feeney, widow of the late Mr. John Feeney, proprietor of the *Birmingham Daily Post*.

The portion opened is in reality only half of a scheme for the purpose of which Mr. Feeney bequeathed the sum of £50,000; the other buildings will be opened in two or three years' time, and will consist of six or eight additional picture galleries and two large museums of casts. The old buildings, which are now used entirely for the display of objects of industrial and decorative art, with the exception of balconies containing drawings of the English pre-Raphaelite school and Burne-Jones, are connected with the new galleries by a bridge vestibule spanning Edmund Street.

This handsome entrance to the Feeney Galleries, as the ten new rooms are aptly styled, contains three pieces of tapestry executed by William Morris from designs by Burne-Jones. These new galleries form part of the large Council House Extension, an imposing building facing four streets, which was designed by Messrs. H. V. Ashley & Winton Newman, architects, 14 Gray's Inn Square, London, involving an outlay of, roughly, £200,000.

The quantity surveyors are Messrs. Hugh Watkins, 13 Gray's Inn Square, London, and Anthony Rowse, 117 Colmore Row, Birmingham.

The new picture galleries are spacious and simple apartments, entirely suited to their purpose. The pictures, all of which, with only one or two exceptions, are the property of the city of Birmingham, comprise one of the finest collections to be found, and the city is enormously indebted to Alderman the Right Hon. Wm. Kenrick, who for twenty-eight years has been Chairman of the Art Gallery Committee, and also other generous donors.

Great credit is due, too, to Sir Whitworth Wallis, F.S.A., Keeper of the Museum and Art Gallery, and his assistant, Mr. Arthur B. Chamberlain, who have worked so hard and enthusiastically for years.

It is a rare pleasure to see pictures hung to such advantage. The Burne-Jones room is, of course, specially attractive, and the well-known David Cox collection will always be one of Birmingham's much envied assets in the art world.

The works of T. M. Rooke, R.W.S., are of special interest to architects; also a few of Samuel Prout's paintings.

Names such as Turner, Rossetti, Watts, Millais, Holman Hunt, Madox Brown, &c., which are to be found in one room even, should be sufficient to attract lovers of the artistic from the farthest corners of the country to Birmingham's model galleries.

VARIETIES.

THE Burton Corporation Public Works Committee recommends the widening of the Trent Bridge from the recent extension up to Meadow Road. The work will be done with reinforced concrete, at an estimated cost of £7,000.

THE municipal authorities of Pilsen, Austria-Hungary, have approved the plans and estimate for the erection of an Industrial Academy at a cost of about £32,000. A college building will also be erected this year at Pilsen at a cost of about £78,000.

THE foundation stone of a new central railway station was laid a short time ago at Salonica. The station, which will cost about £140,000 to build, will be situated to the west of the city between the new harbour and the old Tophané Fortress.

THE demolition of some small houses on the south side of St. Bartholomew the Great, Smithfield, for the erection of warehouses has resulted in the exposing of the triple arched entrance from the cloister to the chapter-house.

THE Finance Committee of the Liverpool Corporation have had under consideration a report from the surveyor, giving the result of an interview between Sir William Goscombe John, R.A., and himself as to the proposed King Edward VII. memorial at St. George's Hall. The committee inspected a model showing the proposed alterations at the south end of the hall. The surveyor has just been authorised to invite tenders for carrying out the alterations in accordance with a resolution of the Council of December last.

THE Falmouth Town Council have resolved that Mr. Cummings be engaged to give a preliminary report with estimate to deal with the sewage disposal of the borough so far as it affects the foreshore of the harbour, at a fee of fifty guineas and travelling expenses.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, etc., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Oct. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARDIFF.—Aug. 6.—The Corporation invite designs and estimates in competition for a fire brigade station proposed to be erected in Westgate Street, Cardiff. The Corporation have appointed Mr. A. Marshall Mackenzie, architect, to act as assessor. The deposit of £2 2s. will be returned to all architects submitting bona-fide designs or who return the conditions within six weeks. Full particulars of the competition will be sent to the architects on application to Mr. J. L. Wheatley, Town Clerk, City Hall, Cardiff.

Works: FALKIRK, N.B.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

GLASGOW.—The Corporation of the City of Glasgow invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

CONTRACTS OPEN.

ABERDARE.—July 30.—For erection of two cottages, Llwyd-coed, Aberdare, and the construction of a private road to same. Mr. E. C. P. Monson, F.R.I.B.A., F.S.I., M.S.A., Finsbury Pavement House, London, E.C.

MATTOCK BROS., Wood Green (recom- mended)	9,987	0	0

On July 3 and 17 Mr. W. Noble Twelvetrees delivered
two lectures on "Reinforced Concrete" to the students of
the Crystal Palace School of Practical Engineering. The
first lecture dealt with the fundamental principles of rein-
forced concrete construction and the general theory of beam
design. The second lecture was devoted to the principles
underlying the design of columns, struts, arches, and other
forms of structural elements, and to various aspects of prac-
tical construction in reinforced concrete. This lecture was
illustrated by specimens of various types of reinforcing steel,
as well as by models and photographs of works executed in
the United Kingdom.

CONCRETE BLOCK DWELLINGS IN EARTHQUAKE DISTRICTS.

THE district of Calabria has always been more or less subject to earthquakes. The cause is not believed to be Vesuvius, but the island volcano of Stromboli, which is the nearest, and is in constant activity. In the winter of 1905 the province was devastated to such an extent that it was necessary to go back to 1728 to find a parallel. The unhappy condition of the population was accentuated by the fact that all the villages are perched high on the hills, owing to the malaria of the plains, and they had to seek refuge in sheds while exposed to the extreme cold of high mountains.

The problem of rehousing the inhabitants proved a difficult one. An interesting question arose at once as to the

advantages. Of the numerous hollow concrete block machines available the engineers to the committee selected the "Phoenix," which is the patent of Dr. Gaspary & Co., Machine Works, Markranstaedt, near Leipzig. Its great recommendation was simplicity of working. This portable machine is so constructed that the block can be placed direct from the mould on to the floor. Not only hollow and solid blocks, but also longitudinally and transversely divided half-blocks (with smooth or rusticated surfaces) can be made with this machine. The sizes of the blocks may be varied from nine to sixteen bricks. Our first illustration shows a street in the earthquake districts, and the other the adaptability of the block to various typical uses. No. 1 represents an ordinary hollow wall block with a groove down each end, into which cement is run after the blocks have been put

most suitable form of construction. Italian engineers looked for guidance to the United States. It will be remembered that after the San Francisco earthquake it was found that concrete and reinforced concrete buildings had survived the shock in a most remarkable manner. After due deliberation it was decided by one of the local committees (the Comitato Veneto-Trentino "Pro-Cala-

together (fig. 9). Fig. 10 shows how the blocks are joined together—one hollow fitting over the other, so that long air spaces are formed. Fig. 8 represents a block which is provided with notches to allow a good connection of the outer walls with thin partition walls. The other illustrations show half-blocks and the manner in which the door and window jambs are securely joined to the blocks.

bria") to employ hollow concrete blocks, as being cool in summer and warm in winter, economical in material, cheaply and quickly erected, as well as having hygienic and other

THE Carborundum Co., Ltd., manufacturers of abrasive materials, have selected Manchester as the most suitable site for their proposed new works.

THE dispute between the Baths Committee of the Manchester Corporation and the painters on the question of painting work being done by bath attendants was last week considered at a special meeting of the Baths Committee, at which a deputation of the painters' representatives attended. The committee decided that they would suspend any painting work by their attendants until next July, and would then reconsider the question. It is thought that the dispute may be brought to an end, and that the men who have been withdrawn by trade unions from work on the new baths at Withington, schools at Beswick, Boyle Street (Queen's Road), and Gorton, and at the Gorton baths, will be allowed to resume work.

CEMENT INDUSTRY IN AUSTRIA.—The following information is from the report of H.M. Vice-Consul at Ragusa (Mr. W. N. L. Shadwell) on the trade of Dalmatia in 1910-11:—There are four cement factories in Dalmatia, situated at or near Spalato. After having suffered for several years from the acute crisis through which the Austrian cement industry passed, the Dalmatian works are now, thanks to the "combine" in which they are associated with the other Austrian cement factories, doing satisfactory business. In 1911 the Dalmatian works produced 217,000 metric tons of cement, while the amount exported, according to the official statistics for 1910, the latest available, was 87,054 metric tons; in 1911, a much larger quantity must have been exported. Dalmatian cement is shipped to Trieste and to other ports along the Austrian coast, and also to Egypt, Turkey, Argentina, Brazil, India, and Russia. Vessels of the Austro-Americana Line call at intervals at Spalato to load cement for South American ports. Calcium carbide is manufactured at Sebenico, the electricity required in the process being obtained from the Krka Falls; 16,000 metric tons are produced yearly.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

BERKSHIRE.

Burghfield.—Mrs. Bland's School: Handicraft and Cookery Centre.

Chaddleshworth.—Saunders' Charity Endowed School: improvements.

Shinfield Grazeley.—School enlargement.

Thatcham.—C. of E. School: improvements.

Wantage.—Wesleyan School: improvements.

BUCKINGHAMSHIRE.

Ashley Green.—Two cottages for Mr. J. Hardeon.

Calvert.—Twelve cottages for the Brickworks Company.

Chalfont St. Peter.—House, Packhorse Road, Messrs. Castle & Warren (of London), architects.

Chesham Bois.—House, Stubbs Wood Road, for Messrs. Child & Watts.

House, The Common, for Mr. H. Kennard.

Lee.—School, The Common: additions and alterations. Messrs. Kemp & How, F.F.R.I.B.A. (of London), architects.

Little Kingshill.—House, Stoney Field, for Mr. A. W. Nash.

Penn.—House, Knotty Green, for Mr. P. S. Webb.

Twyford.—Working-class houses for the R.D.C. (£1,100).

CORNWALL.

Fowey.—Cottage Hospital.

Helston.—County School extensions, Penrose Terrace.

St. Columb.—House, Blackcross, for Mr. H. J. Rowse.

Two houses, Queens, for Miss Chapman.

House, Watergate Bay, for Mr. R. Cleave.

CUMBERLAND.

Ousby.—Council School: enlargement. Mr. C. M. Wilford (of Carlisle), architect.

DEVON.

Devonport.—Borough Hospital: extension.

DURHAM.

Low Heworth.—Church Hall and School (£1,400). Mr. C. S. Errington, A.R.I.B.A. (of Newcastle-on-Tyne), architect. Mr. W. Foster (of Pelaw), contractor.

ESSEX.

Ford End (Chelmsford).—Council School: alterations. Mr. N. J. Dawson, A.R.I.B.A., architect.

Orsett.—Workhouse Women's Infirmary.

Rayleigh.—Cottage Hospital.

Romford.—Victoria Cottage Hospital: King Edward VII. Memorial enlargement.

Southend-on-Sea.—Two bungalows, Cliffsea Grove, for Mr. F. W. Goldsworthy.

Two bungalows, Eastwood Lane, for Mr. H. Lummis. Business premises, The Broadway, High Street, for Messrs. Teller & Goldberg.

Two cottages, North Avenue, for Mr. J. Ward.

Two houses, Cumberland Avenue, for Mr. W. Brand.

Eleven houses, Fairmead Avenue, for Mr. R. J. Snell.

Two houses, Fleetwood Avenue, for Mr. M. Kempen.

Two houses, Hainault Avenue, for Mr. A. J. Cross.

Six houses, Hainault Avenue, for Mr. T. Ridd.

Seven houses, Macdonald Avenue, for Messrs. Wells & Barham.

Eight houses, Porter's Grange Avenue, for Mrs. E. J. Adams.

Seven houses, Fairfax Drive, for Mr. C. Young.

Two houses, Northview Drive, for Mr. W. T. Wilson.

Three houses, Westcliff Park Drive, for Mr. Kibbey.

Six houses, Westcliff Park Drive, for Mr. Whitby.

Two houses, Somerville Gardens, for Messrs. Wray & Cobb.

House and garage, Ailsa Road, for Mr. S. Adams.

House, Cobham Road, for Mr. F. Poole.

House, Cossington Road, for Mr. A. J. Bond.

Two semi-detached houses, Fermoy Road, for Messrs. J. Sumner & Co.

House, Lonsdale Road, for Mr. P. Stanton.

Two houses, Westborough Road, for Mr. R. G. Rudd.

Conversion of house into shop. No. 59 Leigh Road East, for Mr. Cox.

House and shop, Bournemouth Park Road, for Mr. J. Sears.

House and shop, Westborough Road, for Mr. A. E. Rudd.

Houses and shops, corner of West Road and Westborough Road, for Mr. R. Alabaster.

Houses, shop, and stabling, Westborough Road, for Mr. T. Heal.

Five houses, Beaufort Street, for Mr. T. Matthews.

Parish Hall, Leigh Road, for the clergy of St. Michael's and All Angels.

Theatre, Leigh Road. for Raymond Animated Picture Co.

GLOUCESTERSHIRE.

Bristol.—(Supplementary to July 12.) Fine Arts Academy: alterations. Mr. S. S. Reay, F.R.I.B.A. (Messrs. Silcock & Reay, of Bath), architect.

Kingswood.—Picture Hall, Regent Street.

Long Ashton.—University of Bristol Agricultural Institute: additions and alterations (£10,000).

Tewkesbury.—Girls' High School: additions and alterations.

Winchcombe.—Workhouse: alterations (£2,100).

HAMPSHIRE.

Basingstoke.—Cemetery buildings. Mr. J. Harris, contractor.

Bournemouth.—Infectious diseases hospital: accommodation (£1,500).

KENT.

Beckenham.—Three houses, Oakwood Avenue, for Mr. J. Andrews.

Two houses, Stanley Avenue, for Messrs. J. Copland & Son.

Lodge, Kelsey Park, for the U.D.C.

LANCASHIRE.

Bolton.—Picture palace, Blackburn Road, for Mr. W. F. Bowen.

Congregational School, Derby Street: alterations.

St. Edmund's Catholic School, St. Edmund Street. Mr. T. E. Smith, architect.

Turton.—Weaving shed for 400 looms for the Mill Building Limited Liability Company (£12,000).

LEICESTERSHIRE.

Market Harborough.—Board of Guardians: Children's Homes.

LINCOLNSHIRE.

Gedney.—Working-class dwellings.

Woodhall Spa.—Farm buildings, near Manor House, for Mr. S. V. Hotchkiss.

Cottage, Stixwold Road, for the National Service Pensioners' Freehold, Ltd.

Pair of Cottages, Witham Road, for Messrs. Kirkby & Pycroft, Ltd.

MONMOUTHSHIRE.

Caerleon.—Monmouthshire Training College.

NORFOLK.

Norwich.—Municipal Offices, Fish Market site (£12,800). City engineer.

NORTHAMPTONSHIRE.

Ravensthorpe.—Pumping station: extensions. Also cottage for the Northampton Corporation.

SOMERSET.

Corston.—Church Hall and Institute.

Taunton.—St. James' Church: restoration (£650).

Weston-super-Mare.—Cinematograph theatre, Waterloo Street, for Mr. F. Aldridge.

Electric theatre (conversion). Mr. P. G. Fry, architect.

STAFFORDSHIRE.

Bilston.—Council school, Princes End, Coseley.

SURREY.

Epsom.—Lunatic Asylum.

Walton-on-Hill.—House for Rt. Hon. D. Lloyd George, M.P.

SUSSEX.

Brighton.—Theatre, Holland Road, Hove, for the National Education Amusement Company, London.

Burgess Hill.—Southdowns Hydro Hotel: new wing.

Crowborough.—Garage and two cottages; also

Lewes.—Alterations to two houses; also

Rottingdean.—House; also

Seaford.—Three houses. Mr. R. H. Halls (of Lewes), architect.

Shoreham.—Council Schools, Swiss Gardens.

WILTSHIRE.

Potterne.—Twelve cottages for the Devizes R.D.C.

YORKSHIRE.

Bradford.—Two blocks of single-room dwellings, Longlands area. City architect.

Test Workhouse, Daisy Hill. Mr. F. Holland, architect.

YORKSHIRE—continued.

Bridlington.—Twenty-five workmen's cottages (£4,700).

Halifax.—Wesleyan Chapel, West End. Messrs. Longbottom & Culpin, architects.

Ilkley.—King's Hall: Annex. Council surveyor.

Penistone.—Council Offices and Public Hall (£3,500).

Sheffield.—Eyre Memorial Church, Newhall.

Silsden.—Council School. Education architect (County Hall, Wakefield).

WALES.

Clydach.—Mond Nickel Silver Works: extensions.

Denbigh.—Markets, public hall, fire brigade station, &c. Messrs. Porter & Elcock (of Colwyn Bay), architects.

Llanengrad.—Council School: additions and alterations.

Mr. J. Owen, F.R.I.B.A., (of Menai Bridge), County architect; also

Menai Bridge.—Council school.

Port Talbot.—Theatre, Exchange, shops, and offices. Mr. B. Jones (of Swansea), architect.

Swansea.—Six mills, King's Dock, for Messrs. Baldwin & Co.

Tinplate Warehouse, King's Dock, for the Harbour Trust (£2,000).

SCOTLAND.

Aberdeen.—Public School, Ashley Road: extension. Mr. J. A. O. Allan, architect.

Buckie.—House, West Street. Mr. W. Hendry, architect.

Cockburnspath.—School. Messrs. Gray & Boyd (of Berwick-on-Tweed), architects.

Edinburgh.—University: Department of Forestry, Agriculture, and Entomology: buildings (£12,000).

Fraserburgh.—Additions and alterations in Mid Street. Mr. W. E. Gauld, A.R.I.B.A., architect.

Leith.—Picture theatre for 2,000 seatings, Duke and Constitution Streets.

IRELAND.

Farran.—House. Mr. J. D. Leahy (of Newcastle West), architect.

Shangarry (Co. Carlow).—Medical Officer's house; also dispensary. Guardians' engineer.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 11,375. May 11, 1911.—Improvements in or relating to carburetting apparatus. J. H. Hopkins, 38 Cooke Street, Old Trafford, Manchester, and A. M. Stansfield, 31 Broom Lane, Levenshulme, Manchester. This invention relates to improvements in apparatus for manufacturing gas from petrol or kindred spirit, adapted to give a continuous supply of gas and an equally continuous supply of air for use in the manufacture of such gas. The apparatus is used in connection with a Robinson type of hot-air engine or a hot-air engine having a trunk piston. An air-compressing chamber is employed in direct communication with the open end of the cylinder, and surrounding the main working parts of the engines. Fig. 1 is a front elevation. Fig. 3 end elevation partly in section from the left hand end of the apparatus. The engine, *a*, has an air-compressing chamber, *b*, forming part of the bed, *c*, of the engine, such chamber being located close to the open end of the trunk piston, *d*. The chamber also surrounds the driving or fly wheel shaft, *e*. The air inlet valve, *f*, and the air outlet valve, *g*, are of the self-weighted type. The air inlet valve *f* communicates from the air-compressing chamber *b*, with a smaller chamber, *h*, provided with an attachable connection, *i*, for the admission of air, the outer end of such connection being provided with a filtering cloth wire gauze, *j*. The air outlet valve, *g*, from the air compressor, *b*, allows the air to pass to a baffling device to give even pressure and flow of air to the carburettor, *k*. The device consists of a tubular structure comprising two or more tubes, two being indicated in fig. 3, one of which, *m*, may be plain and the other, *n*, perforated. The tube *m* is in communication with a small chamber, *o*, arranged above the outlet valve, *g*. The trunk piston, *d*, is coupled by a rod, *q*, to links, *r*, which, in turn, are connected to crank disc 4 and to a lever, *s*, pivoted at its opposite end to the top of the cylinder *u*. The lever *s* is coupled by link *t*, pivoted at *v* to a rod, *w*, connected to a diaphragm

located in the vertical tubular structure, *x*, below which is situated a circular chamber, *y*, provided with a hole, *z*, at its bottom side, through which a gas burner, 2, passes so as to allow its flame to be diffused against a metal dish, 3, located within the chamber *y*. The heated air in the structure *x* is conducted by a suitable passage to the cylinder *u* behind the piston *d*. 4 is the fly-wheel of the engine on the

Fig. 1

shaft *e*. The compressing chamber, *b*, is for the purpose of compressing air and forcing it into the carburettor *k*, so as to become intimately associated with the petrol. The fly-wheel, 4, is adapted to run in an oil bath, 5, formed in the

Fig. 3.

base or bed, *c*, of the engine, and 6 is a plug connected with the oil bath to enable the height of the oil to be regulated as desired. The revolution of the fly wheel causes oil to be

picked up and to be splashed on the working parts of the engine located within the compressing chamber *b*, and in order to keep such working parts cool the chamber may be surrounded by a water-jacket, *7*, which may be filled through the plug hole, *8*, at its upper side. The discharge end of the air pipe, *p*, has a number of short outlet branches, *9*, adapted to dip into the petrol contained within the carburettor chamber. The outlets of these pipes distribute the air throughout the whole body of petrol. The petrol is supplied to the carburettor from the cistern or tank, *10*, by way of a valve-controlled pipe, *11*, and float chamber, *12*, these parts being of the usual type. *13* is the gasometer bell, *14* the water tank or chamber within which it is located, *15* a gas pipe connected with a carburettor, *k*, and passing towards the upper portion of the bell, *13*, where it is provided with the usual back pressure valve, *16*, to prevent the gas being forced back into the carburettor. An ordinary gas supply pipe, *21*, communicates with the gas burner service. June 19, 1912.

PATENT SPECIFICATIONS PUBLISHED JULY 18, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 14,791. June 26, 1911.—Alfred Phillips, Claremont, Goldthorn Hill, Wolverhampton. Moulding machines.

15,099. June 28, 1911.—F. G. Lynde, "Woodside," London Road, Knebworth, Herts., and E. R. Calthrop, Eldon Street House, Eldon Street, London. Construction of sea walls, piers, pontoons, floating stages, foundations, and other structures.

15,639. July 5, 1911.—A. E. Lamkin, 226 Mitcham Road, Croydon, Surrey. Heating kitchen ranges and the like by gas.

15,870. July 8, 1911.—Mrs. M. E. Cambell, Walter Cambell, architect, and Alexander Pryde, all of 22 Springfield Road, Gatley, Cheshire. Construction of domestic hearths.

16,906. July 24, 1911.—Bertram and Eustace Thomas, Worseley Street, Hulme, Manchester, and E. M. Holme, Beech House, Adwood Lane West, Stockport. Electrically operated cranes or other raising and lower machinery.

16,989. July 25, 1911.—D. E. Davies, Volvac Works, Highgate Road, Birmingham. Appliances for cleaning by vacuum.

17,608. Aug. 2, 1911.—F. G. S. Ham, 13 Grosvenor Road, Westminster. Apparatus for use in sweeping up or scavenging roads, paths, &c.

18,153. Aug. 10, 1911.—C. J. Harvey and the Harvey Pneumatic Cleaners Co., Ltd., 11 High Street, Kidderminster. Operating mechanism of vacuum cleaners or dust extractors of the type employing two or more exhausters.

19,183. Aug. 26, 1911.—C. O. Stinebaugh, 2952 First Avenue South, Seattle, King, Washington, U.S. Cement compositions for making concretes and the like.

19,235. Aug. 28, 1911.—Date claimed under International Convention Nov. 29, 1910. Soc. Drouard Freres, 2 bis Boulevard Jean d'Arc, Rouen, Seine Inferieure, France. Stone-breaking machines.

19,682. Sept. 4, 1911.—C. E. Rose, 861 Ninth Street, San Diego, California, U.S. Door gauges.

20,158. Sept. 11, 1911.—R. W. O. Coombs, 110 Stamford Hill, N. Plug taps or cocks.

20,587. Sept. 18, 1911.—G. T. Money, 16 Leatherdale Street, Globe Road, Mile End Road, E. Safety guard for the cutters of wood moulding machines.

20,629. Sept. 18, 1911.—John Algermisen, St. Paul, Missouri, U.S. Revolving chimney top.

20,772. Sept. 20, 1911.—J. E. Flynn, Norman Road, Birkby, Huddersfield. Chimney pots and ventilator shafts.

21,262. Sept. 26, 1911.—Arthur Bing, rue St. Sebastien, Paris. Burglar alarm device.

21,301. Sept. 27, 1911.—T. A. Helm, 4 Leaver Street, Rosegrove, near Burnley, Lancaster. Fastenings for the doors or gates of yards.

22,318. Oct. 10, 1911.—H. J. Cowell, 14 Leonard Street, City Road, E.C. Fire escapes.

24,055. Oct. 31, 1911.—W. D. Kelly, 6222 Winthrop Avenue, Chicago, Cook, Illinois. Wood working machine.

24,631. Nov. 6, 1911.—P. R. Seamon, 137 Hutchings Street, Roxbury, Boston, Suffolk, Mass. Automatic gas lighting and extinguishing apparatus.

26,805. Nov. 30, 1911.—G. E. Montagnon, 83 Malpas Road, Brockley, S.E., and Frederick Atkinson, 49 Queen

Victoria Street, E.C. Fireproof floors and partitions constructed in reinforced concrete.

142. Jan. 2, 1912.—Date claimed under International Convention Jan. 2, 1911. J. von Vass, 11 Reichenbachstr., Dresden. Methods of and means for raising and forcing semi-fluid mixtures of materials, such as cement, lime, and the like.

2,483. Jan. 31, 1912.—G. W. Drummond, The Bayham Moulding Works, 53a Bayham Street, Camden Town, N.W. Guards of moulding and like machines.

3,815. Feb. 15, 1912.—James Farley, Cecil House, Hertford. Distribution of sewage.

4,770. Feb. 26, 1911.—C. H. Triggs, 64 Teignmouth Avenue, Earls Court, York, Ontario. Window sashes.

5,082. Feb. 29, 1912.—W. N. Jones, Dyffryn, Ammanford, Carmarthenshire; J. R. R. Thomas, 73 Wind Street, Ammanford, Carmarthenshire; Percy Lloyd, Patent Works, Ammanford, Carmarthenshire; and J. F. Burns, Bellevue House, Station Road, Ystradygynlais, Brecknockshire. Manufacture of bricks.

6,255. March 13, 1912.—Date claimed under International Convention March 14, 1911. Frederick Oppenheim, 73 St. George's Square, Westminster. Shelf supports.

6,955. March 21, 1912.—J. H. Nicholas, 5 The Villas, Sudbrook, near Chepstow, Mon. Sanitary equipment for earth closets.

7,297. March 25, 1912.—Robert Hudson, Gildersome Foundry, near Leeds. Glazing and ventilating of buildings or structures.

13,012. June 3, 1912.—L. F. Thompson, Clinton, Iowa, U.S. Shovel handles.

NEW CATALOGUES.

MESSRS. OZONAIR, LTD., 96 Victoria Street, Westminster, S.W., have prepared a new edition of their catalogue No. 1 "Ozonair Apparatus for General Purposes." Its twelve pages contain illustrations, prices, and other particulars of Ozonair portable generators capable of purifying the air in rooms of from 3,000 to 12,000 cubic feet capacity, for connecting the supply circuits or to portable accumulators. These apparatus are made in a variety of patterns, for standing on the table, for fixing on the wall, with medical fittings, &c. The consumption varies from only 10 watts to 130 watts, so that in all cases where intended for use on a supply circuit they can be connected to any lampholder or plug. The makers claim that their Ozonair apparatus, as compared with other methods, are noiseless, and generate pure ozone free from the oxides of nitrogen. Interesting information is included regarding the nature of ozone and the many public and industrial purposes to which the apparatus can be applied. That these uses are not hypothetical is proved by a list of important users in many different parts of the world, comprising public buildings, breweries, slaughter-houses, cold storage, water-works, laboratories, and so on. Messrs. Ozonair, Ltd., will be pleased to send a copy of the catalogue to anyone interested in the subject.

A concise handbook has recently been issued by Fredk. Braby & Co., Ltd., Glasgow, which should prove extremely useful to those interested in the iron and steel building trade, and serve as an excellent supplement to their large illustrated catalogue, of which a new edition was published this year. The "Eclipse" iron and galvanising works and steel sheet rolling mills occupy a large area in Petershill Road, with their many departments and shops, and of these some interesting views are given. The range of manufactures includes wrought-iron and steel buildings of every description, hot-water cylinders, and wrought-steel windows and gutters. A special feature is made of Braby's galvanised corrugated sheets, which have earned a wide reputation. The handbook contains a very considerable amount of information which is essential to architects concerning the weights, specific gravity and fusibility of zinc and iron, as well as illustrations of the many products of this firm. Another prominent feature of this catalogue deals with Braby's steel and gun-metal casements and sashes. These are made to almost any size and design, and are guaranteed waterproof under all conditions.

THE object with which Thomas Faldo & Co., Ltd., Effingham House, Arundel Street, W.C., put forward their small twelve-page booklet, "A Few Simple Facts about Asphalte," are frankly set forth in their own foreword. It runs as follows: "This little book is published, primarily and particularly, for the information of buyers and users of asphalte, to help architects, engineers, surveyors, and others in the selection of the best description of asphalte for any

purpose; also in the hope that it may bring us more business. We realise that asphalt is an article about which little is known to most users, so we have tried to cover the subject thoroughly, yet briefly." Messrs. Faldo are not mine-owners, but they have direct, and in some cases exclusive, contracts with the various mines; and they manufacture almost every kind of asphalt in their own works at Rotherhithe, including British, Special British, Acid-resisting, Seyssel, Limmer, and Refined Trinidad Bitumen. Asphalt is divided into two classes—viz. Foreign and British. The first is a natural product; the second is a manufactured article sold at about half the price. Messrs. Faldo say that British asphalt, if properly made, cannot be surpassed for such work as damp courses; and when they advise its use they are always willing to give a written guarantee. The firm, however, are in a position to supply genuine Seyssel, Limmer, or other foreign asphalt, as they are to supply British made by their own patent process. Their work has behind it the not inconsiderable force of sixty years' reputation, gained in many different parts of the country. Included in this booklet will be found a variety of instructive and valuable information, which should clear up many common misconceptions.

MESSRS. MATHER & PLATT, LTD., Manchester and London, are the original makers of turbine pumps, and have now had over thirty years' experience with them. Since the first patent was taken out in 1875 there have been, of course, striking developments, and the turbine has made unceasing inroads into the former monopoly of the centrifugal pump. The world-wide known firm have recently issued a new turbine pump catalogue, which admirably indicates the diverse applications of Professor Reynolds' patent. These include sanitary, fire and marine services, power auxiliaries, waterworks, colliery and mining, and many industries. The pumps have been made for quantities up to 15,000 gallons per minute, for heads up to 1,600 feet, and for speeds up to 3,000 revolutions per minute.

THE BRITISH FIRE PREVENTION COMMITTEE'S SUMMER MEETING.

THE British Fire Prevention Committee commenced its two-day summer meeting on Wednesday morning at its Regent's Park Testing Station with some important high-temperature fire tests on a reinforced concrete floor and on six sets of electro-glazed casements.

There was a large attendance of members and subscribers, and a number of visitors, including Chief Officer Troje, representing the Prussian Fire Service Council, while the Admiralty, War Office, Home Office, and other Government Departments, as also the London County Council and several municipal and similar authorities were represented by their principal officials concerned, together with a number of railway and insurance companies.

The members and visitors were received by the Earl of Lonsborough, K.C.V.O., Sir Henry Tanner, C.B. (H.M. Office of Works), Sir James Szlumper, M.Inst.C.E., Mr. Edwin O. Sachs, F.R.S.Ed. (Executive Chairman), Mr. Horace Folker, F.A.I. (Hon. Treasurer), and other members of Council, and the testing operations were conducted by strong Sub-Committees under the general direction of Mr. Ellis Marsland (General Hon. Secretary).

The arrangement of the reinforced concrete floor test has awakened considerable interest, as it is the first occasion that a floor of this type, reinforced solely with a mesh reinforcement (a triangle mesh), was under official review, and the question of whether for such floor with mesh reinforcements a lesser amount of protective covering would suffice is a much-discussed problem from the fire point of view.

Again, the arrangement of the test with electro glazing of the so-called "Chadrac" type has awakened great interest, seeing that the "Copperlite" type, which was recently tested, had obtained a very high record, and that other makers are also testing to the same high standard.

As to the results of the first day's test they will be published in the usual illustrated reports of the Committee in due course.

As we go to press the second day's testing operations are in hand, when another form of electro glazing is under review—i.e. "Luxfer" glazing, and some Belgian double reinforced concrete doors. The "Luxfer" glazing, it should be mentioned, had been tested to the earlier standards some time back.

TRADE NOTES.

THE "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Baptist Church, Broadstairs.

THE Bishop Eton Monastery, Woolton, is being supplied with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

MESSRS. J. WRIGHT & Co., of South Western Works, New Malden, Surrey, and Crown Chambers, Regent Street, S.W., have appointed Messrs. Ellis, Partridge & Co., of Grey Friars, Leicester, sole agents for the county of Leicestershire for the sale of their partitions (hollow and solid fixing blocks) for walls, tilehanging, and for floors on concrete, &c. Messrs. Ellis, Partridge will hold stocks, and be thereby enabled to supply on demand.

VARIETIES.

THE Eastern District Committee of the Haddingtonshire County Council have decided to provide a new water supply for Innerwick, and steps are now being taken to have the scheme carried out.

SIR CHARLES ASSHETON-SMITH has made a liberal offer regarding the building of workmen's dwellings in a district adjoining Dinerwic Quarries, Carnarvon, of which he is the owner, to obviate the necessity of the District Council carrying out a building scheme. Sir Charles is prepared to sell to individuals a plot of freehold land provided not less than twenty houses are erected upon it. The price asked is £3 per house, or 4d. a yard, provided that the plans and construction of the buildings are approved of by the local rural council.

A LOCAL GOVERNMENT BOARD inquiry was held at the Castle of Winchester last week by Mr. H. R. Hooper, M.I.C.E., into an application to borrow sums of £171,009, £136,808, and £49,600 by the Hants County Council, the borough of Southampton, and the borough of Bournemouth respectively, being their respective portions of the cost of erecting a joint asylum at Park Brewett, Sherborne St. John, near Basingstoke. The reason for the erection of the new asylum is the overcrowded state of the Fareham institution. Mr. Neville Hine attended on behalf of the architects of the new buildings.

RETURN tickets at reduced fares, available for fourteen days, will be issued to Brussels, via Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning, after a comfortable night's rest on board the steamer. For visiting Holland special facilities are offered by the British Royal Mail Harwich-Hook of Holland route. From the Hook of Holland through carriages and restaurant cars are run to The Hague and Amsterdam in the North and South German express trains to Cologne, Bale, Hamburg, Halle (for the Harz Mountains), Dresden, and Berlin. The Danish Royal Mail steamers of the Forende Line of Copenhagen will leave Harwich for Esbjerg on August 2 and August 3. The General Steam Navigation Company's steamers will leave Harwich for Hamburg on Wednesday, July 31, and August 3. The Swedish Royal steamer will leave Harwich for Gothenburg on Saturday, August 3.

SPECIAL excursion tickets will be issued by the South Eastern and Chatham Railway to Paris by the services leaving Charing Cross at 10 A.M. and 2.10 P.M. on August 1, 2, 4, and 5, and at 10 A.M. and 2.50 P.M. on Saturday, August 3. They will also be issued by the night mail service leaving Charing Cross at 9 P.M. each evening from August 1 to 5, inclusive, returning from Paris any day within fifteen days. Cheap tickets to Brussels by the Calais, Boulogne, and Ostend routes will be issued from July 31 to August 5, inclusive, available for fourteen days. A special service will leave Victoria at 4.55 P.M. for Folkestone, Boulogne, Ste. Cécile, and Le Touquet on Friday, August 2, returning on Tuesday, August 6. A cheap excursion to Boulogne will leave Charing Cross at 2.50 P.M. on Saturday, August 3, returning on Bank Holiday. Cheap return tickets, available for eight days, will be issued at Charing Cross from July 31 to August 5 inclusive. Similar tickets will also be issued to Calais. On Sunday, August 4, and Monday, August 5, special day excursions will be run to Boulogne and Calais. Special cheap eight-day return tickets to Amsterdam and Scheveningen, The Hague, and other Dutch towns will be issued from July 31 to August 5, inclusive. Cheap eight-day return tickets to Ostend will be issued from July 31 to August 5, inclusive. Special cheap tours to the Belgian Ardennes by the Calais, Boulogne, and Ostend routes are also announced. During the holidays the Continental services will run as usual.

WEEK-END COTTAGES, BUNGALOWS, AND OTHER SMALL HOUSES.

DESIGN NO. 50.

THIS month's special supplement contains a further series of designs of varied plan and treatment, and the Editor of *The Architect* will be pleased to introduce the authors to those who desire to build from these designs or a modification of them.

ENTRANCE FRONT.

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

The main feature of this house is the utilisation of as much of the interior space as possible in the living room, which would be exceedingly spacious for the size of the house and would also be very picturesque. By means of curtains it would be possible to close off the thoroughfare and to subdivide the room if desired. At the same time by means of a small servery, communication between kitchen and dining-room is easy without loss of privacy. It is suggested that the bedrooms should be warmed by hot-water radiators, worked from the downstairs rooms. The house is intended to be built of rustic-faced brick with stone bands and dressings, relief being obtained by half-timber above. The roof would be covered with tiles in pleasant low-toned colours. The cost is estimated at £750.

DESIGN NO. 51.

ENTRANCE FRONT.

GROUND FLOOR PLAN.

This is a house planned for a corner site, and a large lounge hall virtually makes a fourth reception room to the usual dining, drawing and morning rooms. The kitchen and offices are exceptionally well arranged and a servants' stair and serving pantry make the service quite independent of the living part of the house. The house is intended to be finished externally in rough-cast with purple brick plinth and tile roof. The estimated cost is £1,250, exclusive of the conservatory.

DESIGN NO. 51—continued.

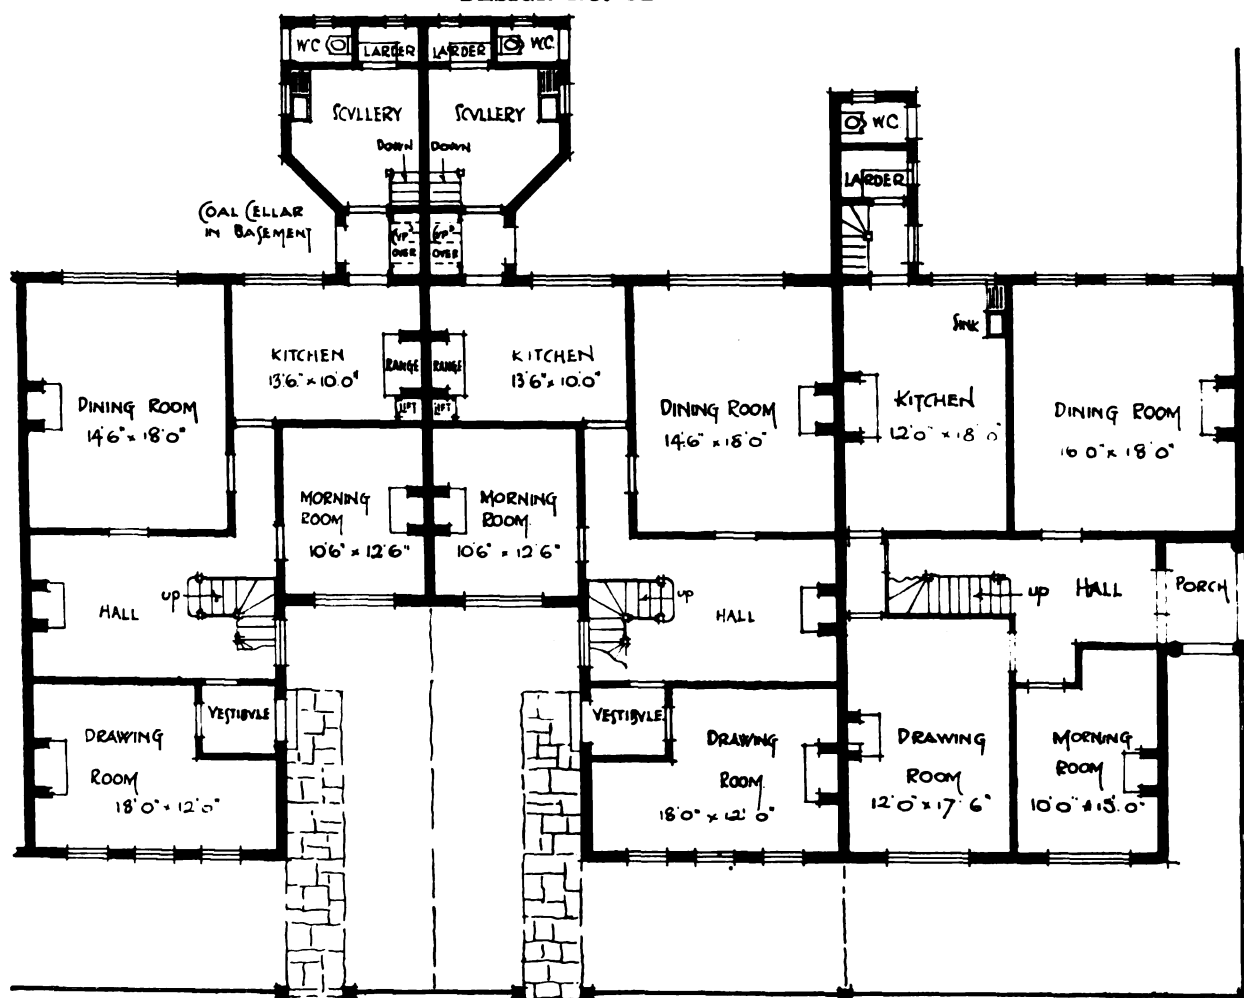

FIRST FLOOR PLAN.

DESIGN NO. 52.

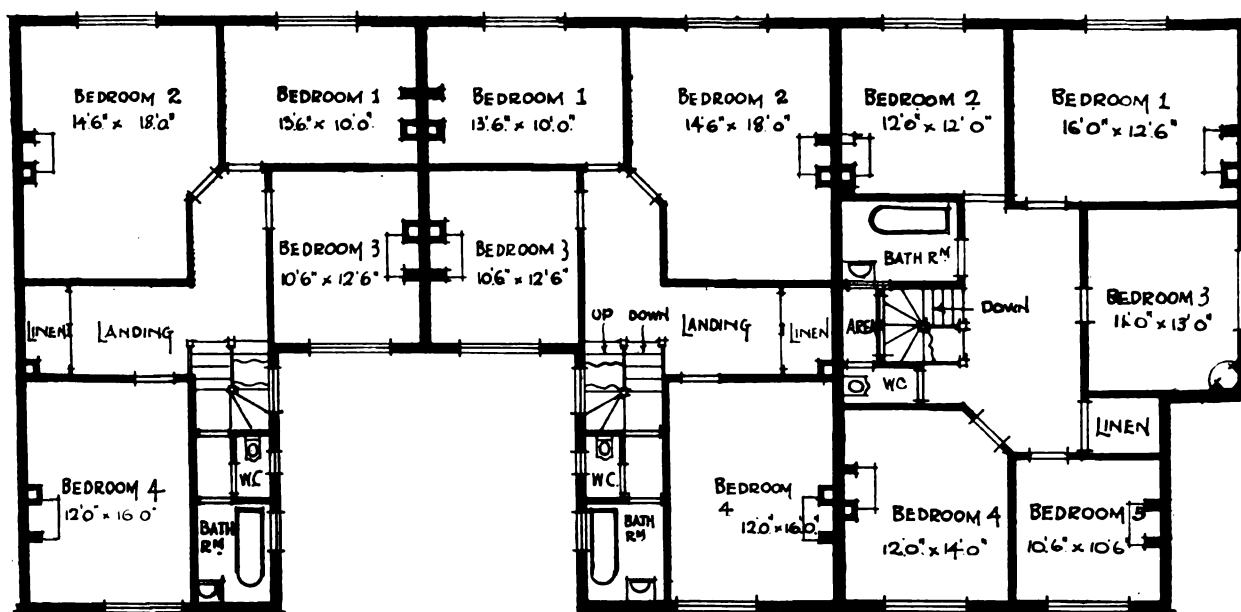

VIEW FROM CORNER OF TWO ROADS.

DESIGN NO. 52—continued.

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

Here we have a group of four houses, two of which at the ends, one only being shown on plans to save space, would be semi-detached. The group is arranged to suit a definite site, giving 30 feet frontage to each house, with a return road at one end and a free outlook at the other. As shown in the perspective view the roof at the rear is carried up to give two extra bedrooms to each house on the second floor, but these could be omitted if desired. The houses are designed for red brick walls on the ground floor with rough-cast above and tile roofs. The cost as sketched would be about £3,500 for the block, or £3,000 if the second-floor rooms were omitted.

DESIGN NO. 53.

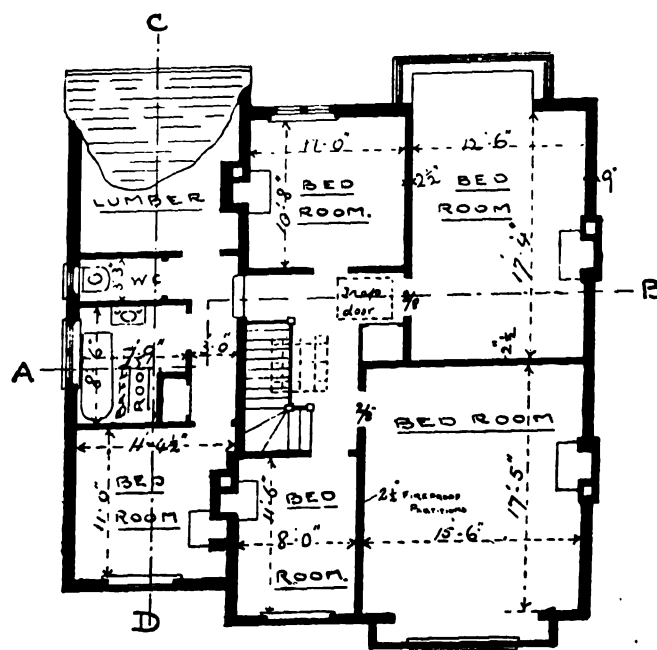

BACK ELEVATION.

FRONT ELEVATION

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

This is a normal type of house with well arranged accommodation, and could be carried out in red brick with Broseley tile roofs for about £1,050.

HOLLINWOOD, Lancs., and 78 King Street, MANCHESTER.

REGULATOR WITH COVER REMOVED.

The Contactless Compression-type Regulator

permits a perfect and absolutely gradual adjustment over a wide range of speeds.

It has no contact steps at which sparking may occur, and it is free from the many troubles experienced with Wire-wound Resistances, such as burnt-out coils and short circuits. The Resistance element is practically indestructible.

This house has been built and the view shows it as finished. The plans explain themselves, and the cost was about £950.

Special arrangements have been made to supply copies of the undermentioned work at the reduced price of 5s. 6d. net, including postage. Orders to be addressed to P. A. Gilbert Wood, 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

The Principles of Architectural Design

By **PERCY L. MARKS, Architect,**
Author of "The Principles of Planning Buildings" (3rd Edition 1911),

With 165 Full-plate and other Illustrations, Royal 8vo, 10s. 6d. net.

THIS work embodies not only a series of articles on Exterior Design, that appeared in the columns of THE ARCHITECT, but includes also a similarly detailed treatment on the principles affecting Interior Design.

There cannot be any dogmatism on the subject of Art; but there are certain underlying *principles*, and the object of this book is to propound these in an easy and argumentative manner on the lines so successfully pursued by the author in his now standard work on Planning.

The study of the principles referred to is aided by illustrations which are for the most part of a diagrammatic character; in which light they are to be regarded, and not as finished illustrations exemplifying the Perfect Design.

The book has been well received and sympathetically reviewed during the short period that it has been issued; and with a view to fostering the growing interest of the general public in the art of Design, it has been kept free from any undue use of technicalities. It should appeal, therefore, to the layman as well as to the architectural student and designer.

ORDER FORM.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

•• As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Oct. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARDIFF.—Aug. 6.—The Corporation invite designs and estimates in competition for a fire brigade station proposed to be erected in Westgate Street, Cardiff. The Corporation have appointed Mr. A. Marshall Mackenzie, architect, to act as assessor. The deposit of £2 2s. will be returned to all architects submitting bona-fide designs or who return the conditions within six weeks. Full particulars of the competition will be sent to the architects on application to Mr. J. L. Wheatley, Town Clerk, City Hall, Cardiff.

NORTON & GREGORY, LTD

Castle Lane. Westminster. S.W.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—The Corporation of the City of Glasgow invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

CONTRACTS OPEN.

ABERBEEG.—Aug. 6.—For alterations and additions to Aberbeeg station, Mon., for the Great Western Railway Co. Mr. A. E. Bolter, secretary, Paddington Station, London.

Deposit £2 2s. Mr. J. S. Vaughan, town clerk, Town Hall, Kingstown.

LAMBOURN (HUNGERFORD).—Aug. 6.—For erection of workmen's dwellings in the parish of Lambourn, for the Hungerford Rural District Council. Mr. W. S. Raine, A.M.I.C.E., Hungerford.

LANGHO (NEAR BLACKBURN).—Aug. 13.—For the erection of new workroom at the Inebriate Reformatory. Deposit £2. Mr. Henry Littler, 16 Ribblesdale Place, Preston.

LINTHWAITE.—Aug. 7.—For erection of four dwelling-houses in Cowlersley Lane, Linthwaite. Mr. Arthur Shaw, architect, Golcar.

LIVERPOOL.—Aug. 6.—For alterations and additions to a warehouse in Chaloner Street, Liverpool, for the Great Western Railway Company. Mr. A. E. Bolter, secretary, Paddington Station, London.

LLECHRYD.—For alterations and erecting new cloakroom at Llechryd Council School, for the Cardigan County Education Committee. Mr. G. Dickens-Lewis, county architect, Aberystwyth.

LOCK'S HEATH (HANTS).—Aug. 19.—For erection of an additional classroom for fifty children at Lock's Heath Council School, for the Hants County Council. Deposit £2 2s. Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

LONDON.—Aug. 13.—For foundations of new offices for the Public Trustee and Lunacy Commissioners, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. H. A. Collins, at H.M. Office of Works, &c., Storey's Gate, S.W.

LONDON.—Aug. 22.—For alteration and extension of boiler house at the workhouse, Swaffield Road, Wandsworth, for the Guardians. Deposit £2. Mr. F. W. Piper, clerk, Guardians' Offices, St. John's Hill, Wandsworth.

MERTHYR TYDFIL.—Aug. 12.—For erection of forty-eight workmen's dwellings on the Court Estate, near the Caemary-dwyn farm, for the Corporation. Deposit £2 2s. Mr. T. A. Rees, town clerk, Town Hall, Merthyr Tydfil.

OXFORD.—Aug. 6.—For erection of stables at Oxford, for the Great Western Railway Co. Mr. A. E. Bolter, secretary, Paddington Station, London.

PONTYPRIDD.—Sept. 2.—For erection of proposed new offices in Courthouse Street, Pontypridd, for the Guardians. Deposit £3 3s. Messrs. A. O. Evans, Williams & Evans, architects, Court Chambers, Pontypridd.

PORTRANE (CO. DUBLIN).—Aug. 8.—For erection of a new coastguard station at Portrane, Co. Dublin. Deposit £1. Mr. H. Williams, secretary.

RADCLIFFE.—Aug. 14.—For alterations and additions to Radcliffe technical school, for the Radcliffe Education Authority. Deposit £2. Mr. H. Littler, architect, 16 Ribblesdale Place, Preston.

ST. KEVERNE (CORNWALL).—Aug. 7.—For erection and completion of farm buildings at St. Keverne. Messrs. Granville & Hamilton, 53 Lemon Street, Truro.

ST. MARY BOURNE (HANTS).—Aug. 9.—For alterations to windows, ventilation, and lavatory accommodation at the St. Mary Bourne Council school, for Hants County Council. Deposit £1 1s. Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

SHEFFIELD.—Aug. 5.—For extension of the male sanatorium at the union hospital, Firvale, for the Guardians. Mr. G. D. Baxter, clerk of works, Firvale Workhouse.

SHEFFIELD.—Aug. 9.—For erection of fifty-five cottages on the Corporation estate at High Wincobank. The City Architect, Town Hall, Sheffield.

SILSDEN.—Aug. 9.—For the builder, joiner, slater, plumber, plasterer, painter, ironfounder, and smith and asphalter work at Silsden new school, for the West Riding Education Committee. The Education Architect, County Hall, Wakefield, and the Divisional Clerk's Office, Skipton. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

SMALL HEATH.—Aug. 6.—For erection of offices, &c., at Small Heath, near Birmingham, for the Great Western Railway Co. Mr. A. E. Bolter, secretary, Paddington Station, London.

SOUTHEND-ON-SEA.—Aug. 17.—For erection of a lodge and refreshment room at Southchurch Hall Park, Southend-on-Sea, for the Corporation. Deposit £1 1s. Mr. E. J. Elford, M.I.C.E., borough engineer and surveyor. Mr. H. J. Worwood, town clerk, Southend-on-Sea.

STAMFORD.—Aug. 8.—For erection of public swimming bath in the George Paddock, Stamford, for the Corporation. Deposit £1 1s. Mr. F. R. Rymen, A.M.I.C.E., Town Hall, Stamford. Sealed tenders to be sent to the Town Clerk.

TAVISTOCK.—Aug. 8.—For erection of a bungalow residence in Glanville Road, Tavistock. Mr. B. P. Shires, F.R.I.B.A., architect, 21 Lockyer Street, Plymouth.

THOMASTOWN (NEAR TONYREFAIL).—Aug. 12.—For erection and completion of 29 dwelling-houses at Thomastown, near Tonyrefail, for the Welsh Navigation Building Club. Mr. Philip J. Jones, architect, Church Street, Pontypridd.

TONLEY (ABERDEEN).—Aug. 8.—For the mason, carpenter, and slater work of a new barn wing of steading, West Haybogs, Tonley. Messrs. Hunter & Gordon, advocates, 80 Union Street, Aberdeen.

TREDEGAR.—Aug. 8.—For erection of a new chapel, adjoining Llys-Wedog Bridge, at Tredegar, Mon., for the trustees of the Poplar Road Congregational Church. Mr. A. F. Webb, M.S.A., architect and surveyor, Tredegar Chambers, Blackwood. Deposit £2 2s.

WEYBRIDGE.—Aug. 14.—The Commissioners of H.M. Works and Public Buildings are requiring tenders for the erection of Weybridge new head post office. Deposit £1 1s. H.M. Office of Works, Storey's Gate, S.W.

WOMBWELL.—Aug. 10.—For the construction of public baths at an estimated cost of £10,000. (Mr. Harold Burgess, architect, Queen Anne's Chambers, Broadway, Westminster, S.W.) Send application and £2 2s. deposit by August 10 to Mr. P. Milnes Walker, clerk to the Council, Town Hall, Wombwell.

THIRTEEN tenders were received for the reconstruction of the bridge over the River Hull, on the road from Beverley to Leven. This bridge, which is a brick one-arch structure, with a high gradient, has long been condemned as dangerous to the travelling public. The engineers responsible for its reconstruction were Sir John Wolfe Barry & Partners. The committee have accepted the tender of Messrs. Braithwaite & Kirk, of West Bromwich, to complete the work in seven months for the sum of £9,140 16s. This was confirmed by the Council. The Road Board will increase their contribution to the proposed bridge from £3,000 to £4,000.

AN attempt is being made to form the Insurance Society of the assistants and clerks of architects, surveyors, auctioneers, and land and estate agents, with a temporary office at 38 Parliament Street, Westminster, S.W., by a preliminary committee, with President and Treasurer. Principals are asked kindly to help in the formation of the Society. It is most probable that by October 15, when some Society must be joined, that this will be one of the most important and best in the country. There can be no doubt that the most sensible and advantageous way for the assistants and clerks of professional men to accept the position of insured persons under the Insurance Act is to form a Society to consist of themselves alone—to form a Society for each profession. There is so much difference between the assistant and clerk and his aims and objects in relation to his principal, and the so-called "working-man" who works by the hour and goes from place to place as a matter of course, that the possible variations in the methods and benefits of insurance available should be taken advantage of, and the most suitable result obtained. It is necessary that assistants and clerks should take every opportunity of making the Society known, and send in at once a letter, giving name and address of themselves and the employer, in order that a proper form of membership may be forwarded to them, so that the necessary number of members may be enrolled to constitute an "approved Society."

TENDERS.

BECCLES.

For the erection of new shops, &c., Smallgate Street, Beccles, for the Beccles Working-men's Co-operative Association, Ltd. Mr. ARTHUR PELLIS, F.S.I., architect, Beccles.

ROYAL SANITARY INSTITUTE.

THE twenty-seventh Congress of the Royal Sanitary Institute is being held at York from July 29 to August 3. A lengthy and instructive series of papers are to be read on subjects relating to domestic hygiene, engineering and architecture, and conferences of municipal representatives, engineers, surveyors, medical officers of health and sanitary inspectors will be held. Visits have been arranged to Earswick model village, Naburn locks, Doncaster model colliery villages, Gateforth Hall sanatorium, and to numerous public works; and as the number of delegates attending is one of the largest in the history of the Institute a very successful Congress may safely be predicted.

The delegates and members were received by the Lord Mayor of York on Monday last, followed by a luncheon in the ancient Guildhall, where he extended a cordial welcome to them. The Archbishop of York gave the inaugural address in the evening to a very large meeting, and reviewed the progress of the science of sanitation and hygiene, proving by statistics the improvements made during the past thirty years, as shown by the decreased death-rate and the improvement in the surroundings of the workers.

On Saturday, July 27, the Health Exhibition held in connection with the Congress was opened by H.R.H. Prince Arthur of Connaught, who showed by his speech and also by the interest he displayed in the various exhibits that he had more than a passing acquaintance with the objects for which the Exhibition had been organised.

The Exhibition, although not so representative as some of those held in previous years, contains much to interest the visitor in search of information in sanitary matters. The exhibits were carefully inspected and judged by a committee of civil engineers, architects and medical officers, under the chairmanship of W. C. Tyndale, Esq., M.I.C.E., and we give a list of the awards so far as they relate to subjects that are of interest to our readers.

On entering the Exhibition buildings the first stand to attract attention is that of "Ronuk," Ltd., who were given a bronze medal for their sanitary floor polish, which is now so generally used in schools, hospitals, and public buildings.

Sanitas Co., Ltd., were also awarded a bronze medal for their display of drain testers and disinfectants.

The Hygienic Construction and Portable Buildings, Ltd., were represented by a series of models to scale of Doecker buildings for sanatoria, which, apart from the excellence of the method of construction, are so designed as to give free circulation of air. With their lighter form of construction it is claimed that the building can be erected in eight hours, no special foundation being required. The Company received a silver medal.

The England Works have an interesting display of steel cloak-room, office and library fittings, for which they have previously received four medals from the Institute. The steel disinfecting chambers and wardrobes shown can be heated by steam or hot-water pipes. Sulphur drawers are fitted at the bottom, and ventilators to assist in starting the fumes and to dispel them through the chimney flue are provided. The automatic self-adjusting panic bolt is so designed that even small children, by the pressure of their bodies, unlock and open the doors. The "England" patent press knob for ordinary locks converts any latch into a press-latch. The "Sanatoria" fanlight opener is more particularly for use where blinds are fitted to windows having fanlights opening inwards. The quadrant is jointed, and falls perpendicular when the fanlight is shut. Below the gearing a projecting shoulder lifts the quadrant into position when the cord is pulled to open the fanlight and releases it by the reverse operation, when it falls into position with only 2 inches projection from the face of the sash. A bronze medal was awarded for these exhibits. Spencer Heath & George gained a silver medal for their display of educational and medical gymnastic apparatus.

Sanitaries, Ltd., the makers of Dr. Quine's sanitary dustbins, also show the bath basin, which title explains the object of the exhibit, for which they received a bronze medal.

William Harriman & Co., Ltd., show a variety of channel-bends, interceptors, gully traps, water waste-preventors, and closets. They received two bronze medals.

J. H. Walker & Co. made a good display of glazed stoneware sanitary pipes, bricks, terra cotta goods, chimney pots, &c., and had a bronze medal for their exhibit.

The British Sanitary Co. have a good variety of earth closets to show the different finishes to the cases, the mechanism being the same in their cheapest form, as well as in the more expensive. By their spreader, which throws the earth over the whole surface of the pan, these earth

closets are the most sanitary made. The British Sanitary Co. have already received eight silver medals from the Institute, and have received the same award at the present Congress.

Messrs. Carter & Co., Ltd., of Poole, show sample panels, tiles for walls, floors, hearths, &c., of the excellence expected from this firm.

The "Don" Fanlight Opener Co. have models of the "Don" fanlight opener, in which the quadrant lies parallel with the window when the fanlight is closed, and gained a bronze medal.

The Beacon Light (Valveless) Gas Generator, Ltd., have a working installation of their plant for lighting and heating. As we have recently favourably described this plant, it is only necessary to state that the silver medal they have gained confirms our good opinion.

Tuke & Bell, Ltd., show, in action, their method of sewage treatment with their "Ideal" revolving distributor. This exhibit has been selected by the judges for further practical trial. An installation suitable for country houses, consisting of ferro-concrete liquefaction tank with distributing tipper and tray for aerobic filter bed, is also exhibited.

Wm. Boby received a silver medal for his system of water-softening, and the Webb Lamp Co., Ltd., a similar award for their sewer ventilating lamp.

Messrs. Thomas Parsons & Sons again receive the recognition from the Institute of the good qualities of their manufactures by being awarded a bronze medal, the highest award in their class.

"Endelline," "Endelflat," and "Lacreite" sanitary enamel paints are employed in the decoration of their attractive stand, a "Transol" frieze surmounting the whole. The transfer to the walls was effected after the stand was erected, showing its superiority over stenciling, both for effect and saving of time. "Opako," a material employed as an under-coat for enamel, &c., free from white lead, as well as varnishes and stains, are also exhibited.

The Improved Sanitary Appliances Co. have a very interesting exhibit of sanitary appliances. The patent adjustable cantilever water closet, in which the junction branch piece, trap and socket are in one piece, the soil having, therefore, to pass one joint only, can be set at any angle on plan to suit position of the outside soil pipe. The soil is conveyed in a straight line from the pan to soil pipe. It is entirely carried by the wall on the bearing plate, and thus stands clear of the floor, enabling it to be kept thoroughly clean. A bronze medal was awarded.

The Patent Cantilever Sink Traps comprise a bracket, trap, inspection arm, and head in one casting, forming a cantilever, and the building of it into the wall fixes all four at once. This appliance gained the Institute's medal at the Brighton Congress in 1910. The "Conqueror" combination, by which the washing copper becomes the bath water heater, is now well known, and was also awarded a bronze medal at the Brighton Congress. It holds fourteen gallons, and gives a supply of hot and cold water to the bath and to the sink, the hot water being forced to the upstairs bath or to the sink solely by the influx of cold water, and thereby ensures a continuous supply.

J. H. Shanksmith had a good display of bathroom fittings, lavatories, &c. The Walker health pipe was also shown, for which he was awarded a bronze medal.

Jones & Attwood, Ltd., gained a silver medal for their exhibit of working models of patent sewage wheel distributors and rotary distributors for circular filters, also a bronze medal for their "Bathheater" boiler and circulating cylinder combined, designed for fixing in kitchen or scullery.

The Model Abattoir Society were awarded a silver medal for their models of public abattoirs designed by Mr. R. S. Ayling, architect.

Cloughton Bros., Ltd., as usual, have a comprehensive display of sanitary lead work, and received a bronze medal for "Niagara" lead line syphon cistern, and also a bronze medal for their "Adaptable Suspension" wash-down closet.

Kirtley & Son, Ltd., gained a bronze medal for their earth closet hatch, and another for the "Mowbray" tipping ash bin.

The Cobra Drain and Pipe Cleanser, Ltd., received a bronze medal for their drain cleaning apparatus, which withdraws stoppages from sanitary pipes without opening them up.

Moule's Patent Earth Closet Co., Ltd., were again awarded a bronze medal for their earth closets, of which they showed various patterns.

Chaddock Ventilation Co., Ltd., gained a silver medal for their automatic window ventilators, which are constructed to enable the operator to regulate the direction of the air movement.

The Limmer Asphalte Paving Co., Ltd., showed specimens of raw mineral rock asphalt, also reduced to powder, "Lithofalt" asphalt paving blocks, vertical damp courses, and roofing, for which latter they received a bronze medal.

In the Gallery the City of York had an excellent display of electric fittings, cooking ranges, radiators, ventilating fans and ozone generators, &c., and working demonstrations were given of the use of the British Vacuum Cleaners electrically worked. The York United Gas Light Co. showed gas heated boilers, gas fires, gas cookers, radiators, &c., manufactured by Fletcher Russell & Co., Wilsons & Mathiesons, and John Wright & Co. There is also an excellent loan exhibition of models, charts and diagrams relating to matters of public health and sanitation.

THE BRITISH FIRE PREVENTION COMMITTEE'S SUMMER MEETING.

THE British Fire Prevention Committee's proceedings on the second day of their summer meeting (of July 24 and 25) were attended by practically the same members and visitors as those of the first day, the testing operations, however, being in the hands of Mr. Ellis Marsland (district surveyor) and Mr. Bertram Chatterton, A.M.Inst.C.E. (insurance surveyor), and among those who had not been present on the previous day were Lieutenant Sladen, R.N., and Mr. Gamble, F.S.I., of the London Fire Brigade. The Earl of Londesborough, K.C.V.O., supported by other members of the Council, again received the visitors, and among the authorities represented were the Home Office, Admiralty, Board of Trade, London County Council, &c.

The fire tests were with three sets of electro-glazing case-ments of the Luxfer type, followed by a test with a double door constructed of reinforced concrete, this latter hailing from Belgium, where it had been constructed to the specifications of the Chairman of the Belgian Government Fire Committee, and had been sent over for report.

The arrangement of holding tests on two consecutive days was considered a great success, inasmuch as it made it more convenient for members and representatives of authorities in the provinces specially visiting London, and it is to be anticipated that this arrangement will be followed in future years.

Results of Tests.—Some of the official "short results" of the testing operations at the British Fire Prevention Committee's testing station on July 24 and 25 have now been authorised for issue. They may be summarised as follows:—

The 22 feet by 15 feet reinforced concrete floor with "triangle mesh" reinforcement, and submitted by the United States Steel Products Co., of London, obtained classification as affording "full protection" (Class B) on a four hours' fire test at temperatures ranging up to and above 1,800° F., followed by the application of water from a steam fire engine (through two branches) for five minutes, the floor being under a load of 2½ cwt. per foot super during the test. This is the first floor having this method of reinforcement subjected to official fire test in England and to attain this high classification.

The double reinforced concrete doors submitted for test by the Chairman of the Belgian Government Fire Committee obtained the classification of affording "full protection" (Class A) on a 2½ hours' fire test at temperatures ranging up to and above 1,800° F., followed by the application of water from a steam fire engine (through one branch) for five minutes.

The "Chadrac" electro-glazing to windows, submitted for fire test by Messrs. Joseph Chater & Sons, in panels of 2 feet by 2 feet, and similarly in a panel of 4 feet by 2 feet, obtained the classification of affording "temporary protection" (Class B) on a one hour fire test at temperatures up to and above 1,500° F., followed by the application of water from a steam fire engine (through one branch) for two minutes. This is the first occasion of so large a panel of electro-glazing of 8 feet super having attained this classification.

The results obtained in the remaining fire tests with "Chadrac" electro-glazing and "Luxfer" electro-glazing will be announced later.

Further Tests.—The committee announce that the reinforced concrete floor referred to above will be submitted to an additional load test over and above the committee's standard requirements by the application of a heavier load after the subsequent cooling of the floor, and that among the next tests will be a series with a non-flaming celluloid known as "Cellit," the first product of this character to be submitted to the committee's official tests.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

BUCKINGHAMSHIRE.

Amersham.—Isolation Hospital.

Wymondley.—Public abattoir.

CHESHIRE.

Congleton.—St. James', St. Peter's, and St. Stephen's C.E. Schools: alterations.

Macclesfield.—Country Nursing Home for the Cripple Children's Help Society.

CUMBERLAND.

Carlisle.—Council School, Caretaker's Cottage, &c., off Newtown Road.

DERBYSHIRE.

Bugsworth and Chinley (between).—Council School for 250 scholars.

Dronfield.—Picture Palace. Mr. J. S. Elshaw, architect.

Ripley.—Seven houses, Heath Road, for Mr. A. Gent.

Two houses, Wellington Street, for Mr. E. Tansley.

DEVON.

Crownhill.—Farm buildings, Whiteleigh Hall: additions and alterations. Messrs. Carder & Carder (of Plymouth), architects.

Egg Buckland.—Council School: alterations.

Tavistock.—Cookery Centre and Art rooms.

Whitestone.—Two dairy-houses, farm buildings, and additions and alterations, Way Farm. Messrs. Ellis, Son & Bowden, F.S.I. (of Exeter), architects.

DORSET.

Portland.—Council (Underhill) School.

DURHAM.

Bishop Auckland.—Wesleyan Church, South Road (£12,000).

Gateshead.—Lunatic Asylum. Messrs. G. T. Hine & H. C. Pegg, F.F.R.I.B.A. (of London), architects.

Sunderland.—Infectious Diseases Hospital: extensions (£6,000).

Workhouse, Hylton Road: additions and alterations. Messrs. W. & T. R. Milburn, F.F.R.I.B.A., architects.

ESSEX.

Billerica.—Workmen's dwellings, Great Burstead (£11,100).

Canewdon.—Endowed School: alterations. Mr. F. Whitmore, County architect, Chelmsford.

Chelmsford.—Fire Engine Station, Market Road: extension. Borough Engineer.

Central Sanatorium for consumption.

Grays.—School, Arthur Street: additions and alterations. Messrs. H. J. Carter, Ltd., contractors (£2,175).

Ingrave and East Horndon.—Council School.

Pembroke.—Electricity Works: extension of buildings, South Lotts Road.

Shangarry (Co. Carlow).—Medical Officer's residence and Dispensary, for the Board of Guardians. Engineer to the Guardians, Carlow.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Root, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 13,693. June 8, 1911.—Improvements in flushing valves. T. W. Twyford, Cliffe Vale Potteries, and Enamelled Fireclay Works, Hanley, Staffs. This invention relates to flushing valves or appliances employed in connection with water closets, urinals, and the like, for the purpose of giving a direct flush without the use of a flushing cistern. The object is to provide a more efficient construction, and also a flat or bucket device which will ensure a definite period between successive flushes, and thus give an intermittent action. Fig. 1 represents a section through the flushing appliance. A cylindrical chamber, 1, contains the rising and falling main valve, 2, which normally rests upon a seating, 3, at the upper end of an outlet passage, 4, leading to the discharge or flush pipe, and forming, with the walls of the lower part of the top chamber, 1, an annular space, 5, which at one side opens into a branch pipe, 6, connected to the main supply, and carrying the attachment bracket, 7, of the appliance. The valve, 2, overhangs the seating, 3, so that when closed the pressure of the water acts on the underside of its outer edge and tends to lift it off its seating. Leading from the inlet branch, 6, into the upper part of the top chamber is a small passage, or by-pass, 8, through which the chamber is filled with water, the pressure of which normally keeps the main valve upon its seating. The by-pass has a regulating valve, 9, so as to vary the quantity of water

that passes, and thus the time the chamber takes to fill and the period of the flush. Within the pressure chamber, 1, is a plunger, 10, consisting of an inverted leather cup washer, and clamped between upper and lower plates, 11, 12, screwed on to a central stem, 13. The lower member, 12, is provided upon its underside with a cylindrical housing, 14, within which a piston extension or reduced portion, 15, of the main valve, 2, has a close sliding fit. This chamber, 14, communicates with the main pressure chamber, 1, by means

of a passage, 16, through the stem, 13, the passage being adjustable, as regards its effective size, by means of a screw valve, 17, so as to vary the rate at which the water can enter the valve chamber. The plunger is acted upon by a spring, 18, which tends to return the main valve on to its seating. The stem, 13, is prolonged into a depending rod, 19, passing through the main valve, and adapted to be operated by a lever arm, 20, mounted upon a horizontal spindle, 21, upon which an external lever handle is fixed. June 26, 1912.

PATENT SPECIFICATIONS PUBLISHED JULY 25, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 15,093. June 28, 1911.—J. S. Owens, 47 Victoria Street, Westminster, S.W. Metallic sheet piling.

15,202. June 29, 1911.—F. W. Robertshaw, 617 Braddock Avenue, Pittsburgh, U.S. Water heaters.

15,227. June 29, 1911.—L. Petersen-Hviid, Kastrup, near Copenhagen. A process for removing the volatile constituents contained in certain woods so as to render them capable of taking a high and durable polish.

15,581. July 4, 1911.—Carl Karges, 36 Bramscherstr., Osnabruck, Germany. Locking device for door latches.

15,831. July 7, 1911.—H. C. Lassam, The Hut, Walton-on-Thames, and T. M. Thom, Woodlands, Cheshunt, Herts. Glazing bars and the like.

16,225. July 13, 1911.—D. E. Brown and C. A. Vandervell, Warple Way, Acton Vale. Lamp reflectors.

19,684. Sept. 4, 1911.—Date claimed under International Convention Sept. 3, 1910. C. V. Biedinfeld & Co., G.m.b.H., 12 Maasenstr., Berlin. Indicating mechanism for height and length measuring device and the like.

20,038. Sept. 9, 1911.—A. R. Taylor, 23 Rosendale Road, Dulwich, S.E. Steam roller speed indicator.

21,034. Sept. 23, 1911.—Stephen Strettles, 12 Willows Crescent, Birmingham. Sand moulding machines.

22,678. Oct. 14, 1911.—William Taylor, 69 Shepstone Road, Horbury, near Wakefield. Hinged gates and doors.

24,229. Nov. 1, 1911.—Carl Hotz, 48 Doneraile Street, Fulham. Apparatus for preventing the deposit of moisture on windows and other glass surfaces and other analogous purposes.

24,468. Nov. 3, 1911.—E. & F. W. Edlin, 20 Cavendish Road, Leicester. Moulds for use in the manufacture of paving slabs and the like.

15,536. July 4, 1911.—William Smith, Fair View, Lower Gornal, near Dudley. Die for making perforated bricks.

25,264. Nov. 13, 1911.—Date claimed under International Convention Nov. 14, 1910. Otto Mengers, 32 Regensburgerstr.; Karl Lange, 46 Wilhelmstr.; and Georg Lentschat, 11 Hundekehlenstr., Schmargendorf, Berlin. Gas heating and lighting apparatus.

25,515. Nov. 16, 1911.—Thos. C. Fawcett, Ltd., and J. D. Fawcett, Whitehouse Engineering Works, Hunslet Road, Leeds. Brick making machines having rotary feeders.

25,945. Nov. 21, 1911.—J. W. Phillips, 127 Millbrook Road, Southampton. Casement windows, doors, and the like.

26,757. Nov. 29, 1911.—Date claimed under International Convention Nov. 30, 1910. S. J. Larsson, 10 St. Eriksgatan, Stockholm. Stone saws.

29,393. Dec. 30, 1911.—Date claimed under International Convention Jan. 5, 1911. August Butner, Verdingen-on-the-Rhine. Joints of heat radiators and the like.

899. Jan. 11, 1912.—J. A. Schlehr, 36 W. Randolph Street, and Louisa Consoe, 1511 Park Street, Chicago, U.S. Bolt holders, pipe wrenches, and the like.

1,553. Jan. 19, 1912.—Simon Biheller, 70 Chiswell Street, London. Globe rings or holders for supporting globes for gas and other lamps.

2,147. Jan. 26, 1912.—Simon Biheller, 70 Chiswell Street, London. Fittings for supporting a lamp shade and globe.

2,762. Feb. 2, 1912.—W. J. Swain, architect, Bell Vue House, 118 Hasby Road, York. Reinforced floors and beams of concrete or any other fireproof or fire-resisting material.

3,518. Feb. 12, 1912.—Albert Lochert, 2 Pannierstr., Neukolln, Germany, and the Florozon-Gesell. mit Beschränkter Haftung, 101 Lindenstr., Berlin, S.W., 68. Door and like springs.

3,629. Feb. 13, 1912.—M. H. Tulloch, C.B., R.E., 33 Half Moon Lane, Herne Hill. Means for controlling the flow of liquids through pipes, sewers, and other channels.

5,983. March 9, 1912.—Deutsche Filtercompagnie G.m.b.H., and Valerius Kobelt, 3 Haberlandstr., Berlin, W., 30. Filters.

6,034. March 11, 1912.—Date claimed under International Convention March 10, 1911. Firm Kaliwerke Aschersleben Abteilung Tekton, of Aschersleben, Germany. Flooring.

6,561. March 16, 1912.—William Bell, Fortfield, Dunmurry, Belfast. Hinges and means for retaining them in more than one position.

10,602. May 4, 1912.—Date claimed under International Convention May 18, 1911. Firm of Gebr. Friesecke, Artificial Stone Works, 94 Plan-Ufer, Berlin, 8. Improved shaking machine for use in the manufacture of concrete or artificial stone.

11,239. May 11, 1912.—Date claimed under International Convention May 18, 1911. Edward Friedrich, 25b Carl Heinestr., Leipzig-Plagwitz, Germany. Breaking or crushing apparatus.

13,596. June 10, 1912.—Date claimed under International Convention June 23, 1911. Gustaf Dalen, 18 Stadsgården, Stockholm. Storing of acetylene gas.

INCORPORATED CHURCH BUILDING SOCIETY.

THIS Society held its usual monthly meeting on Thursday, July 18, at the Society's house, 7 Dean's Yard, Westminster Abbey, S.W.

Grants of money were made in aid of the following objects—namely: Building first portions of new churches at Aldersbrook, St. Gabriel, Essex, £50; Chalfont St. Peter, All Saints', Bucks, £90; Sandycroft, St. Ambrose, Hawarden, Flint, £75; and Siddal, St. Mark, Halifax, £75; and towards enlarging or otherwise improving the accommodation in the churches at Bedminster, St. Aldhelm, Bristol, £35; Dearnley, St. Andrew, near Rochdale, £50; Groombridge, St. John, Kent, £25; Little Steeping, St. Andrew, Lincs., £40; South Norwood, St. Alban, Surrey, £70; Orlingbury, St. Mary-the-Virgin, Northants, £10; Swansea, Christ Church, Glam., £100; Withycombe, St. Nicholas, Somerset, £60; and Woolacombe, St. Sabinus, Devon, £80. Grants were also made from the Special Mission Buildings Fund towards building Mission churches at Stanley Common, All Saints', Derby, £40; Swansea, St. Martin, Glam., £30; and Westcliff-on-Sea, St. Michael and All Angels, Essex, £50. The following

grants were also paid for works completed:—Bishopwearmouth, St. Gabriel, Sunderland, £250; West Streatham, St. James, Surrey, £175; Woolacombe, St. Sabinus, Devon, £100; Branscombe, St. Winifred, Devon, £50; Speenhamland, St. Mary, Berks., £150; Gyfeillon, St. David, Glam., £30; Loughborough, St. Peter, Leicestershire, £125; Plymouth, St. Mary, £140; Kingston Hill, St. Paul, Surrey, £50; Southend-on-Sea, St. John the Baptist, £50; Hoole, All Saints', Cheshire, £60; Somersham, St. John the Baptist, Hunts., £5; Abercrave, St. David, Breconshire, £100; Frimley Green, St. Andrew, Surrey, £50; Rotherhithe, Clare College Mission, Kent, £35; and Bispham, St. Stephen, Lancs., £40. In addition to this, the sum of £810 was paid towards the repairs of fourteen churches from Trust Funds held by the Society. The committee once more ask for a prompt and generous response to its urgent appeal for contributions to its work of church extension and repair. The population of the country is increasing by more than 400,000 every year, and the need for church building is a proportionately increasing one. The Society has no endowments, and is absolutely dependent upon voluntary offerings. Among contributions recently received have been cheques for £1,000, £200, and £25 respectively.

LONDON MASTER BUILDERS' ASSOCIATION.

THE Council of the London Master Builders' Association met on July 18, the chair being occupied by Mr. James S. Holliday, president. The special committee appointed to confer with the representatives of the various trade organisations submitted its reports of the several conferences which had been held which were unanimously adopted. The recommendation of the Law and Parliamentary Committee in respect to important legal cases affecting members of the association was approved and adopted. The following firms were nominated for associate membership:—Messrs. C. Burley, Ltd., Sittingbourne; Messrs. Samuel South & Son, Edmonton.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

CANDIDATES who propose applying for admission to the November Final and Special examination should at once submit for the approval of the Board of Architectural Education the subject and titles of their theses. Candidates may select one of the following:—

1. *Historical Architecture*, implying, as far as possible, the direct study of actual historical buildings.
2. *Science, as applied to Building*. By this is intended a special study of an application of science to definite problems of building.
3. *Design, including Decoration*, such as a study in civic monumental, decorative, or other branch of architectural design.

The subject selected for the thesis is to be notified for the approval of the Board four months before the date of the examination, and the thesis itself is to be submitted four weeks before the same date. The thesis, which may be either an illustrated essay or a design with a detailed report, will be assessed by examiners specially appointed for the purpose, who will also examine the candidate orally in his thesis. It is open to candidates to obtain distinction in the advanced work, such special distinction to appear in the Kalendar.

VARIETIES.

IN the historic neighbourhood of Hambleden, Bucks, a Roman villa has been discovered, and the process of excavation is being carried out with success.

PLANS for the enlargement of St. Luke's Chapel-of-Ease, Stoke Bardolph, Notts, are being prepared by Mr. R. Whitbread, M.S.A.

THE Hemsworth Board of Guardians have accepted the plans of Mr. Richardson for a proposed workhouse, subject to the approval of the Local Government Board. It was decided to proceed at once with the erection of the aged men's block, the isolation block, and the mortuary.

IT is proposed to have a public architectural competition for a library to be erected in Langside ward, Glasgow. The estimated cost of the building is £5,500. It is recommended that a site at the corner of Sinclair Drive and Battlefield Road be utilised for the purpose.

IN connection with the Spalding housing scheme promoted by the Urban District Council, Mr. J. B. Corby, F.S.I., of Stamford and Spalding, has been selected from three local architects to prepare the plans. Instructions have been given to have the plans prepared forthwith for submission to the

Local Government Board, and as soon as the proper authority is obtained the work will be commenced.

THE recommendation of the Sanitary Committee that the Devonport Council adopt the Baths and Washhouses Act, that the terms of Lord St. Levan for a new lease of the bathing-place at Mount Wise be accepted, that the tender of Mr. E. R. Lester (£879) for the swimming bath be accepted, and that application be made to the Local Government Board for sanction to the borrowing of £1,200 has been adopted.

UNDER the will of the late Sir James Inglis, a former President of the Institution of Civil Engineers, the Institution has just received a legacy of £5,000, to be applied to its new building, which is now in course of erection in Great George Street, Westminster. This legacy testifies to the marked interest which Sir James Inglis took in the scheme for the rebuilding of the Institution, towards the cost of which he had also during his lifetime contributed liberally, regarding the occasion as an opportunity to promote the centralisation, and thereby the strength, of civil engineering interests throughout the British Empire.

THE succession of Mr. Walter Knight Shirley, Licentiate R.I.B.A., to the Ferrers Earldom, as eleventh earl, has, says the *Yorkshire Post*, not a parallel since, on the death of the late Duke of Hamilton without male issue, the dukedom passed to a very distant kinsman, a naval lieutenant, by virtue of his descent from the third son of the celebrated fourth Duke, who was slain in a duel with Lord Mohun at Hyde Park in 1712. Mr. Shirley has succeeded his distant kinsman through his descent from the first Earl Ferrers, who died in 1717. That nobleman, who was predeceased by his eldest son, was followed in the earldom by his second and third sons. Earl Ferrers' fourth son was the father of the fourth, fifth, and sixth earls, the fourth being the nobleman who was hanged at Tyburn for murder. Mr. Shirley is lineally descended from a younger branch of these three earls, the links in the chain being the Rev. Walter Shirley, the hymn writer; Walter Shirley, Bishop of Sodor and Man; and the late Canon Shirley, Regius Professor of Ecclesiastical History at Oxford, who died when his son, now the eleventh Earl Ferrers, was an infant.

FOR the many thousands of holiday makers who will take advantage of the August Bank Holiday for a desirable change, the Great Central Railway have just published a varied choice of excursion facilities to all parts of their system. A perusal of their special A.B.C. programme reveals the extensiveness of the arrangements offered to over 300 holiday resorts and towns in the Midlands, Yorkshire, Lancashire and the North of England. Special trains will leave Marylebone at convenient times on Friday, Saturday, Sunday and Monday, August 2, 3, 4, 5, and these express trains are equipped with restaurant cars, enabling passengers to obtain refreshments at the most moderate tariff. For those who wish to spend a pleasant day or week-end nearer home suitable excursions are arranged to many picturesque and historical places in Middlesex, Herts, and Beechy Bucks. This tract of delightful country, with its old-world villages, breezy heights, and peaceful vales, is admirably suited for walking and cycling, and special cheap fares are in operation for both the walker and the cyclist. Copies of this special holiday programme may be obtained free at Marylebone Station, G.C.R. Agencies, or by post from Publicity Department, 216 Marylebone Road, N.W.

TRADE NOTES.

MESSRS. W. F. STANLEY & Co., LTD., the well-known instrument makers, have opened a branch at 68 Queen Street, Glasgow, and are prepared to supply the needs of Scots draughtsmen.

MESSRS. J. H. SANKEY & SON, LTD., Essex Wharf, Caning Town, E., have put on the market a new heavy patent brass sink or bath waste, with a special removable strainer bucket. It is claimed for it that it is strong, sanitary and cheap. The firm are famous for their stock of sanitary pipes and fittings, and it may be safely said that their new improvement is a "good thing."

ST. OSWALD'S CHURCH, Lower Peover, Cheshire, possesses a ring of six bells, tenor 9 cwt., and it has now been decided to have them recast and rehung in a steel frame as a memorial to the late Rev. Arthur Guest, who was vicar from 1877 to 1911. The bells are to be recast into a new ring of six, with a 12-cwt. tenor, and the work is to be carried out by Messrs. John Warner & Sons, of the Spitalfields Foundry, London.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BECKENHAM.—Aug. 12.—The Education Committee invite designs in competition for proposed public elementary school. Send application by August 12 to the assessor, Mr. A. W. S. Cross, F.R.I.B.A., 46 New Bond Street, London, W.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects,

together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelly.

WILLINGTON QUAY.—For erection of new infant school at Willington Quay-on-Tyne. Send names to Mr. P. L. Browne, architect, Pearl Buildings, Northumberland Street, Newcastle.

THE Hull Picture Selection Committee have purchased out of the Ferens Fund the painting "Farewell," by Lord Leighton, P.R.A., for £1,250.

THE completed plan for the new Co-partnership and Suburb Trust extensions at Hampstead shows an area of 412 acres, on which 3,208 houses are to be erected, providing for a population of between 15,000 and 20,000. Sixty acres will be devoted to open spaces and wooded lands, and one of the recreation grounds will cover 20 acres. Two-thirds of the new area will be developed by the Co-partnership Tenants' Society, and an innovation will be the provision of a market square, in which it is proposed the tenants shall sell their garden produce.

WELLINGBOROUGH.

For alterations and extensions at the Park Street Council school, for the Northants Education Committee. BROWN & SON, Wellingborough (accepted) £4,713 18 5

THE Surrey County Council are about to carry out at Brookwood Asylum the centralisation under one roof of the work now carried on at the boiler houses and electric light station with a view to saving the cost of working expenses. Messrs. Handcock & Dykes, the engineers, have estimated the inclusive cost involved at £6,500, and the resultant saving at £1,188 per annum.

THE Leeds City Council last week by a large majority approved a big street improvement scheme proposed in connection with the extension of the Infirmary, towards which a fund of £150,000 is now being raised. The Council will spend £85,000 on the acquisition of slum property near the Infirmary, and construct a new street 60 feet wide.

THE Gorseinon Co-partnership Housing Society last week sent up a deputation to the Public Works Loans Commissioners to ask for a loan of £45,000 for the purpose of erecting about 300 houses for the working classes on Garden City lines at Gorseinon, where overcrowding has several times been the subject of questions in Parliament. Mr. Beddoe Rees, architect, formed one of the deputation.

COMPETITION NEWS.

BECKENHAM.—The Education Committee are about to organise a competition for a proposed elementary school among architects who have had considerable experience in this class of work. Intending competitors should send in their names by Monday, August 12, to the assessor, Mr. A. W. S. Cross, F.R.I.B.A., 46 New Bond Street, W.

BULGARIA.—With reference to the notice in "Competitions Open," relative to a competition of designs for (1) a new Royal Palace and (2) new Law Courts at Sofia, H.M. Legation at that city have now forwarded a copy of a revised programme which takes the place of that first issued. Architects must submit their designs by December 1 to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the revised programme (in French), together with drawings, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street.

BURMA.—In our issue of June 28 we announced that the Municipality of Rangoon (Burma) invited architects to enter into a competition for the designing and supervising of the erection of a new municipal building. Honorariums of £300, £200, and £100 are offered. In addition to the particulars then given we now understand that plans of the site may be obtained on payment of £1 deposit from Messrs. Ogilvy, Gillanders & Co., Sun Court, 67 Cornhill, E.C.

CANADA.—With reference to the notice in "Competitions Open" relative to a competition of designs for a monument to be erected at Ottawa to his late Majesty King Edward VII., at a cost not exceeding 35,000 dols. (about £7,200), H.M. Trade Commissioner for Canada now reports that the date of the receipt of designs has been extended to November 1. Designs in the form of sketch models in plaster on a scale of $1\frac{1}{2}$ in. to the foot should be sent to Mr. Eric Brown, Director of the National Art Gallery, Ottawa, Canada. The design may take the form of a portrait, statue, or a symbolic memorial, and will be judged by the Advisory Arts Council for the Government of the Dominion of Canada. Communications regarding the competition should be addressed to the Secretary, Public Works Department, Ottawa.

CHELTONHAM.—The Town Council considered on Friday last, the 2nd inst., the report of the Municipal Offices Sites Committee. The Mayor explained that eight designs had been sent in from local architects, and that the committee were evenly divided on two. As, however, no one of the designs sent in could be carried out for the sum stipulated (£11,000) they were unable to award the premium. The committee recommended that they be authorised to consult with the architects sending in the two best plans, "with a view to consider whether modifications can be made." A member proposed that the President of the British Institute of Architects be requested to appoint an architect to report on the two plans referred to. This was seconded. After a long discussion, however, in the course of which opposition was expressed to the proposed site on the Winter Garden, a further amendment for referring the matter of the plans back to the committee was carried.

HARTLEPOOL.—The Town Council on Wednesday last decided to advertise for plans for the erection of a school at Throston, to replace existing buildings.

TOWN PLANNING AROUND DONCASTER.

DR. DUNNE, the medical officer for the Doncaster rural district, points out that the development of the South Yorkshire coalfield is affecting Carcroft, Edlington, and Askern, where active building operations are in progress. The modern colliery, as established here, may be assumed to take from three to five years in sinking, and when fully developed will employ 3,000 men and boys, forming the centre of a mining community of from 12,000 to 15,000 persons. The next two or three years, the doctor says, are critical ones in the development of the district. At present, owing to the rural character of the places where these collieries are being sunk, it is possible, with the powers that Parliament has placed in the hands of the local authority under the Housing and Town Planning Act, 1909, to lay down the broad lines on which each place shall develop. It is necessary to look ahead some ten or twenty years. The mining population is coming almost entirely from Nottinghamshire and Derbyshire, as the new collieries are largely being developed by colliery proprietors from those counties. Coal mining is destined to employ about 20,000 to 25,000 colliers by the next census.

large and comprehensive lines, to be initiated in the district where so many local authorities are concerned, yet within the administrative area of the Doncaster rural district there are several districts where less ambitious, but equally useful, schemes of town planning can engage attention. Doncaster, with the mining townships which are springing up all around at a distance of from five to seven miles, presents unlimited scope for the energies of the town planner. There will be large mining communities of from 10,000 to 15,000 people at any of the following places by the next census: Askern on the north, Carcroft, Adwick-le-Street, Edlington, and Warmsworth on the west, Rossington on the south, and in all probability Armthorpe and Barnby Don on the east. Perhaps the best time for initiating a town plan has gone by for Askern and Carcroft, and the same is probably true of Edlington; but the "door of opportunity," spoken of by the Archbishop of York, is still ajar. Rossington, Armthorpe, and Barnby Don present areas where a town plan might be considered with advantage to future generations. The doctor points out that if a town plan had been adopted at Carcroft, embracing an area lying in a circle with a radius of a mile or a mile and a half from the pit shaft, the development which is taking place in that neighbourhood would have been on orderly lines, instead of the present unsystematic method.

Reference is then made to what is contemplated and what is actually being done in several places. At Edlington 823 houses will eventually be built, sites for recreation grounds and for places of worship having been reserved, whilst at Askern, a colliery village, covering some fifty-five acres, the erection of 1,000 houses is in contemplation. All these houses will be wanted by 1916, as it is anticipated that coal will be reached by next March. A colliery village on a small scale is in contemplation at Owston, where the Balcroft Colliery Company have acquired land, and at Rossington the colliery company intend erecting a model village of 1,000 houses. The doctor speaks of the Woodlands model village as one of the healthiest communities in the district. The average number of houses per acre is eight, but in the Park district there are only five to the acre. Last year at the Woodlands village there were only two deaths from enteritis and one notification of enteric fever, and this originated outside the district.

THE Birmingham City Council are making arrangements for the lease to a syndicate of the Aston Reservoir property for a term of thirty-six years at an annual rent of £1,500, subject to a rebate during building. The syndicate propose to convert the reservoir into a sort of White City.

MESSRS. BRIGGS, WOLSTENHOLME & THORNLEY, architects, have been instructed to submit an amended scheme for the proposed Town Hall at Wallasey. Their original competition scheme was estimated to cost £123,000; this amount was subsequently reduced to £110,700 and again to £102,000. The Town Council now desire that a further reduction of 15 per cent. shall be obtained.

A PROPOSAL is on foot to establish a public auction mart in the West End of London, and a suitable building in an excellent position has been found available for the purpose at the eastern corner of Piccadilly and Dover Street. The promoters have had many promises of support from good quarters, and the scheme is expected to materialise shortly. Particulars may be obtained from the joint secretaries and managers, Messrs. H. Gibson and E. J. W. Hider, 68A Piccadilly, W.

THE Manchester Ship Canal Company have entered into an agreement with the Manchester Dock and Warehouse Extension Co., Ltd., who constructed the No. 9 dock and transit sheds and leased the property to the company for the term of 99 years dating from the year 1902, under which they have undertaken to provide on the same terms as before the sum of £400,000 for the construction of a second grain elevator and increased transit shed accommodation and other appliances at the Manchester docks.

BIRMINGHAM City Council last week sanctioned a town planning scheme for East Birmingham, at a cost of £69,000. The district comprised in the scheme covers an area of 1,443 acres, and Mr. Neville Chamberlain explained that this area had been divided into three zones, in one of which eighteen houses to the acre would be allowed; in another, which was more or less agricultural, twelve houses to the acre; and in the third, fifteen houses to the acre. Provision had also been made for three factory areas.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects and others are invited to submit full particulars for insertion in this weekly list.)
ENGLAND.

BERKSHIRE.

Bisham.—Cottage, Quarry Woods, for Sir H. J. Vansittart Neale.

Bray.—"Compton Chase," Windsor Road: additions for Mr. C. M. Steele.

Cookham.—"Lodge Lodene," Greys: additions for Mr. D. Jay.

Pair of cottages, Bath Road, Highway Estate, for Mr. T. B. Bissley.

Hurley.—Six cottages, Parkwood, for Sir C. Henry, Bart.

Maidenhead.—Cottage, Malvern Road, Furze Platt, for Mr. B. Webb.

Cottage and motor garage, "Somerlea," Maidenhead Court, for Mr. J. B. Kennedy.

Pinkney's Green.—"Moorlands": additions and alterations; also to gardener's cottage, for Mr. C. F. Kearley.

CHESHIRE.

Bickley.—St. Winifred's Church: Vestry. Mr. Hopley, architect.

Birkenhead.—Town Hall, Wallasey.

St. Mark's Church: Tower (£900).

Whaley Bridge.—Offices for the Central Co-operative Stores and Society.

Wilmslow.—Catholic Church.

CORNWALL.

Wadebridge.—Parochial Hall, St. Breock.

DERBYSHIRE.

Clowne.—Parish Church: enlargement (£2,500).

Derby.—Boys' Secondary School (£12,000).

Girls' Secondary School (£10,000).

Two Council Schools (£20,000).

Morton.—Parish Church: extension (£850).

DEVON.

Exeter.—Royal Albert Memorial: men's hostel.

DORSET.

Weymouth.—Flats, St. Leonard's Road. Mr. S. Jackson, architect; also

Alterations to "Lambourn," Glendinning Avenue.

Two houses, Bentpath Avenue, for Mr. J. T. Whettam, junr.

Four houses, King's Road, Radipole, for Mr. T. J. Clarke.

Lock-up shops, John's Court, Lower Bond Street, for Mr. W. Smith.

DURHAM.

Crookhill.—Sunday School, for the Stargate Wesleyan Society (£1,000). Mr. G. Bell (of Newcastle), architect.

Mr. T. Charlton (of Newburn), contractor.

Seaton Carew.—Council School.

ESSEX.

Burnham-on-Crouch.—Two cottages, Coney Hall, for Messrs. Strutt & Parker.

Chelmsford.—House, Swiss Avenue, for Mr. Clough.

House, Goldlay Road, for Mr. T. G. Gozzett.

HAMPSHIRE.

Bournemouth.—Garage, Admiralty Road: additions for Messrs. Blachford Brothers.

Alterations, Lansdowne Crescent, for Messrs. Farrow's Bank, Ltd.

Additions to Convent of the Cross, Parkwood Road.

"The Fancy Fair," Hinton Road, for Mr. Beale.

Additions to Royal Bath Hotel.

House, plot 154, Talbot Avenue, for Mr. J. W. Davis.

Three houses, Portman Crescent, for Mr. R. Holly.

Two houses, Moorfield Grove, for Mr. A. Vine.

Pair of houses, Bemister Road, for Mr. A. J. Long.

House, corner of Boscombe Road and Southbourne Cliff Drive, for Mr. R. Elliott.

House, Leamington Road, for Mr. F. Holly.

House, plot 368, Milton Road, for Mr. S. M. Davis.

House, plot 28, Muccleshell Road, for Mr. R. Denning.

House, plot 55, Naseby Road, for Mr. E. Pearce.

Pair of houses, Roberts Road, for Mr. J. Houston.

"Ailsa Lodge," Stourwood Avenue: additions for Mr. T. G. Head.

"The Knowle," Meyrick Park Crescent: additions for Miss A. M. Newton.

"Nelson Villa," Curzon Road: additions for Mr. W. H. Price.

"Thurley," Lowther Road: additions for Mr. Paterson.

House, plot 346, Portchester Road: additions for Messrs. George & Harding.

Saugeen School, Manor Road: additions for Mr. P. H. Evans.

Vicarage, Windham Road, for Rev. T. F. Malpas.

KENT.

Bromley.—Workhouse: additions and alterations.

Chatham.—Cottages, Martin's Court, Union Street, St. Margaret: additions for Mr. W. Hurdman.

House, Patten's Lane, St. Margaret: additions for Mr. E. J. Simmons.

St. Catherine's House, Patten's Lane, St. Margaret: additions for St. Catherine's Charity.

Villa, Goddington Road, Strood Intra, for Mr. R. H. Cooper.

Hartley.—Mission Hall.

Hollingbourne.—Workhouse: additions. Mr. Gardner, engineer.

Lydd.—Council School: alterations, &c. Mr. W. H. Robinson, F.S.I. (of London), architect.

Maidstone.—Two houses, Curzon Road, for Messrs. Barden & Head and Lynn.

Warehouse, stables, &c., Hedley Street, for Mr. W. Bourne.

Orpington.—Motor garage, stables, and cottage, Crofton Pond Hill. Messrs. Treasure Bros., architects.

House, plot 13, The Drive, for Mr. R. Cooke.

LANCASHIRE.

Bolton.—Infirmary: Nurses' Home. Messrs. Henderson & Brown, architects.

"Swan" Hotel premises: additions. Messrs. Cunliffe & Pilling, F.R.I.B.A., architects.

Westhoughton.—Central Council School (£9,000) and Manual Training Centre (£600).

LEICESTERSHIRE.

Barlestone.—Council Schools.

Blaby.—Workhouse additions and alterations (£2,300).

Copt Oak.—(Supplementary to June 12)—Vicarage (£1,700).

Desford.—Bungalow, Leicester Road, for Mr. E. Robinson. Out-offices for the County Council.

Nailstone.—House, for Mrs. E. Haywood.

Peckleton.—Two cottages, for Lady Lovelace.

MIDDLESEX.

Ealing, North.—Wesleyan Church, Hall and School, Lindfield Road (£1,600).

Twickenham.—Council School (£11,000).

NORTHAMPTONSHIRE.

Towcester.—Houses, for the R.D. Council.

NORTHUMBERLAND.

Ponteland.—Public Hall (£1,500). Mr. D. Hill (of Newcastle-on-Tyne), architect.

NOTTINGHAMSHIRE.

Pleasley Hill.—St. Barnabas's Church: extensions (£1,550).

SHROPSHIRE.

Albrighton.—Wesleyan Church Schoolroom.

SOMERSET.

Minehead.—Working-class houses. Council Surveyor.

STAFFORDSHIRE.

Burslem.—Union Offices: alterations. Mr. W. F. Slater, architect.

Newcastle-under-Lyme.—Congregational Sunday School: extensions (£1,100). Mr. T. H. Smith (of London), architect. Mr. A. Plevin, contractor.

Stoke-on-Trent.—C. of E. Schools, Fenton: additions and alterations.

Wednesbury.—Public buildings, baths, &c.: extension. Messrs. Guest & Sons (of Stourbridge), contractors (£8,500).

SUFFOLK.

Stowmarket.—Council School.

SURREY.

Croydon.—Salvation Army citadel, Brighton Road.

Guildford.—House, Avonmore Avenue, for Mr. W. Buller.

Hersham.—Public Elementary School for 500 places.

WARWICKSHIRE.

Birmingham.—Birmingham and Midland Women's Hospital: extension (£4,000). Mr. F. Martin, architect.

Coventry.—Factory additions, Spon Street, for Messrs. J. Rotherham & Sons.

Additions and alterations to premises, Bray's Lane and West Orchard, for the Coventry Perseverance Co-operative Society, Ltd.

WARWICKSHIRE—continued.

Coventry—continued.

Extensions to electricity works, Sandy Lane.
 Additions and alterations to premises, Spon Street, for the West End Club.
 Alterations to premises, West Orchard, for Mr. A. Mountford.
 Additions and alterations to premises, 26 Little Park Street, for Mr. J. R. Austin.
 Extensions, Park Side, for the Deasy Car Co.
 Additions and alterations to Boston House, Stoney Stanton Road, for the Wesleyan Methodist Trustees.
 Garage, &c., Gosford Street, for the Coventry Perseverance Co-operative Society, Ltd.
 Two houses and cycle shed, Broadway, for Mr. A. E. Stewart.
 Six houses, Hearsall Lane, for Mr. T. Philpotts.
 House, Holbrooks Lane, for Mr. F. J. Blackford.
 Two houses, Holbrooks Lane, for Messrs. Dunn & Vickers.
 House, Stoke Park, for Mr. E. O. C. Howells.
 House and shop, Albany Road, for Mr. C. F. Woodall.
 Six houses, Harefield Road, for Mr. E. J. Twigg.
 Nine houses, Highland Road, for Messrs. A. Goldthorpe & Co.
 Two houses, Mickleton Rd., for Messrs. C. Luck & Son.
 Two houses, Newdigate Road, for Mr. E. J. Rawdon.
 Six houses, Quinton Rd., for Messrs. T. Hancox & Co.
 House, Radford Road, for Messrs. Robinson Bros.
 Three houses, Raleigh Road, for Mr. C. Blockley.
 Three houses, Raleigh Road, for Mr. F. Burton.
 House, St. Michael's Road, for Messrs. Jervis Bros.
 House, Shackleton Road, for Mr. E. Jordan.
 Four houses, Sir Thomas White's Road, for Mr. W. Vaughan.
 Two houses, Sovereign Road, for Mr. F. H. Turner.
 Two houses, Stanway Road, for Mr. C. E. Needham.
 House and stable, Chandos Street, for Mr. F. J. Brookfield.
 Ten houses, Oliver Street, for Messrs. Kendall & Son.
 Extensions to machine shop, Canal Road, for Messrs. A. Herbert, Ltd.
 Additions to printing works, White Friars Lane, for Messrs. H. Smith & Son.
 Stabling, Cook Street, for Messrs. Masser & Mattocks.
 Extensions, Crow Lane, for Rudge-Whitworth, Ltd.
 Picture Palace additions, Hales Street, for Messrs. Pell & Co.
 Electric Theatre, Gosford Street, for Mr. F. H. Turner.

YORKSHIRE.

Marfleet.—"New Inn": re-building. Mr. W. Bail, F.R.I.B.A. (of York), architect.
 Masham.—Town Hall (£3,000). Mr. J. Houle (of Harrogate), architect.
 Middlesbrough.—No. 23 Corporation Road. Messrs. Moore & Archibald, architects; also
 Four dwelling-houses, Appleton Road, Linthorpe.
 Wincobank, High.—Fifty-five cottages. City Architect, Sheffield.

WALES.

Port Talbot.—Poole's Palace, Aberavon: alterations (£2,000).
 Ruthin.—Pendref Congregational Chapel: schoolroom. Mr. F. A. Roberts (of Mold), architect.

SCOTLAND.

Canonbie.—(Supplementary to August 2.)—Public Hall (£1,100). Mr. R. Burnet (of Langholm), architect.
 Separate trade contractors.
 Glasgow.—Drapery warehouse addition at 30-34 Paterson Street, for Scottish Co-operative Wholesale Society, Ltd.
 Taynult.—Board School: additions and alterations. Mr. G. W. Brenan, C.E. (of Oban), architect.

IRELAND.

Belfast.—Prudential Insurance Co.'s premises, Wellington Place. Mr. P. Waterhouse, M.A., F.R.I.B.A. (of London), architect.
 National Schools for the Strand Presbyterian Church. Messrs. Fennell (F.R.I.A.I., F.R.I.B.A.), & Clarke, architects.
 Donaghadee.—Orange Hall (£1,000). Mr. C. A. Aitkin (of Belfast), architect. Mr. W. Cochrane (of Belfast), contractor.
 Dublin.—Ice factory and cold storage, for the Dublin Pure Ice Co., Ltd. Messrs. H. Williams & Co. (of London), architects.

Dundalk.—St. Patrick's Cemetery: mortuary chapel (£1,200).
 Limavady.—Court House (£2,000).

Londonderry.—St. Columba's Boys' National School, Long Tower, Derry. Mr. D. Conroy, architect.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Root, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 4,183. Feb. 19, 1912.—Anton Kleber, 5 Wilhelmstr., Saarbrücken, Prussia. Improvements in adjustable casings for the construction of walls by means of plastic materials. This invention relates to casings for the construction of walls, and particularly inner partition walls, by means of plastic materials, such as plaster, cement, or concrete, and has for its object to provide an improved casing, the various parts of which may be adjusted according to the thickness of the walls to be constructed. Fig. 1 is an elevation, and fig. 2 a sectional plan. The reinforcement for the construction of the wall, *a*, is effected by tying oblique wires, *b*, and horizontal wires, *c*, which are further strengthened by vertical wires, *d*. These wires, *b*, *c*, *d*, are fastened at their opposite ends to the floor, side-walls, and ceiling already constructed. In fig. 1 the lower part of the wall *a* is being constructed about a door frame 2. The boards of the casing or mould have laths, *f*, to which flat iron bars, *g*, are fastened by means of screws, so that the boards or planks placed above each other are prevented from being displaced inwardly. The casings are put in place as follows: The sockets, provided with flanges, have inner screw-threads engaged by the outer screw-threads of another socket or sleeve. *i*. If the thickness

Fig. 1.

Fig. 2.

of the wall be x , each sleeve or socket, *i*, is unscrewed until it extends to a distance $\frac{x}{2}$ from the socket, whereupon the latter is placed into the boards, *e*, of the casings and a bolt, *k*, is inserted into the sockets *i*. A crank handle, *l*, screwed on to the end of said bolt is rotated until the ends of the two sockets, *i*, touch each other, whereby the thickness of the wall is determined. The bolt, *k*, has at one end a square portion engaging a corresponding hole in the plate, *n*, whereby the bolt is prevented from being rotated. In order to tightly close the joint, another plate, *o*, is placed upon the opposite end of the bolt *k*. Both plates, *n* and *o*, are pressed against the boards, *e*, of the casings. The boards of the opposite casings are connected as described on both sockets and bolts. Intermediate bolts, *p*, are arranged at suitable intervals, and extending through the laths, *f*, which are provided with metal plates, *g*. The bolts, *p*, which are preferably square in cross-section, have a number of holes, *r*, intended to receive the eccentric pin, *s*², of a circular disc, *s*, provided with a handle, *s*¹. It will be seen that while the bolts, *k*, with the parts connected therewith serve to determine the thickness of the wall, the bolts, *p*, serve merely to stay the boards of the casings. The flanges prevent dirt or plaster from entering the sockets, so that the inner screw-threads thereof are constantly clean and ready for easy operation. June 26, 1912.

PATENT SPECIFICATIONS PUBLISHED AUGUST 1, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 15,479. July 3, 1911.—William Turnbull, architect, Lambton Quay, Wellington, New Zealand. Flushing apparatus for water closets.

7,801 and 7,802. April 1, 1912.—Robert Green, Roecliffe, near Boroughbridge, York. Improvements in roofing tiles, brick and tile manufacture.

8,596. April 11, 1912.—J. A. Murdocke, 11 New Union Street, E.C. Hinges.

12,139. May 22, 1912.—Date claimed under International Convention Dec. 1, 1911. Diamant-Brickett-Werke, G.m.b.H., 2511 Taubenstr., Berlin, W. Briquette presses.

THE INSTITUTION OF MUNICIPAL ENGINEERS.

At a meeting of the Council held on July 24 the following applicants were recommended for admission:—To Membership: John Morley, surveyor and engineer, Ardsley U.D.C.; H. W. Lockton, deputy borough surveyor, Newark; W. H. Scott, assistant surveyor, Ruislip-Northwood U.D.C.; W. W. Earwaker, sanitary surveyor, St. Columb R.D.C. To Associate Membership: W. A. Walker, surveyor's office, Stourbridge; J. C. Stevenson, assistant surveyor, Ulverston U.D.C.; S. Grisdale, district main road surveyor, Cumberland C.C.; S. L. Kumar, P.W.D., Punjab, India; R. U. Harper, assistant highway surveyor, Chester-le-Street R.D.C. Transfer to Membership: W. H. Butler, assistant County surveyor, Cumberland. Transfer to Associate Membership: J. H. Marsh, surveyor's office, Worsley U.D.C.; A. R. Clucas, assistant city engineer, North Vancouver, B.C.

The consideration of papers presented by members of the Institution will take place at the September Council meeting, with a view to awarding the premiums already announced.

Mr. W. Louis Carr has kindly extended invitations to members to view his town plan, maps No. 4 and 4a with general provisions. They may be seen at his offices, Northwood, Middlesex.

Mr. Frank Latham was nominated President and Mr. Thos. Mundy Honorary Treasurer for the year 1912-3. The nominations for Vice-Presidents will be announced later.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

CERTIFICATES gained during the summer term by the students of the Crystal Palace School of Practical Engineering were distributed at the lecture room there last week by Sir Maurice Fitzmaurice, supported by Mr. I. W. Wilson (Principal), Mr. Maurice Wilson (Vice-Principal), and the examiners, Mr. H. G. Foster Barham, Mr. H. T. Creasy, and Mr. Burr.

Sir M. Fitzmaurice, in the course of his address, said he knew from personal experience that the school was keeping up the reputation it had for many years, and being a member of the Council of the Institute of Civil Engineers, he noticed that a large number of the old students of this school came forward for election as associates, with good credentials, and a record of good work. He had had, moreover, old students of the school on his staff, and their work had always been satisfactory.

Much of the engineering work going on abroad was being done with English capital, and those who found the capital wanted English engineers to carry out the work. In case of disputes between engineers and contractors, they must always be fair, as a reputation for fairness was one of the greatest assets they could have. They had got to learn something every day, and they had to become old before they found out what a little they knew. In conclusion he urged that they must work hard, be loyal to the men who paid them, and get a reputation for honesty and fairness in all their dealings, and if they did this, they would be a credit to the Crystal Palace Engineering School.

MR. R. H. FORSTER writes as follows to the Editor of the *Newcastle Daily Journal* relative to the excavations at Corbridge:—Your readers will be interested to hear that we have this morning found a large altar, bearing the inscription:

DISCIPVLI
NAE
AVGVSTORVM
LEG. II
AVG.

"To the Discipline of the Emperors (dedicated by) the Second (Augustan) Legion."

Two days ago we found a centurial stone, originally erected by the Seventh Cohort of the Thirtieth Legion. Yesterday there came to light a striking relief of Hercules, brandishing a club. The excavations are now in full working order, and several interesting buildings are being uncovered.

GREAT CENTRAL RAILWAY SUMMER SERVICE.

THE Great Central Railway Company announce that their summer train service came into operation on July 15.

The chief innovation relates to the 8.50 A.M. breakfast car express from Sheffield to London (Marylebone) and the 8.20 A.M. restaurant car express from Manchester. The former now starts from Manchester (London Road) daily at 7.40 A.M. instead of at 7.45 A.M. on Mondays only as hitherto, and is in connection at Penistone with a new train from Bradford, Halifax and Huddersfield. This improvement supplies a useful early service from Manchester and other towns to London. The 8.20 A.M. breakfast car express from Manchester (London Road) to London (Marylebone) runs to Bath, Bristol and Taunton, with through carriages to Ilfracombe. The return train will leave Ilfracombe at 12.17 P.M. and Taunton at 3.3 P.M.

Between London (Marylebone) and Stratford-on-Avon, via Woodford and Hinton, the service is increased and accelerated. A new train in connection with the 10 A.M. express from London (Marylebone) will reach Stratford-on-Avon at 12.12 P.M. In the opposite direction the train will leave Stratford-on-Avon at 10 A.M., and will make the same connection with the Manchester breakfast car express due to arrive at Marylebone at 12.3 P.M.

As in previous years, the tourist express from Liverpool, Warrington, Stockport, Manchester and Sheffield to Yarmouth and Lowestoft is being run. These trains are composed of corridor carriages with restaurant car.

The combined rail and sea trips to the Isle of Man and Llandudno proved very popular last year, and are repeated.

A tourist express leaves Sheffield (Victoria) at 7.30 A.M. on Mondays, Tuesdays and Saturdays in connection with the steamers from Liverpool to Douglas, Llandudno and other places. The return train starts from Liverpool (Central) at 8.33 P.M. A tourist express leaves Sheffield (Victoria) at 9.5 A.M. and Manchester (Central) at 10.50 A.M. for Aberystwyth and other resorts on the Cambrian Railway. The return train leaves Aberystwyth at 1.50 P.M., with connections from the principal stations on the Cambrian Railway.

VARIETIES.

THE Electric Supply Committee of the Birmingham City Council are about to advertise for a constructional engineer at a salary of £400 rising to a maximum of £500 per annum.

IN the Slade School of Fine Art, at London University, a special diploma course has been instituted, enabling students who take full-time courses, and who satisfy the conditions governing the diploma course, to obtain a University Diploma in Fine Art.

THE mediæval building in St. Michael's Square, Southampton, known as Tudor House, which has been purchased by the Corporation for £4,200, and its interior adapted into a museum for historical relics connected with Southampton in particular, and with Hampshire generally, was last week declared open by the Mayor of the borough.

THE scheme for the erection of a new Custom House at the pierhead at Liverpool was before the Liverpool City Council last week. The Chancellor of the Exchequer has promised to erect a building, the cost of which is estimated at not less than £100,000, provided the Corporation contribute the site. The Mersey Docks and Harbour Board have promised £10,000 towards the site, and to convey to the Corporation the site and buildings of the old dock office in Canning Place. The recommendation to provide a site was finally agreed to.

ON Friday, July 26, the Bishop of Ripon dedicated a new tower to Leeming Church, near Bedale, Yorks. The tower is built of local bricks with traceried windows of stone, and with stone pinnacles and battlements. It is 12 feet square and about 48 feet high, and has a peal of eight tubular bells by Harrington & Latham, of Coventry. The carving was executed by Messrs. Martyn, of Cheltenham. The sole contractors were Messrs. T. & J. Willoughby, of Northallerton. The architect was Mr. H. D. Pritchett, L.R.I.B.A., of Darlington, the total cost without bells being about £505.

H.M. TRADE COMMISSIONER for Canada reports to the Intelligence Department of the Board of Trade that, according to the "Montreal Gazette" of July 3, a company has been formed, with a total authorised capital of 6,500,000 dollars (about £1,336,000), for the establishment of a chain of terminal warehouses from Montreal to the Pacific Coast, in connection with the Grand Trunk Pacific railway systems. The names of the companies, &c., to

which the foregoing notices relate may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

MESSRS. BRAITHWAITE & KIRK, engineers, of West Bromwich, have taken an important contract for six steel spans for a bridge on the Eastern Bengal State Railway, over the Lower Ganges. The remaining nine spans will be supplied by the Cleveland Bridge and Engineering Co., of Darlington. The contracts were secured in face of severe American and Continental competition. Each span will be 359 feet long, and will weigh 1,300 tons. The completion of this Indian undertaking, including approaches, &c., will, it is said, involve an outlay of about one and a quarter millions sterling.

ACCORDING to an American trade report, the production of Portland cement in the United States in 1910 reached 76,549,951 barrels, valued at £13,641,160. This is equivalent to 12,986,152 long tons, and is an increase over the output of the previous year of 11,558,520 barrels, or nearly 18 per cent., and an advance in value of £3,069,489, or more than 29 per cent. The remarkable growth of the American production of this cement is shown in the fact that this increase alone is greater than the total output in 1900. In addition to Portland cement, there were also produced 1,139,239 barrels of natural cement, and 95,951 barrels of puzzolan cement, a total of 77,785,141 barrels.

ON Saturday week Mr. and Mrs. John E. Sheldon entertained the directors and staff of Messrs. Harris & Sheldon, Ltd. (the well-known Birmingham shopfitters), at their house, "Moor Croft," Barnt Green. The chief event of the afternoon was a cricket match of 25 a side between the brass-foundry department staff and the draughtsmen and estimators of the joinery department; naturally with such a large field the difficulties of opposing batsmen were enormous, much humour being occasioned thereby. Mr. R. G. Richards captained the "B" department, and Mr. Sheldon the "J" department, and at the interval tea was served on the terrace, the Misses Sheldon ably assisting to entertain the guests. After the game was over parties were made up for woodland strolls, whilst others availed themselves of the many opportunities provided for amusement by games of tennis, bowls, &c., the lawns being in a remarkably good condition. At dinner covers were laid for some sixty guests, and a very happy party it was, everything being done that was possible to give the staff a really good time. In the cool of the evening, the garden, roseries, &c., were visited, their beauty appealing strongly to the many city-dwellers; going home time came all too soon, and the thanks of all present were given to Mr. and Mrs. Sheldon for providing so enjoyable an outing.

TRADE NOTES.

MESSRS. JOHN WARNER & SONS, of "The Spitalfields Bell Foundry," Spelman Street, London, N.E., have in hand two bells to be rung by electricity, for the New Girls' Training College, Swansea, and New Schools, Down Lane, Tottenham. The same firm has also supplied similar bells to the undermentioned places:—Risley Avenue Schools, Tottenham; Crowland Road Schools, Tottenham; Oldbury Road Schools, Enfield; Percy Road Schools, Kilburn; Cecil Road Council Schools, Gravesend; Lavender Road Schools, Enfield; St. Mark's Mission Hall, St. Helens, Lancs; St. Andrew's Church, Wimbledon; St. Paul's Church, Ealing; St. Luke's Church, Hornsey; St. Matthias Church,ulse Hill, S.W., &c.

MESSRS. SMITH, MAJOR & STEVENS, LTD., London and Northampton, have issued a leaflet on the subject of "Safety Locks and Automatic Lifts" in general and their own patent lock in particular. They point out that in a safety lift lock three distinct things have to be performed—viz. to shut the door or gate, latch it, and finally give current to the machine. Instead of trying to make these three things occur simultaneously, Messrs. Smith, Major & Stevens have brought out a patent lock which does them in an ordered sequence. First, the door or gate must be completely closed: till that is done nothing more can be effected. Next follows the latching of the door, and until that is securely done it is impossible to give current to the machine. Finally, current is given. On opening the door the reverse order is equally definite. They claim that by their system the "Safety Lock" is worthy of its name.

THE ring of eight bells of St. Mary's Church, Enfield, Middlesex (tenor 20 cwt.), are to be re-hung. The work of restoration has been entrusted to Messrs. John Warner & Sons.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

•• As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BELGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

PERFECT VENTILATION by means of the OZONAIR SYSTEM

Refer to OZONAIR LTD., 96 VICTORIA STREET, S.W.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelli Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelli. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelli.

CONTRACTS OPEN.

BOLTON-ON-DEARNE.—Sept. 6.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with Bolton-on-Deerne new school—viz., builder, joiner, slater, plumber, plasterer, painter, ironfounder and smith, and asphalter. The Education Architect, County Hall, Wakefield, and the Divisional Clerk's Office, Mexborough. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

BUILTH WELLS.—Aug. 28.—For building a fire station, &c. Mr. T. Smith, M.S.A., surveyor, Market Hall Buildings, Builth Wells.

CHELMSFORD.—Aug. 28.—For extension of fire engine station in Market Road. Mr. W. Smith, town clerk, 16 London Road, Chelmsford.

CHEPSTOW.—Aug. 20.—For the reconstruction of premises at Chepstow to be used as a drill hall, for the Monmouthshire Territorial Force Association. Deposit £2 2s. Messrs. Habershon & Fawckner, F.R.I.B.A., architects, 41 High Street, Newport, Mon.

CONGLETON.—Aug. 31.—For alterations at St. Peter's, St. James's, and St. Stephen's schools, for the Congleton Church of England Schools Joint Committee. Deposit £1 1s. Mr. J. Moir, Brereton Hall, Sandbach.

CRAIGHEAD.—For the erection of twenty houses for Messrs. Thos. Hedley & Bros. Send applications to Mr. J. Wm. Rounthwaite, A.R.I.B.A., 13 Mosley Street, Newcastle-on-Tyne.

CUDHAM.—Sept. 21.—For the erection of a Council School to accommodate 120 scholars, at Cudham, Biggin Hill, for the Kent Education Committee. Send application and £1 1s. deposit by Sept. 4 to Mr. Fras. W. Crook, Secretary, Caxton House, Westminster, S.W. (See advertisement.)

DARTFORD.—Sept. 2.—For the execution of certain works at the workhouse, West Hill. Messrs. Tait & Hobbs, architects, Lowfield Street, Dartford.

EAST BARNET.—Aug. 29.—For alterations and additions at the Brunswick Park County Council school, East Barnet, for the Hertfordshire County Council. Deposit £2 2s. Mr. U. A. Smith, county surveyor, Hatfield.

GATESHEAD.—Aug. 26.—For erection of new entrance lodge, Saltwell Cemetery. Deposit £1 1s. Mr. N. P. Pattinson, borough engineer, Town Hall.

GLOUCESTER.—Aug. 31.—For erection of proposed infirmary in Great Western Road, for the Guardians. Send names by Aug. 31 to Mr. W. B. Wood, A.R.I.B.A., architect, 12 Queen Street, Gloucester.

GOLCAR.—Sept. 6.—The West Riding Education Committee invite whole or separate tenders for the following works at Crow Lane Council school, Golcar—viz., additional classroom (builder, joiner, slater, plumber, plasterer, and painter). The Education Architect, County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

HARROGATE.—For the whole of the work in connection with building the Theosophical hall and lodge premises in East Parade. Forward names to Mr. J. E. Reid, L.R.I.B.A., architect, Whitby Avenue, Heworth, York.

HARROW.—Aug. 30.—For the various works required in additions to ham and bacon factory at Harrow, for Messrs. John Adamson & Co., Ltd., Harrow and London. Send names and £1 1s. deposit at once to Mr. M. Johnstone, architect and engineer, 22 Lowther Street, Carlisle.

HUTHWAITE.—For the erection of a free library. Deposit £2 2s. Mr. E. W. Bostock, architect and surveyor, Huthwaite, Notts.

HYDE.—Aug. 31.—For erection of a public hall, police courts, offices, and other works in Corporation Street, Water Street, and Greenfield Street, for the Corporation. Deposit £3 3s. Mr. J. Diggle, A.M.I.C.E., borough surveyor, Town Hall, Hyde, Cheshire.

IRELAND.—Aug. 21.—For alterations and improvements at the Methodist church, Dunmanway. Messrs. Chillingworth & Levie, civil engineers and architects, 11 South Mall, Cork.

IRELAND.—Aug. 23.—For erection of coastguard station at Laurence Cove, Bere Island, County Cork. Deposit £1. The present Coastguard Station, Laurence Cove, and District Office of Public Works, Cork.

IRELAND.—Aug. 26.—For building new stables at their depot in East Hanover Street, for the Dublin Paving Committee. The City Architect, Municipal Buildings, Cork Hill, Dublin. Send £2 deposit to the City Treasurer, Municipal Buildings, Dublin.

IRELAND.—Sept. 9.—For the erection of New Dublin Metropolitan Police Station in Great Brunswick Street, Dublin. Deposit £1. Mr. H. Williams, secretary, Office of Public Works, Dublin.

IRELAND.—Sept. 18.—For the construction of Government Offices in Upper Merrion Street, Dublin. Deposit £5 5s. The Secretary, Office of Public Works, Upper Merrion Street, Dublin.

LANCHESTER.—Aug. 22.—For supply of a corrugated iron shed, for the Guardians. Mr. T. E. Taylor, architect, The Grove, Lanchester, Durham.

LEEDS.—Aug. 20.—For the various works required in the alterations to offices, Bedford Street, East Parade, for the Leeds Board of Guardians. Mr. G. Fredk. Bowman, architect, 5 Greek Street, Leeds.

LEEDS.—Sept. 4.—The Commissioners of H.M. Works and Public Buildings invite tenders for the erection of Leeds new telephone exchange. Deposit £1 1s. The Postmaster, Leeds Post Office.

LONDON.—Aug. 21.—For erection of Greenwich telephone exchange, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. J. Rutherford, 22 Carlisle Place, London, S.W.

LONDON.—Aug. 22.—For alteration and extension of boiler house at the workhouse, Swaffield Road, Wandsworth, for the Guardians. Deposit £2. Mr. F. W. Piper, clerk, Guardians' Offices, St. John's Hill, Wandsworth.

LONDON.—Sept. 2.—For the execution of certain alterations (chiefly in joinery and fittings) to dormitories, &c., at their infirmary, Cambridge Road, E., for the Bethnal Green Board of Guardians. Mr. D. Thomas, clerk, Bishop's Road, Victoria Park, London, N.E.

LONDON.—Sept. 11.—For proposed additional room and work in connection therewith at the offices, 45 Upper North Street, Poplar, E., for the Poplar Board of Guardians. Send applications and £2 2s. deposit by August 26 to Messrs. J. & W. Clarkson, architects, 136 High Street, Poplar, E.

LONDON.—Sept. 12.—For erection of the buildings required for an extension of their electricity works at Millfields Road, Clapton, N.E., on the river Lea, for the Hackney Borough Council. Messrs. Gordon & Gunton, architects, Finsbury House, Blomfield Street, E.C. Send £2 2s. deposit to Mr. W. A. Williams, town clerk, Town Hall, Hackney.

MARSHFIELD.—Aug. 19.—For erection of four houses at Marshfield, Mon. Send names by Aug. 19 to Mr. W. Rosser, architect and surveyor, Risca and Newbridge, Mon.

MINEHEAD.—Sept. 1.—For the erection of convenience and ladies' cloakroom on the sea front, Minehead, Somerset, for the Urban District Council. Deposit £2 2s. Mr. L. C. Webber-Incedon, clerk, 3 Bancks Street, Minehead, Somerset.

NEW WATH.—Aug. 23.—For the construction of a new stone road bridge at New Wath, near Goathland, for the Whitby Rural District Council. Drawings and specification may be seen at the office of Mr. J. Lyth, surveyor to the Rural Council, Whitby.

NORTHWICH.—Aug. 29.—For erection of public baths and wash-houses, for the Urban District Council. Deposit £2 2s. Mr. J. A. Cowley, clerk, Council Offices, Northwich.

PONTYPRIDD.—Sept. 2.—For erection of proposed new offices in Courthouse Street, Pontypridd, for the Guardians. Deposit £3 3s. Messrs. A. O. Evans, Williams & Evans, architects, Court Chambers, Pontypridd.

PORTLAND.—Aug. 29.—For erection of a brick pumping station and foreman's cottage near the Friar Waddon Road, Upwey, together with the provision, fixing, and setting to work of two borehole pumps and 136 h.p. Crossley gas engine with suction gas plant complete, for the Urban District Council. Deposit £3. Mr. R. S. Henshaw, waterworks engineer, Council Offices, Portland.

RAWTENSTALL.—Aug. 22.—For the materials and labour required in the erection of cottages on Carr Farm estate, for the Corporation. Deposit £2 2s. Mr. J. Johnson, borough surveyor, Rawtenstall.

ROMNEY MARSH.—For erection of a cottage near Brookland, Romney Marsh, for the Kent County Council. Mr. A. Barker, county land agent, 38 King Street, Maidstone.

ROTHERHAM.—Aug. 31.—For erection of an extra unit at the destructor works in Rawmarsh Road, for the Corporation. The Borough Engineer's Office, Town Hall, Rotherham.

SCOTLAND.—For the erection of a new bakery at Ratho Station, for the Hillwood Co-operative Society, Ltd. Deposit 10s. 6d. Messrs. Robert Murray & Son, surveyors, 50 George Street, Edinburgh.

SCOTLAND.—Aug. 22.—For the mason, joiner, plumber, plaster, slater, glazier, and steel works of new operating theatre and additional nurses' accommodation at East Poorhouse, for the Dundee Combination Parish Council. Mr. T. M. Cappon, F.R.I.B.A., architect, 32 Bank Street, Dundee.

SCOTLAND.—Aug. 23.—For the mason, smith, joiner, plumber, slater, plasterer, asphalt, glazier, tile, and painter's work for school to be erected at Kinglassie, for the

Kinglassie School Board. Deposit 10s. 6d. Mr. G. C. Campbell, architect, Methil.

SCOTLAND.—Sept. 2.—For executing the mason, bricklayer, and steel works of extension of Fish Market along Albert Quay. Mr. W. Dyack, M.Inst.C.E., burgh surveyor, Town House, Aberdeen.

SOUTHAMPTON.—Aug. 23.—For building proposed new offices, Central and Mobilisation Stores, Carlton Terrace, for the Territorial Force Association. Deposit £2 2s. Mr. R. H. P. Bevis, A.R.I.B.A., architect, Elm Grove Chambers, Southsea.

SOWERBY BRIDGE.—Aug. 23.—For the mason's, carpenter's and joiner's, ironfounder's, slater's and plasterer's, and plumber's work required in reinstating after fire at Lower Willow Hall Mills. Messrs. R. Horsfall & Son, architects and surveyors, 22a Commercial Street, Halifax.

STAFFORD.—For new central premises in Salter Street, for the Committee of the Stafford Industrial Co-operative Society, Ltd. Send names and £2 2s. deposit to the Architect, Co-operative Wholesale Society, Ltd., 1 Balloon Street, Manchester.

STOCKPORT.—Aug. 26.—For erection of a boundary wall adjoining the Stepping Hill hospital, Hazel Grove, for the Guardians of Stockport Union. Messrs. Peirce & Son, architects, St. Petersgate, Stockport.

SULBY.—Sept. 10.—For erection of a new chapel, for the Trustees of Sulby Wesleyan Chapel. Mr. J. E. Teare, Athol Street, Douglas.

TIPTON.—Aug. 31.—For erection of engine and boiler house, &c., at the Tipton Gasworks, on foundations prepared by the Council. Mr. S. O. Stephenson, engineer, Gasworks, Tipton.

TRURO.—Aug. 29.—For the erection of four residences at The Avenue, for Mr. W. Beard. Mr. Leonard Winn, architect and surveyor, 27 Boscawen Street, Truro, and the Free Library Chambers, Redruth.

WALES.—Aug. 21.—For contract No. 3 of proposed extensions of their works at Lower Penarth, near Cardiff, for the Directors of the South Wales Portland Cement and Lime Co., Ltd. The works comprised in this contract are heavy excavations, concrete, masonry, and brickwork, with other contingent items necessary for the erection of the various buildings and machinery foundations. Deposit £5. Mr. J. W. Rodger, architect, 14 High Street, Cardiff.

WALES.—Aug. 22.—For erection of a chapel in Pomeroy Street, Bute Docks, Cardiff, for the Trustees of the Mount Stuart Welsh Congregational Church. Deposit £1 1s. Messrs. James & Morgan, architects, Charles Street Chambers, Cardiff.

WALES.—Aug. 26.—For altering and repairing the following hotels for Messrs. A. Buchan & Co., Rhymney—viz., Tredegar Arms, Tredegar; Beaufort Inn, Beaufort. Mr. T. Roderick, architect, Clifton Street, Aberdare.

WALES.—Aug. 27.—For the erection of an electric theatre in Pembroke Dock, South Wales. Deposit £1 1s. Mr. A. Claypoole, Starbuck House, Milford Haven.

WALES.—Aug. 31.—For additions and alterations to Holly Cottage, Ochry-Fool, Dyserth. Mr. J. Powell Jones, 33 High Street, Denbigh.

WALES.—Aug. 31.—For repairs and alterations to the Bethania C.M. schoolroom and vestry, Ruthin. Mr. F. A. Roberts, M.S.A., architect, Earl Chambers, Mold.

WALES.—Aug. 31.—For building new stores at Llandilo, for the Farmers' Co-operative Society, Ltd. Messrs. G. Morgan & Son, architects, 24 King Street, Carmarthen.

WANSTEAD.—Sept. 12.—For erection of workshops on a site adjoining the receiving homes, Aldersbrook Road. Send applications and £1 deposit by Aug. 24 to Mr. William Jacques, A.R.I.B.A., architect, 2 Fen Court, Fenchurch Street, E.C.

WENDRON.—Aug. 29.—For erection of a cloakroom and porch for the Wendron Three Cross Schools. Mr. B. J. Treloar, Crahan, Wendron, Cornwall.

WORTHING.—Sept. 2.—For the taking down, widening, and reconstruction of a portion of the sea pier at Worthing, Sussex, including the provision and erection of cast-iron piles, steel girders, beams, bracing, concrete floor, and other works. Deposit £5. Messrs. James Mansergh & Sons, engineers, 5 Victoria Street, Westminster.

YEOVIL.—For erection of an electric theatre, for Mr. A. Ward, Weymouth. Send names and £2 2s. deposit to Mr. P. B. Rigg, architect, Frome.

TENDERS.

THE BRITISH FIRE PREVENTION COMMITTEE'S TESTS.

Reinforced Concrete Floor Test.—The British Fire Prevention Committee on Wednesday last undertook some supplementary loading tests with a reinforced concrete floor (submitted by the United States Steel Products Co.), which had been under fire and water test on July 24 last, the fire and water test having been a four-hour one, and the standard of "Full Protection," Class B, having been obtained. "Triangle mesh" was used as reinforcing material. The report of the test was given in our issue of July 26.

The centre bay of the floor, measuring about 15 ft. by 7 ft. and being 5 in. thick, was to be loaded to 5 cwt. per ft. super., and records were to be taken of the deflection at certain intervals, the object of the test being to show that a floor of this type is still serviceable after a severe fire.

The tests were conducted by a sub-committee under the direction of Mr. Max Clarke, F.R.I.B.A. There was a considerable attendance of members of the committee and officials from the various Government and municipal departments concerned, who were received by Mr. Edwin O. Sachs, F.R.S. Edin. (Chairman of the Executive), Mr. Ellis Marsland (Hon. Secretary), and other members of the Council. The Principal of the St. Petersburg Fire Service College, who is studying the testing arrangements of the committee, was among the visitors.

During the afternoon various other materials which had been under fire test during July were also exhibited.

Results of Tests.—The British Fire Prevention Committee announce that a series of fire tests with the flame-proofing of textiles treated by the Snowdon process have resulted in the process being classified as making the materials under review "non-flaming," which means that less than 5 per cent. of a square yard of treated material burns in 60 seconds on the application of flame. The materials under review treated by the Snowdon process were scenic canvas (for theatres), curtain net and art muslin (as used in bazaars), and flannelette. Wadding and thin paper (as used by drapers for Christmas decorations), treated by the same process, likewise obtained this classification in some supplementary tests.

Impending Tests.—The committee's official fire tests with "Cellit" (a non-inflammable celluloid) will take place at the end of September, and the tests with asbestos cement roofing materials early in October, when there will also be further fire tests with glazing.

MASTER PAINTERS AT CHESTER.

THE forthcoming visit of the National Association of Master Painters and Decorators to Chester from September 17 to 21, gives promise of being a great success.

The Association have engaged the American Roller Rink for the month of September, and also Pageant House for the Convention week.

In connection with the Convention a very interesting Exhibition of Decorative Art and Manufactures relating to house decoration will be held.

The Exhibition opens on the Tuesday morning, his Worship the Mayor of Chester presiding, and Sir William Lever, Bart., has promised to open the Exhibition.

The National Association has put in the forefront of its endeavours the importance of training the young men engaged in the trade to an appreciation of the beauty of their craft.

A carefully-graded scheme of education is drafted for the apprentices, commencing with boys in the first two years of their apprenticeship, which forms one section. Another section is for boys under eighteen in the middle period of their apprenticeship, and a third section is for boys in the last period of their training. The curriculum embraces plain painting in all three grades, as good, sound painting is the basis of the painting trade on which all other work is built, and the executive properly attach the greatest importance to boys being soundly taught in this part of their work.

Another section common to the three grades is that of lettering and sign-writing, which is both a useful and a beautiful art. Recent years have seen a big development of this phase of decorative art, and the apprentices have kept pace with the general taste.

The tasks in the three divisions represent distinct grades of skill.

The useful arts of graining and marbling, stencilling, stencil cutting, and lining are common to the two higher grades, and the senior division has more advanced studies set them in sketch book studies, coloured original designs for interior decoration, and a time test for ornamental painting, so that it will be seen that a large and instructive field of work is covered.

For young men out of their time, up to the age of twenty-five, the Association has, in conjunction with the sister Associations of Scotland and Ireland, established a Travelling Scholarship of the annual value of £50, realisable in Italy. This year the competition falls due at Chester, and some excellent work is anticipated.

During its existence the National Association has expended on its educational work upwards of £3,000.

The Exhibition of Manufactures will prove of especial interest to the general public no less than the trade.

Time was when paint and varnish manufacturers exhibiting sealed up their exhibits in elaborate glass cases, through which one peered at uninteresting bottles of glass varnish and oils and champagne glasses of dry colours, set out in symmetrical array. To-day, wiser in his generation, the manufacturer shows his wares applied in a decorative form that interests the public equally with the specialist. The result is that the public come to these exhibitions to see the latest thing in tasteful decoration in the way of wall-papers, enamels, water-paints, colours, stains and varnishes, and they rarely go away disappointed. Information is imparted and knowledge gained which in the days to come, when the necessary redecoration comes round, the master painter reaps the fruit of.

The executive anticipate a large influx of members from all parts of England and Wales, and big contingents from the sister Associations in Scotland and Ireland, which will make Chester busy the third week in September.

The Netherlands are sending two gentlemen to represent the National Association of Master Painters there, and one of them is to deliver a lecture on the old gateways and houses of Holland, illustrated by lantern slides.

The routine business of the Convention will follow the usual course.

THE late Mr. Francis William Godfrey, head of the firm of Collins & Co., builders, of Gloucester, left estate valued at £162,427 gross and £145,906 net personalty.

THE will has been proved of Mr. Jonas James Bradshaw, F.R.I.B.A., of Greenmount, Heaton, Bolton, architect and surveyor, of the firm of Messrs. Bradshaw & Gass, who died in April last, aged 75 years. He left estate of the gross value of £24,091, of which the net personalty has been sworn at £17,188.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.**A LIST OF WORKS PROJECTED OR COMMENCED.**

(N.B.—Local Authorities, architects and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.**BUCKINGHAMSHIRE.**

High Wycombe.—Primitive Methodist Church at Sands.

CORNWALL.

Charlestown.—Vicarage.

Morval.—Farm buildings and dairy, Lydcott Farm.

DERBYSHIRE.

Monsal.—Hospital: Crèche ward (£900).

DEVON.

Exeter (near).—Children's Home, Church Road, St. Thomas: isolation wards.

Newton Abbot.—No. 14 Wolborough Street: additions and alterations, &c. Messrs. Ellis, Son & Bowden, F.S.I. (of Exeter), architects.

DORSET.

Weymouth.—Pair of houses, Roman Road, Radipole, for Mr. A. J. Samways.

DURHAM.

Hartlepool.—Council School, Throston.

ESSEX.

Chelmsford.—House, Swiss Avenue, for Mr. W. Wright.

Dovercourt.—Ninety houses, &c. (£50,000.)

Tilbury.—Workmen's dwellings.

GLOUCESTERSHIRE.

Bristol.—Municipal tuberculosis dispensary.

HAMPSHIRE.

Bournemouth.—"Wrentham Lodge," Grove Road: additions for Mrs. Brewster.

Primitive Methodist Chapel Schoolroom, Bourne Valley (£1,200).

HEREFORDSHIRE.

Withington.—Wesleyan Church.

HERTFORDSHIRE.

Harpenden.—National Children's Home and Orphanage: various blocks.

KENT.

Beckenham.—Vicarage, St. Barnabas.

Chatham.—Club Room, St. John's Institute, Pazitt Street.

Six cottages, Elm Avenue, for Mr. A. G. Webb.

Two cottages, Wyles Road. Mr. Randall, junr., architect; also

Six houses, Ewart Road.

House, Athelstan Road, for Mr. H. P. Hughes.

Three houses, Maida Road, for Mrs. E. Waycott.

Sub-station, Magpie Hall Road, for the Kent Electric Power Company.

Dartford.—Public Hall.

Faversham.—Motor Garage, Preston Street, for Mr. P. Black.

Gravesend.—Gas Producer House: extension for Messrs. Henley's.

Lydd.—House, Hammond's Corner, for Mr. L. Wimble.

Margate.—Refuse destructor, Cliftonville.

Orpington.—"Lancaster Lodge," High Street: additions for Mr. A. Weirwood.

LANCASHIRE.

Bacup.—Weaving shed, Olive Mill, for Messrs. Hoyle Brothers.

Bolton.—Brewery extensions, Churchgate, for Mr. J. Kenyon.

House, Andrew Lane: Messrs. Bradshaw & Gass, F.F.R.I.B.A., architects.

Twenty-two houses in Ashworth Lane, Hesketh Avenue and off Blackburn Road, for Mr. G. Sykes.

Two houses, Belmont Road, for Messrs. Makin & Margisson.

Two houses, Junction Road, for Messrs. Andrews & Cowley.

Fourteen houses, Old Road, for Mr. G. Sykes.

Twelve houses, Daffodil Street, for Mr. P. W. Emery.

Four houses, Georgina Street, Hulton, for Messrs. Hughes Brothers.

Picture Hall, Blackburn Road, for Mr. W. F. Bowen.

Premises, Old Hall Street North: additions for Messrs. Adamson & Barlow.

Wilkinson Sanatorium, Astley Bridge: Ward. Messrs. Bradshaw & Gass, F.F.R.I.B.A., architects.

Congregational School, Derby Street: extensions for Mr. J. G. Varley.

LANCASHIRE—continued.

Great Lever.—Eight houses, Lever Edge Lane, for Messrs. Eckersley & Charnley.

Heaton.—Motor garage, Arden Lea, for Mr. A. H. Lord.

Lostock.—House, Wingates Lane, for Mr. T. Brindle.

LINCOLNSHIRE.

Benington.—Council cottages.

Caistor.—Isolation Hospital, administrative block, fever blocks, &c.

Lincoln.—Two houses, Kingsway, for Mr. C. Priestley.

Six houses, Derwent Street, for Mr. W. H. Close.

Two houses, Olive Street, for Mr. F. Berry.

Lodge, Greetwell Road, for Mr. C. Pratt.

Glasgow.—Tuberculosis hospital (£60,000).

Kirkcubbin.—Board School for 200 places.

Largs.—Garage. Messrs. Fryers & Penman, architects.

Paisley.—Convent, East Buchanan Street: addition.

IRELAND.

Limerick.—Sixty-six artisans' dwellings. Mr. J. Connolly, contractor (£12,500).

Middleton.—Fifteen working-class dwellings, St. Mary's Terrace. Mr. D. Daly, Council engineer. Mr. J. J. Coffey, contractor (£2,600).

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 9,910. April 24, 1911.—An improved building block and method of using same. W. A. Richards, 11 Dumfries Place, Cardiff, and E. R. Sutcliffe, of Leigh, Lancashire. This invention relates to the production of a special form of building block, and to the method of using same; it is applicable especially, though not necessarily, to bricks, or blocks which are made in a mould, either by hand or machine. The object of the invention is to produce such a form of block that it can be used without material alteration in all the various edging or corner positions to be found on a building, and especially which can be readily produced in a single mould without alteration of its inside perimeter. Figs. 1 and 2

Fig. 1

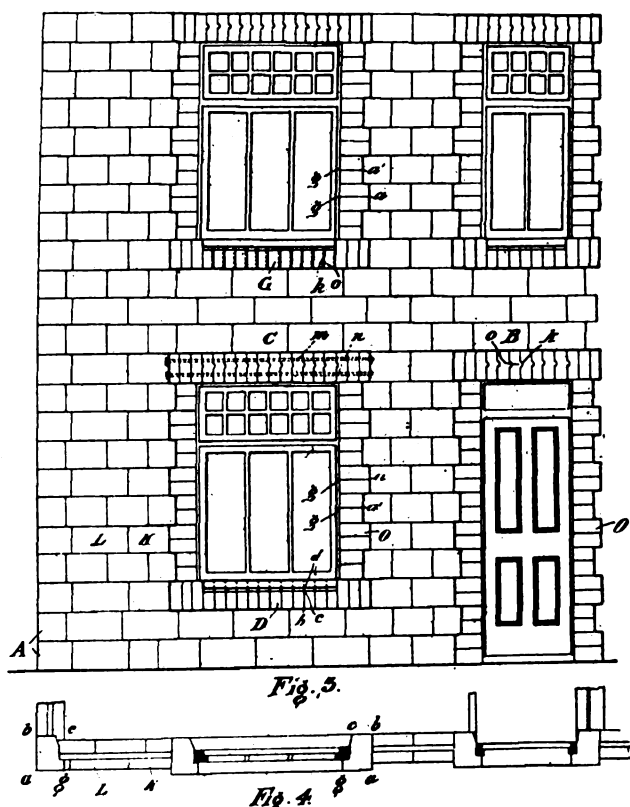

Fig. 2

show the form of the special block in plan and elevation respectively. Fig. 3 shows the front elevation of a house wall. Fig. 4 shows a plan of the wall. The two faces, *g a*, *a b*, of the perimeter of the block form a right angle, of which the face *a b* is longer than the face *a g*, so that when laid vertically over each other with a long face and a short face adjacent to each other, as at A, in fig. 3, a serrated effect is presented to each side wall forming the corner A of the building, by which proper bonding of the corner is effected to the plain blocks, such as K, L. The blocks, A, are shown in the drawing double the thickness of those used for the window and door openings, but two separate blocks could be used instead. The bonding for the window blocks is effected by putting a flat packing piece in the mould during manufacture, so that certain of the blocks are narrower across the faces *a g*, which is thereby reduced to *a' g*, as shown in fig. 1. The blocks, such as O, for the vertical sides of the openings are usually set with all the projections *e, f, g* on the

outside of the wall; the bevil faces *d*, *c* will then form a finished edge on the interior to the timber window frame. In the case of blocks for an arch, as shown at B, a rib, *o*, will

be left on one block and a recess, *k*, on the adjoining one, which together form a lock for the blocks. For an extended arch, holes may be made in the blocks and bars or bolts, *m*, *n*, inserted to bind the blocks more firmly together, as shown at C. The bevil portion, *c*, *d*, may be set either inwards, as at F, or outwards, as at E. In the case of the sill, D, the bevelled portion of the blocks will be set outwards, it being understood that the frame of the window is built in during construction to allow of the projections *e*, *f*, *g* being on both sides of it. To avoid any possible entrance of water through the joints of the sill, ribs and recesses, as at *o*, *k*, may be formed, but in the vertical direction, as shown at G. June 6, 1912.

PATENT SPECIFICATIONS PUBLISHED

AUGUST 8, 1912.

17,004. July 25, 1911.—William Smith, Fair View, Lower Gornal, near Dudley. Crushing and grinding mills.

17,223. July 27, 1911.—John Wilson, Auckland, New Zealand. Apparatus for use in building concrete structures.

18,091. Aug. 10, 1911.—Thos. C. Fawcett, Ltd., and J. W. Bottomley, both of Whitehouse Engineering Works, Hunslet Road, Leeds. Machine for dividing and loading clay and other substances or materials.

19,209. Aug. 1, 1911.—Daniel Atkinson, 1 High Lane, Ridgeway, near Sheffield. Safety clutch mechanism for elevator or lift apparatus.

20,679. Sept. 19, 1911.—Engelbert Prosig, Klein-Venedig, 7 Mahr-Schönberg, Austria. Manufacture of artificial slates and such like.

20,701. Sept. 19, 1911.—James Lee, 4 Martineau Road, Highbury, N. Houses, sheds, and like buildings.

20,877. Sept. 21, 1911.—J. C. Reuter, 52 Inkermann Street, Wolverhampton. Means for preventing the felonious opening of safe or strong-room doors.

21,503. Sept. 29, 1911.—Thomas Pittman, Homeland, New Road, Shepperton. Manufacture of varnish.

21,689. Oct. 2, 1911.—Karl Freund, 32 Goldsmith Road, Acton, and R. R. Kuhn, 27 Glasshouse Street, W. Means for fastening window sashes.

23,227. Oct. 21, 1911.—David Campbell, architect, The Hawthorns, Chorley New Road, Bolton. Movable water-excluding bar for casement windows, sashes and the like.

24,512. Nov. 4, 1911.—Date claimed under International Convention April 28, 1911. Edward Kersey, 950 Dakin Street, Chicago, Cook, Illinois. Flushing tanks.

24,677. Nov. 6, 1911.—W. H. Roughsedge, 64 Sparks Street, Ottawa. Construction of concrete buildings.

24,812. Nov. 7, 1911.—J. C. Edwards, Bryn, Howell, Llangollen. Manufacture of imitation stone blocks.

27,694. Dec. 9, 1911.—Edgar Holladay, 190 High Street, Exeter. Low-pressure hot-water heating apparatus.

28,888. Dec. 22, 1911.—G. C. Vernon-Inkpen, 40 Commercial Road, Portsmouth, architect, F.C.I.S. Concrete piles for foundations and similar purposes.

28,996. Dec. 23, 1911.—C. L. Wilson, Carlton Works, Armley, Leeds. Apparatus for the heating of water.

281. Jan. 3, 1912.—Solomon Barnes, 189 St. James Street, Montreal. Automatic moulding sand riddles.

702. Jan. 9, 1912.—Curt Bernhard, 41 Albersloherweg, and Wilhelm Leuer, 27 Bremerstr., Munster, Germany. Balusters.

1,802. Jan. 23, 1912.—L. W. Mulford, Narberth, Montgomery. Pavement-light, vault-light, and roof-light construction.

2,464. Jan. 30, 1912.—Samuel Spreckley, Ashen Road, Clare, Suffolk. Stoves for greenhouses, boilers or geysers for domestic and other purposes.

5,957. March 9, 1912.—Thomas Mason, Beaufort, Killarney. Window holders for sliding sashes.

6,028. March 11, 1912.—Date claimed under International Convention May 27, 1911. Matteo Tamburini, 310 Mill Street, Paterson, New Jersey, U.S. Combination locks.

6,967. March 21, 1911.—John Fothergill, Southbourne, Norton-on-Tees. Safety locking and latching devices for lift gates or doors.

7,891. April 1, 1912.—H. C. Ferron, 911 Prinsengracht, Amsterdam. Metallic roofing and the like.

9,506. April 22, 1912.—William Roper, 1220 Master Street, Philadelphia, Penns., U.S.A. Metal casements.

9,519. April 22, 1912.—A. G. Monro, Shamrock Hotel, Pall Mall, Bendigo, Victoria, Australia. Guard for closet seats.

11,580. May 15, 1912.—Date claimed under International Convention May 15, 1911. G. H. Inman, 630 North Twenty-Fourth Street, Camden, New Jersey, U.S. Safety devices for lifts.

MR. J. T. BLACKWELL, L.R.I.B.A., architect, Kettering, informs us that he has taken into partnership Mr. Charles Riddey, A.R.I.B.A., and that the practice will be carried on at his address, No. 53 High Street, Kettering, under the style of "Blackwell & Riddey."

THE Executive Council of the Amalgamated Society of Carpenters and Joiners announced on Saturday further advances of one halfpenny per hour at Bristol, Blackheath, Keighley, Kilmarnock, Loughborough, Montrose, Watford, Chepstow, Falkirk, Cambridge, and Goole. The membership of the society was returned at 74,683.

THE Health Committee of Glasgow Corporation last week considered a report dealing with the advisableness of establishing a hospital at Robroyston for consumption and smallpox patients. It was agreed to recommend that alternative offers be taken for constructing the building in ordinary construction and in composite construction. The statement showed a probable cost of £57,299 for ordinary construction, and £61,531 for composite construction. Accommodation would be provided for 210 patients meantime, but the plans admit of extension to accommodate 600 patients.

OTTAWA is the scene of great building activity, and the new private and Government buildings are requiring great weights of structural steel. Some seven or eight thousand tons are to be used in one departmental building, and there are many others to build during the next four or five years. Depending on its ultimate decision as to the water supply the city of Ottawa will want alternatively fifteen miles of steel piping or a series of water filtration plants. In Quebec, also, many important building trade developments are due within the next couple of years, and with the dock extension and railway terminal extension schemes, which are also approaching maturity, a largely increased demand for supplies of all and sundry kinds is assured. German firms are said to have profited from their policy of appointing local agents to sell their tools and pumps. United States makers of hardware are always at work by proxy of their own travellers and agents and their unending flow of catalogues.—*The Mercantile Guardian*.

GRIMSBY AND IMMINGHAM.

IN the Port of Grimsby and Immingham Annual, 1912, all the latest features in connection with the new docks and works at Immingham recently opened by H.M. the King are dealt with fully, and special attention is paid to the coal and fish trades of the port. As before, a large portion of the articles is translated into French and German. Over 4,000 copies of the last issue were circulated on the Continent alone, and shippers, traders and the Chambers of Commerce in the United Kingdom received it and commented favourably upon the work. From various parts of the world have come inquiries which show the extensive interest which has been created in mercantile centres. This is not surprising, inasmuch as alert business men everywhere are bound to appreciate the obvious advantages of economy, facility, direct communication with England's greatest trading centres, and absolutely untrammelled, continuous entrance and exit which the new port affords. It is not in the nature of commercial people to neglect such superior opportunities. As Mr. Alderman J. Sutcliffe, J.P., President of the Grimsby Chamber of Commerce, Vice-Chairman of the Humber Conservancy Board, &c., says in his Prefatory Note to the Annual, there is no doubt that, so far from having reached a zenith of prosperity, Grimsby and Immingham are but on the threshold of a vastly greater development, which will come only the faster from the unequalled advantages which the Great Central are now affording, and which the Company may be relied upon to continue to afford as the necessity or desirability arises. Fears have been expressed in some quarters that as the trade of Immingham grows, that of Grimsby will decline. These fears are wholly baseless, there being little doubt that the two ports will prove so mutually supporting that eventually the younger will be absorbed by the older, and the Immingham Dock will become only one of the many great docks existing at a far greater Great Grimsby. The signs of a vast manufacturing trade trending this way from the west, drawn by the unfailing magnets of coal and iron, are already portentous, and point to a future extension of commerce flowing in and out of Grimsby.

EXAMINATION FOR SMOKE INSPECTORS.

It has been urged upon the Council of the Royal Sanitary Institute that there is a need for some certificate of qualification for the post of smoke inspector, such as would indicate that they have a practical as well as a theoretical knowledge in those subjects of which it is necessary that they should be cognisant in order to satisfactorily carry out their duties. In order to meet this demand, and to afford an opportunity to inspectors in office and others of obtaining an evidence of qualification in the practical and administrative duties of this position, the Council have decided to institute a special examination and to award certificates. It is proposed to hold examinations in Manchester on April 18 and 19, and in London on May 2 and 3.

Syllabus of Subjects.

A knowledge of the laws, by-laws, and regulations affecting the emission or prevention of smoke, and methods of procedure in dealing with offenders.

A knowledge of the general principles underlying the production and transmission of heat; elementary chemistry of combustion.

Fuels: solid, liquid, gaseous; different kinds of coal in use; their attributes, the locality from whence obtained; special fuels.

Furnaces: the essentials of construction; various types in use, purposes for which they are used.

Chimneys: height, natural and artificial draught and its measurement; composition and temperature of escaping gases. Proportion of carbonic acid as an indication of furnace efficiency.

Stoking: principles and practice of stoking, mechanical stokers; other apparatus and appliances for improving combustion.

Smoke: nature and composition of; formation and predisposing causes; effect of various components of smoke on the atmosphere, vegetation, and buildings.

Smoke prevention in boiler and other furnaces, and in domestic fires; conditions of smokeless combustion, methods of measuring or estimating density and colour of smoke; smoke charts and instruments.

Other gases, dust, and effluvia produced by combustion; their reduction and prevention.

A general knowledge of the various industries in which furnaces are used, or from which products of combustion are given off.

The main outlines of the application of gas, oil, and electricity for the production of power in various industries.

Regulations.

1. Candidates must at the time of making their application produce satisfactory evidence of having had practical experience in connection with the working of furnaces.

2. Application for examination must be made on the proper form, and must be sent to the office of the Institute fourteen days before the date of the examination at which the candidate wishes to present himself.

3. The fee for the examination in Great Britain and Ireland is £3 3s. It must be paid to the secretary; 10s. 6d. on making the application, and the remainder at least one week before the day of examination.

4. Every candidate is required to furnish the Board of Examiners with satisfactory testimonials of recent date as to age and personal character; these should, if possible, be from a clergyman, medical man, or someone holding an official position.

5. The candidate must be able to write legibly, spell correctly, be able to make an outline sketch to scale, and read ordinary building plans, and must possess a fair knowledge of arithmetic: so that he may be able to prepare a report on any subject connected with his duties, creditable to himself and to the authority employing him.

6. The examination occupies a portion of two days. On the first day it consists of two written papers, two hours being allowed for each. The candidate may be required to make an inspection and write a report. On the second day the examination is *viva voce*, with one or more questions to be answered in writing, if required.

7. A certificate of competency, bearing the seal of the Institute, is granted to each successful candidate.

8. A certificate is not granted to any candidate under 21 years of age.

9. An unsuccessful candidate is allowed to present himself, at intervals of not less than three months, a second and third time for examination within two years of his first application on payment of half fees; but in every case the candidate must make application on the prescribed form previous to presenting himself for examination.

10. Any person having passed the examination and received the certificate for smoke inspector is, by virtue of having such certificate, upon proposal and election as associate of the Institute, called upon to pay only the reduced subscription of 10s. 6d. annually.

TRADE CONDITIONS IN WINNIPEG.

THE Imperial Trade Correspondent at Winnipeg (Mr. J. Appleton) reports to the Commercial Intelligence Department of the Board of Trade that extraordinary activity in building has increased the demand for supplies used in construction, a demand to which so many United States firms give special attention, with the result that their business has very largely increased, except in the case of terra cotta.

In the selection of interior fittings, builders' hardware, and the general equipment of buildings, the opinion of the architects employed usually prevails, and they determine the character of the purchases. It is of the utmost importance, therefore, says the *Board of Trade Journal*, that the firms engaged in the manufacture of building equipment of any kind should keep architects well informed as to the merits of the products for which a market is desired. In this respect the representatives of United States firms are particularly active. Supply firms catering for the wants of builders do not, as a rule, keep large stocks, but act as agents for the procuring of the supplies specified by architects. The fact of the proximity of the United States to Canada is often the deciding factor in procuring building supplies from there, because of greater certainty in getting delivery within a specified time.

As the population of the Western Canadian Provinces is rapidly increasing, it follows that trade opportunities will increase correspondingly.

Winnipeg is the chief trade centre for the provinces of Manitoba, Saskatchewan, and Alberta, and its trade has very largely increased during the past year, in consequence of the increasing population. That its trade will continue to increase is apparent from the fact that so much capital expenditure in the territory over which that spreads is already arranged for. In the case of the railway companies, appropriations already set aside for employment this year in the three prairie provinces named aggregate about £10,273,000, to be expended in constructing and equipping

new railways. Incident to this expenditure, local trade opportunities arise for the supply of building materials for the towns that spring up on the newly-built lines, and also the supply of the necessities for the new population. Local conditions determine the character of these equipments, and, so far, either Canadian or United States industry has successfully met them. The demands this year, however, will be very much greater than usual, because of the large general immigration, the purchasing power of the immigrants being increased by the large number of settlers with means coming from the United States.

The great factor in trade stimulation in the Canadian West this year will be, in the opinion of the Trade Correspondent, the unusually large capital expenditure in building and in railway construction. Although for some years it is probable that these expenditures will be large factors in the upbuilding of a very large and promising territory, it would not be reasonable to assume that in proportion to population so much money will, after a lapse of some years, be invested annually in the two enterprises referred to. Present conditions appear to warrant unusual expenditures, but they cannot be regarded as permanent factors in determining trade conditions, so much railway construction and so much structural building in new towns and cities being an abnormal condition. Following the extension of the railways into unsettled parts of the west, towns and villages will spring up, and as their inhabitants and those of the districts adjacent to them become settled, they will have other wants than those of shelter and implements of husbandry.

Attention is drawn to the practice of shipping agents in the United Kingdom marking packages for export with some "mark" by which the consignee is expected to identify them when they reach their destination. This practice has led to much confusion in Winnipeg. Consignees prefer to have their full names and addresses on each package, as this greatly facilitates handling.

THE REBUILDING OF SAN FRANCISCO.

DURING 1911 the rebuilding of that portion of the city which was destroyed by the fire of 1906 has been steadily going on, but according to the annual report of the British Consul many blocks yet remain unoccupied except by ruins.

The City and County Hospital and Courts of Justice have been completed at a cost of more than £416,600 and £208,300 respectively.

Progress has been made with the laying down of the auxiliary fire system. This may be completed in 1912. The estimated cost is £1,145,800. The salt water which is to be used in it will be taken from San Francisco Bay.

Other municipal works also under construction are: A new sewage system, to cost £833,300; a plant for disposing of the city refuse, costing £208,300, and schools of all grades, costing £1,166,600.

The following are under discussion at present, viz.:—

	To cost £
City Hall	937,500
City Opera House	208,300
California State Building	208,300
Public Hall or Auditorium	1,250,000
Public Library	104,100
Art Institute	104,100

The roads as a rule are well made and maintained. In many places, especially in the vicinity of towns, they are surfaced with crude oil. In the remoter districts, alongside the main roads, water tanks have been erected from which in summer time the roads are watered twice a day.

Considerable progress has been made in the preliminaries connected with the Panama-Pacific International Exhibition of 1915. The site has been fixed upon, and the first contract for the preparation of the ground has already been awarded. A sum of about £4,166,600 has been privately subscribed and voted by the State of California and the city of San Francisco towards the expenses of the exhibition.

It is estimated that on September 30, 1910, there were 540 industrial establishments in San Francisco, employing 24,000 hands, with an output valued at £24,240,000 per annum. The motive power used is oil or water-generated electricity. At present 446,000 horse-power is developed from 1,070 water wheels, and it is estimated that 9,000,000 horse-power can still be developed from the water-power available in the State of California.

No serious strikes took place during the year.

The population of San Francisco, according to the 1910 census, is 416,912.

VARIETIES.

THE Southport Council propose to erect a shelter near the South Marine Gardens to accommodate 3,000 people.

THE Earl's Court Exhibition authorities, in conjunction with the District Railway Company, propose to erect an immense hall in their grounds—the biggest in the country. The width of the floor space will be 300 feet, the length 500 feet, the total floor area, including the galleries, just under 400,000 square feet.

THE Mersey Docks and Harbour Board have approved an expenditure of over £11,000 for dock repairs and improvements. The items include £1,400 for repairs to a shed roof damaged by fire at the Alexandra Branch Dock, £1,230 for the relaying of lines and repaving of the road near the Alfred Swing Bridge, and £8,630 for the reconstruction of the dock wall and erection of a shed at the Salthouse Dock.

At a sitting of Clydebank Dean of Guild Court on Monday, Mr. Leslie Kirk, builder, Clydebank, presented plans for the laying out of new streets at Dalmuir Hill. It is intended that some 60 villas, detached and semi-detached, be erected on the ground to be laid out. The application was passed.

THE Education Committee of the Sunderland Corporation recommend the Council to proceed simultaneously with the erection of a day training college for teachers, and the addition of buildings to the Bede Collegiate School on the existing site at Cowen Terrace, making a total accommodation for 800 pupils, in accordance with plans submitted by Mr. G. T. Brown, architect.

THE Scarborough Corporation have decided to apply to the Local Government Board for a loan of £2,600 for an open-air swimming bath in front of Belvedere Gardens on the south side, and for a loan of £2,250 for the protection of the face of the cliff from the Children's Corner to Black Rock. It was also agreed to extend the promenade in the North Bay at a cost of £600, and to renovate the boat house at the Mere, and provide new boats at a cost of £400.

MANUFACTURERS and others contemplating the establishment of new works would be well advised to write to Mr. T. H. Rendell, the general manager of the Barry Railway Company, Barry Docks, who will be pleased to supply full particulars of the sites the company have available in the South Wales district, which offers exceptional facilities for economy in working, cost, and cheap and expeditious transit.

THE Copartnership Tenants' Society, through its educational department, has just awarded the scholarships and prizes offered to the employees who attended local classes and Polytechnics under the scheme drawn up a year ago. The total number of students taking technical classes at Hampstead, Letchworth, and Ealing was 173. The two £15 scholarships which are to be used for a Continental trip to study housing and town-planning have been awarded to Mr. George B. Cockerill, who is a prime cost clerk engaged at Hampstead, and Mr. Charles W. Sreeves, a foreman plasterer at the same place. The tour arranged for these students provides for their leaving London on August 30, and they will visit Cologne, Essen, Frankfurt, Bingen, Wiesbaden, Coblenz, Liege, and Brussels. The total number of applications for scholarships was 79, and in addition to the two scholarships eight consolation prizes have been awarded.

BILLIARD players and billiard enthusiasts will doubtless be keenly interested to hear that an opportunity of learning the secrets of George Gray's astounding play is now offered to them for nothing. In "Gray on Billiards" (published at 1s.) he clearly gives directions whereby if the enthusiast has the patience to practise and the necessary knack, he may perhaps become a rival. It's simply a matter of knowing how—and Gray explains that—and practice, plus practice, plus practice. Messrs. E. J. Riley, Ltd., of Accrington—the celebrated billiard table makers, upon one of whose tables Gray made all his records in this country—have secured the whole of the edition and will send a gratuitous copy on receipt of two penny stamps to cover cost of packing and postage. As the issue cannot be reprinted, application should be made at once.

TRADE NOTES.

UNDER the direction of Mr. H. Foxall, L.R.I.B.A., architect, Carlisle, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to St. Cuthbert's Roman Catholic School, Union Street, Carlisle.

THE Architect and Contract Reporter.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GOOLE.—Sept. 1.—The Council invite designs for municipal offices from fully-qualified professional architects. Two premiums of £30 and £15 are offered. Printed instructions containing full particulars will be forwarded upon receipt of a stamped addressed foolscap envelope, accompanied by a deposit of £2 2s., which will only be returned upon receipt of a design. The designs must be sent in not later than Monday, September 1. Mr. Robert Tyson, clerk to the Council, Council Offices, Goole.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelly.

CONTRACTS OPEN.

BARNET.—Sept. 3.—For the erection of twenty-two cottages in Totteridge Lane, within the urban district, for the Urban District Council. Deposit £1 1s. Mr. W. F. Wilkins, surveyor to the Council, 40 High Street, Barnet.

COMPETITION NEWS.

DARTFORD.—The Urban District Council are intending to invite competitive designs for a public hall and free library. It has been resolved to award premiums of £75, £50, and £25. The public hall is to seat 1,000 persons, the cost not to exceed £8,000, and £5,000 is to be expended on the library.

PONTEFRACT.—The Town Council last week adopted a scheme for the provision of new public baths. It was finally resolved by fourteen votes to four to accept the plans and estimates, with the provisional tenders, of Mr. A. Nunweek, of Sheffield, whose plans had been selected by the assessor, Mr. Brearley, of Leeds, as the most suitable amongst eighteen sets entered for competition ten months ago. The total cost, allowing £238 for contingencies, is estimated at £6,200.

WEST HARTLEPOOL.—The Town Council have decided to invite competitive plans for a new school.

FIRE LOSSES IN AMERICAN CITIES.

THE following is from a report by H.M. Consul-General at Boston on the trade of that district in 1911:—There seems to be a distinct awakening in recent years to the fact that fire losses in American cities are far higher than they should be. It has been shown that while the *per capita* fire losses of six European countries was 33 cents (1s. 4½d.), that of the United States was nearly 3dols. (12s.). Perhaps the greatest cause of this excessive fire loss is the prevailing custom of building the suburbs of most American cities in the cheapest and flimsiest style of wooden frame construction, covered with tar paper and wooden shingles, which are veritable bonfires when once ignited. Another reason, according to the secretary of the National Fire Protection Association, who spoke recently in Boston, is the poor quality of fire hose supplied by certain manufacturers. He stated that the quality had materially deteriorated during the past ten or twenty years, and remarked that there was no excuse for making such inferior quality. Strange though it may seem, it is stated on good authority that many fires are started by the combustion of "asbestos" packing for furnace pipes, &c. This material is, of course, spurious, being made of coarse hair with a dash of asbestos liquid to give it the appearance of the genuine article. Again, many of the so-called fireproof city buildings are fireproof as regards the shell of the building only, but since the interior is inflammable they become absolute furnaces when a fire is started.

TRADE NOTES.

THE Crompton Road schools, Macclesfield, are being supplied with Shorland's warm air ventilating patent Manchester grates and patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

ST. MARY'S CHURCH, Oatlands Park, Surrey, will shortly possess a new ring of eight bells (tenor 12 cwt.). The bells in question are those which were used for the "Festival of Empire," Crystal Palace, and these were booked by the church authorities subject to their ability to raise the necessary funds. The work is to be carried out by Messrs. John Warner & Sons, of "The Spitalfields Foundry," London.

THE Dundee Corporation Electricity Committee recommend an immediate expenditure of £49,000 on extensions.

THE Newton Urban Council have under consideration a scheme for the erection of swimming baths at a cost of £2,800.

THE Aberdeen Town Council on Monday adopted a recommendation of their Water Committee that the water reservoirs at Mannofield and Cattofield should be covered. The cost is estimated at £25,385.

THE Government of the Union of South Africa are spending £4,000,000 for railway works, £450,000 for rolling stock; also £600,000 on public works and buildings and £370,000 on telegraphs and telephones.

THE new road from the tram terminus at Southchurch, Southend-on-Sea, to Thorpe Bay is shortly to be commenced. The roadway will be 100 feet in width and about three miles in length.

THE University of Toronto, Canada, will erect a new building for a gymnasium, dining hall, reading and billiard rooms, &c., at an estimated cost of \$1,150,000 (about £236,000).

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

CHESHIRE.

Clatterbridge.—Workhouse extension (£3,000).

Hyde.—Public Hall, Police Courts, Offices, &c., in Corporation, Water and Greenfield Streets. Mr. J. Diggle, A.M.I.C.E., borough surveyor.

Macclesfield.—Workhouse: alterations to receiving wards. Messrs. Whittaker & Bradburn, architects.

CORNWALL.

Crantock.—Houses for Miss Stephens.

Fraddon.—Houses for Mr. J. Bullock.

Perranporth.—Royal Cornwall Infirmary: female convalescents' home (£6,500).

CUMBERLAND.

Threlkeld.—Church Schools.

DEVON.

Newton Abbot.—Public Baths (£2,800).

G.W.R. Station.

DORSET.

Lyne Regis.—Eight Council cottages, Lower Early Mead Field.

Swanage.—Dairy, stables, &c. Messrs. Parsons & Hayter, architects.

House, Victoria Avenue and Northbrook Road, for Mr. F. Smith.

Four houses, Ancaster Road, for Mr. J. S. Date.

School. Messrs. Hart & Waterhouse (of London), architects.

DURHAM.

Craghead.—Twenty houses Mr. J. W. Rounthwaite, A.R.I.B.A. (of Newcastle-on-Tyne), architect.

GLOUCESTERSHIRE.

Cheltenham.—Workhouse Infirmary extensions (£800).

HEREFORDSHIRE.

Colwall.—Six Council cottages.

Cottage, Camp End, for Mrs. Buck.

Hereford.—Art School, Castle Green: alterations.

ISLE OF MAN.

Sulby.—Wesleyan Chapel. Mr. J. E. Teare (of Douglas), architect.

KENT.

Ashford.—Technical Institute, Elwick Road (£6,500).

Borough Green and Wrotham.—Council School improvements (£11,400).

Dartford.—Grammar School extension.

Gravesend.—Hospital extension. Mr. W. M. Dean, A.R.I.B.A., architect.

Margate.—Swimming Bath, Garden Row, for Mr. W. Leach Lewis.

Sheerness.—Higher Elementary School improvements (£500).

Tonbridge.—Council School, Sussex Road: improvements (£600).

Wrotham.—(See Borough Green.)

LANCASHIRE.

Colne.—Three cotton sheds for 4,000 looms, in the districts of Carrheys, Greenfield and North Valley Road.

Hendon.—Cotton shed for 1,200 looms.

Liverpool.—Workhouse Mortuary, Brownlow Hill. Mr. T. W. Haigh, architect.

Nelson.—Extension of Bankfield Mill, for the Westwood Manufacturing Co.

Radcliffe.—Hampson Mission School.

Wirral.—Workhouse extensions (£3,000).

LINCOLNSHIRE.

Bourne.—Isolation hospital for twenty-two beds (£4,850).

Louth.—Public Baths.

Skegness.—Two bungalows for Mr. H. Lill.

Stables for the Skegness Co-operative Society.

Villa for Mrs. L. J. Whiting.

MIDDLESEX.

Hendon.—Parish Church enlargement (£6,000).

MONMOUTHSHIRE.

Bedwas.—Twenty-six (or more) houses, for the Grove Building Club. Mr. G. L. Rees, architect.

Elanilleth.—Thirty-seven houses. (Apply Mr. C. T. Evans, Central Hotel.)

Tredegar.—Twenty-six houses, Park View, for the Cwm-rhos Building Club. Messrs. Harris & Son (of Bargoed and Tredegar), architects.

NORTHAMPTONSHIRE.

Kettering.—Art Gallery (£3,000).

NORTHUMBERLAND.

Morpeth.—Workmen's dwellings (£5,800).

NOTTINGHAMSHIRE.

East Markham.—Parish Hall (£600).

SOMERSET.

Taunton.—Swimming Bath (£3,000).

STAFFORDSHIRE.

Blowich.—Public Baths.

SUSSEX.

Coleman's Hatch.—Church, Shepherd's Hill.

Crawley.—Council School for 450 places.

Horsham.—Secondary school (Pupil Teachers' Centre). £1,750.

Lower Beeding Colgate.—Council School.

WORCESTERSHIRE.

Bournville.—Anglican Church, Vicarage, and Parish Hall (£10,000).

Pershore.—Two cottage homes, Defford Road, for the Board of Guardians.

YORKSHIRE.

Penistone.—Public Offices and Hall, Shrewsbury Road (£3,500).

Robin's Hood Bay.—House: Mr. H. P. Hopkins, architect; also

Warehouse for Mr. W. A. Smith.

Scarborough.—Roman Catholic Church, Avenue Victoria, South Cliff (accommodation for 350 people). £2,500.

Sheffield.—Public Elementary School for 600 places, Maltby Street and Walkland Road.

Thirsk.—Constitutional Club.

Wetherby.—District Council offices and depot (£1,120).

WALES.

Bettws and Blaenyrwch.—Council Schools.

Cardiff.—Chapel, Pomeroy Street, for the Trustees of the Mount Stuart Welsh Congregational Church.

Messrs. James & Morgan, F.F.R.I.B.A., architects.

Technical Institute (£40,000).

Llanidloes.—Workmen's dwellings.

Onllwyn (near).—C.M. Chapel, Banwen. Mr. J. S. Griffiths (of Neath), architect.

Pontlliw.—Council School.

Swansea.—Exchange buildings, Adelaide Street and Cambrian Place. Mr. C. T. Ruthen, architect.

Trebanos.—Council Mixed School.

SCOTLAND.

Clarkston.—Double cottage, Overlee, for Mr. J. Merry.

Giffnock.—Forty-four terrace houses, Busby Road, for Mr. M. Dickie.

Double Villa, Eastwood Avenue, for Mr. J. Taylor.

Glasgow.—Statute Labour Department buildings, Rutherglen Road.

Public Baths and Wash-houses, Garngad.

Double villa, Campsie Road, Hillpark, for Messrs.

Eadie & Sons.

Eight terrace houses, Third Avenue, King's Park, for Mr. M. Dickie.

Motor garage, Dunstaffnage, Newlands, for Mr. D. Borland.

Villa, Davieland Road, Whitecraigs, for Mr. A. Blackwood.

Greenock.—Two double-flatted villas, Denholm Street, for Messrs. R. & M. Kirkwood.

Westburn Sugar Refineries, Ltd.: extension of works, Drumfrochar Road.

Inverkeithing.—Board School (£25,000).

Kinloch-Rannoch.—U.F. Church manse (£500).

Kirkconnel.—Drill Hall for the Territorials. Mr. J. Young (of Sanquhar), contractor (£1,000).

Muirhead.—Board School. Messrs. Thoms & Wilkie, F.F.R.I.B.A. (of Dundee), architects. Separate trade contracts.

Scotstoun.—Nine terrace houses, Norse Road, for the Scotstoun Estate Building Co.; also

Fourteen terrace houses, Stuart Avenue.

Halls, Station Road, Scotstoun West, for Messrs. Henderson & McDonald.

Uplawmoor.—Cottage for Mr. G. L. Kerr.

IRELAND.

Cornelscourt (Co. Dublin).—National Schools. Messrs. Orpen (F.R.I.B.A.) & Dickinson, M.R.I.A.I. (of Dublin), architects.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 16,483. July 18, 1911.—Improvements in sash fasteners. F. G. Hallet, 65 Jeffcock Road, Wolverhampton. This invention has reference to fasteners as used in sliding windows, particularly adapted for high sashes as used in schools, public buildings, and the like, being readily locked and unlocked by means of a shaped pole known to the trade as a rod hook. Fig. 1 is an elevation of the catchpiece. Fig. 5 is a perspective view of the clutch. Fig. 9 shows the fastener assembled together, and in a locked position. Fig. 10 shows the fastener in an unlocked position. A is horizontally pivoted upon B, carried by the meeting rail of the lower sash, and is so weighted as to normally fall into position for N to engage with D. By applying a rod hook or by any

FIG 1

FIG 5

upward pressure under C or through X, the hook N is withdrawn from its normal position. D is securely fixed to the meeting rail of the upper sash, so that N engages with D, but in such a manner as to admit of the sashes being opened from the inside or outside by raising the lower sash or pulling down the top sash. To prevent this, and to make the fastener to lock and unlock from the inside only, E is also pivoted on one side of B, co-adjacent with G. The axis of E is preferably below that of A. The end F comes when A is in its normal position behind G, and locks A to resist upward pressure when applied through X or under C. A is provided with a stud, H, to limit the forward action of A, and also in order that when E has been operated and the

FIG 9

FIG 10

fastener is in an unlocked position H will come upon the top side of E near its backward end, and press F against K. Thus E, being prevented from turning, prevents A also from returning to its normal or locked position. The rod hook first presses against the lower curved edge of the backward end of E, thus freeing F from G, raises E until the finger of the pole comes in contact with C. Further upward pressure raises A, and draws N from D; the further upward pressure of rod hook continues to turn A until at a certain point H passes clear of the rear end of E (owing to the relative position of the respective pivot centres of A and E), whereupon the underside of the rear end of E falls upon a shoulder. The finger of the pole being withdrawn, A falls back until H bears upon top side of E, and A is retained in its unfastened position; that is to say, with the projection N clear of D. A stop, M, is provided on catchpiece A which, by bearing against B, limits the degree to which A can be turned when unfastening it. May 2, 1912.

PATENT SPECIFICATIONS PUBLISHED
AUGUST 15, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 16,774. July 21, 1911.—J. C. Thompson, Chilton House, Rosherville. Cocks or valves.

16,873. July 22, 1911.—K. H. A. Eckstein, 43 Steinerstr., Altona, Germany, and F. J. Poets, 2a Boersenbruecke, Hamburg. Safety locks.

16,947. July 24, 1911.—Date claimed under International Convention July 29, 1910. Ernst Gronau, Strassburg,

Elsass, Germany. Wall structure for liquid containing vessels.

16,984. July 25, 1911.—Ernest Delille, Montigny-en-Gohelle, France. Process of manufacturing light constructions of reinforced concrete.

17,032. July 25, 1911.—H. N. Davis, The Diamond Foundry, Luton, and W. R. Twigg, Woolverston, Westbourne Road, Luton, Beds. Gas fires.

17,048. July 25, 1911.—R. B. Lucas, Shillington Manor, Hitchin. Method of getting clay, chalk and the like.

18,341. Aug. 14, 1911.—A. F. Jenkins, 507 West Lombard Street, Baltimore, Maryland, U.S. Acetylene gas generating systems.

19,399. Aug. 31, 1911.—Thomas Coleman, Alfreton Road, Derby. Treating stone or other materials for making roads.

19,974. Sept. 7, 1911.—L. Van den Driessche, 222 rue Masui prolongee, Brussels. Gas stoves.

20,351. Sept. 14, 1911.—J. A. Getty, 137 Tressillian Road, Brockley, S.E. Kitchen ranges.

20,704. Sept. 19, 1911.—J. S. Deacon, 4 Seymour Avenue, and F. V. Woodford, 128 Thackeray Avenue, Tottenham. Means for enabling objects to be attached to ferro-concrete buildings.

21,168. Sept. 25, 1911.—J. Y. MacAlister, Northwick House, St. John's Wood Road, Middlesex. Electrical plug switches.

22,089. Oct. 7, 1911.—F. W. Pinson, Dale Works, Dimmingsdale, Willenhall, Staffs. Padlocks.

23,642. Oct. 26, 1911.—Joseph Anderson, 5 Sutherland Street, Pimlico, S.W. Window holders for sliding sashes.

24,271. Nov. 1, 1911.—B. S. Weston, 5 Parkholme Road, Dalston. Means for straightening walls which are out of the perpendicular.

24,775. Nov. 7, 1911.—Date claimed under International Convention Nov. 21, 1910. A. A. Poulsen, Lemvig, Denmark. Process for producing an improved cement.

16,983. July 24, 1911.—G. A. C. Thynne and Thomas Pulling, Victoria Tile Works, Hereford. Improved brick for building kilns and ovens.

25,781. Nov. 18, 1911.—Ernest Mireau, 380 Adelaide Street West, Toronto, Canada. Heat concentrating and retaining device for use with gas stoves and like burners.

26,073. Nov. 22, 1911.—The Yorkshire Hennebique Contracting Co., Ltd., and G. W. Crawshaw, Viaduct Works, Kirkstall Road, Leeds. Helmets for use in the driving of reinforced concrete piles.

28,826. Dec. 21, 1911.—R. A. E. Brooks, 111 Priory Park Road, Kilburn, N.W. Gas bracket for heating, cooking and like purposes.

280. Jan. 3, 1912.—Solomon Barnes, 189 St. James Street, Montreal. Sand mixers and coolers.

2,334. Jan. 29, 1912.—S. T. Muhlhausen, 5 Hallessches Ufer, Berlin, S.W. Rolled up lattice shutters and the like.

3,109. Feb. 7, 1912.—Sozont Sandurskyj, 6 Tempelgasse, Vienna. Self-guide arrangements for parallel rulers.

4,148. Feb. 19, 1912.—John Radcliffe, "Maro," Capel Road, East Barnet, Herts. Improved compositions applicable for making and repairing roads.

4,406. Feb. 21, 1912.—Ozonair, Ltd., and E. L. Joseph, 96 Victoria Street, S.W. Mechanical filtration of water.

5,986. Oct. 5, 1911.—The Copeman Electric Stove Co., Flint, Michigan. Electrically heated ovens.

6,980. March 21, 1912.—R. H. Neal, A.M.I.C.E., M.I.M.E., 4 Mortimer Road, West Ealing. Interlocking concrete slabs or blocks for use in building concrete walls, sheet piling, groins, and other structures.

7,597. March 28, 1912.—Date claimed under International Convention March 30, 1911. Eugen Gerber and Felix Cusi, Colmar, Elsass, Germany. Key with movable wards.

7,883. April 1, 1912.—E. E. Barnard, Lynchburg, Campbell, Virginia, U.S. Attachments for drawing boards.

8,437. April 9, 1912.—W. A. Fraser, Georgetown, Halton, Ontario. Flushing cisterns for water closets, and any disinfecting means therefor.

8,530. April 24, 1911.—Mackintosh Hutchinson, 398 Queen Street, East Toronto, Canada. Sawing machines.

9,060. April 17, 1912.—Rheinische Buntpapierfabrik, G.M.B.H., Erkrath-Dusseldorf. Coloured transparencies or imitations of stained glass.

9,642. April 23, 1912.—S. L. Braun, 19 rue du Regent, Antwerp, Belgium. Glass cutter.

9,649. April 23, 1912.—Date claimed under International Convention May 17, 1911. W. E. Suess, of Taylor, William-son, Texas. Stop cocks.

9,744. April 24, 1912.—Luckenbach Inventions Development Co., 144 West Thirty-seventh Street, New York. Apparatus for mixing and distributing liquid bodies (paint).

9,758. April 24, 1912.—H. J. Rand, 1122 Osage Avenue, Kansas, U.S., architect. System of house drainage.

10,196. April 30, 1912.—Edward Bignell, Lincoln, Nebraska, U.S. Concrete piling.

— FIRE PROTECTION FOR NATIONAL AND UNIVERSAL EXHIBITIONS.*

THE primary principles of safety for exhibitions should practically be identical for all countries, the local conditions having but comparatively little effect on these enterprises. There are, however, but few codes of regulations existent in different countries, owing to the fact that exhibitions requiring buildings of a peculiar sort are generally classed in local by-laws as exceptional enterprises for which rules are to be issued to meet each individual case, and the necessary supervision is mostly left entirely to the discretion of the administrative officials.

The code here suggested might be easily applied to any exhibition, national or international, be it held in St. Petersburg, in Berlin, London, Paris, Rome, or Vienna.

Of course, an exhibition building could be made as safe practically as a perfectly devised theatre, but this would not be practicable from a financial point of view, for large exhibitions must always be conducted in what are essentially temporary structures that have to be erected at a minimum cost, compatible with utility and safety. Impracticable and expensive requirements cannot be formulated unless exhibitions are to be handicapped to such an extent that they cease to exist. But a practical minimum of useful requirements in the interests of the safety of the public, and also in the interest of such exhibits as are of particular historical or artistic value, should be formulated, and, be the exhibition a national one or an international one, the same safeguards practically hold good for the visiting public and the exhibitors.

In organising an exhibition the following should be observed from the fire point of view:—

LOCATION OF AN EXHIBITION.

1. *General Position.*—The position of the grounds should not be unduly exposed to gales, winds, &c.
2. *Accessibility.*—The exhibition grounds should be easily accessible from not less than two sides.
3. *Levels.*—The levels should be such that the gradients on the main roadways of the exhibition ground are easily drivable.
4. *Natural Water Supply.*—The position should be preferably on or near some natural source of water supply, such as a river or lake.

PRIMARY PRECAUTIONARY FEATURES.

5. *Extent of Fire.*—The primary precautionary feature for reducing the extent of the fire risk should be that of the isolation of buildings or blocks of buildings, and the subdivision of large buildings into parts, and their construction with due regard to the relative importance of the fire risk.
6. *Loss of Life.*—The primary precautionary feature for reducing the risk of loss of life should be the provision of exits in such a manner that the maximum distance from any point in the interior of an exhibition building to the open shall be, say, 80 feet, that two routes of exit shall be available, and that the exits be clearly indicated.
7. *Causes of Fire.*—The primary precautionary feature for reducing the risk of outbreak of fire should be the limitation of and control of the use of open lights and fires, smoking; the lighting, power and heating services and the use and storage of explosives, oils, spirits, and other highly inflammable objects.
8. *Control Service.*—The primary principle for obtaining an observance of the preventive requirements should be a reliable control service placed in responsible hands, with (a) an inspection service, and (b) a watching service.
9. *Fire Service.*—The primary principles for obtaining effective assistance for combating an outbreak of fire should be:—
 - (a) An extensive well-indicated fire-call system.
 - (b) A private well-trained fire service to be rendered by the watching service above named.
 - (c) A well-organised section of the public fire service

* Abstract of a Paper by Mr. Edwin O. Sachs, F.R.S.Ed., Chairman of the British Fire Prevention Committee, Vice-President Int. Fire Service Council, &c., presented at the International Fire Congress, St. Petersburg.

(divided into self-contained units of not less than, say, eight men per unit) with motor appliances, a unit to be within not more than, say, 1,000 yards distance from any point in the exhibition.

(d) A reliable system of rapidly obtaining additional effective assistance from the public fire service.

(e) A well-distributed and clearly indicated supply of first-aid appliances within, say, 100 feet from any point inside an exhibition building or 200 feet without.

(f) A water supply from two independent sources (one preferably natural) and a well-distributed hydrant system.

(g) Co-operation of the public fire service with the local police, military and ambulance services, and with the technical staff of the exhibition.

Mr. Sachs devoted the remainder of his paper to an elaboration of clauses 5-9. From it we take the following:—

SIZE AND SEPARATION OF BUILDINGS.

10. *Maximum Cubic Contents of Buildings.*—The cubic contents of buildings should be limited as follows, namely:

(a) No one building to exceed, say, 5,000,000 cubic feet.

(b) No one part of any building to exceed 1,000,000 cubic feet unless separated from the adjoining part by a wall of "partial" fire resistance, the openings in which are suitably fitted with doors or shutters.

11. *Separation of Buildings.*—The buildings should be separated on the following lines:—

(a) All buildings of more than 1,000,000 cubic feet should be at least 60 feet distant from any other such building.

(b) Buildings of 500,000 cubic feet upwards should be at least 40 feet away from any other building.

(c) It should be permissible for booths, small structures, &c., of under 100,000 cubic feet to be connected up or adjoin without being separated by walls of "partial" fire resistance if the total cubic extent of these adjoining buildings in any one block does not exceed 500,000 cubic feet and such blocks are not less than 40 feet away from any other such block or building, but this condition should not be applicable to any building used for side-shows, theatrical purposes or a restaurant having a seating capacity of over 300 people.

(d) Small structures, booths, &c., of under 100,000 cubic feet must be not less than 20 feet away from any other building of any description, unless forming part of a block of 500,000 cubic feet.

(e) Where a building contains irreplaceable works of art or historical exhibits, or where it contains administrative offices, a post office, telegraph or telephone office, a police or fire station, the distance from any other building should not be less than double the distance named above, but preferably more.

12. *Connecting up of Buildings by Covered Ways.*—It shall be permissible to join up any three buildings of 3,000,000 to 5,000,000 cubic feet, or any five buildings of 1,000,000 to 3,000,000 cubic feet, or any equivalent of buildings to the extent of 15,000,000 cubic feet, by suitable corridors or covered ways, known as connecting links, on the following conditions:—

(a) That the distance between the buildings to be linked up be as aforesaid (see Clause 11).

(b) That the section of the connecting link shall not exceed 1,000 square feet, with a minimum height of 20 feet.

(c) That the material used for the connecting link shall throughout be of a "partial" fire-resisting character excepting only the glazing.

(d) That it shall be possible to rapidly (i.e. within, say, 60 seconds) open up a drivable opening by doors or shutters at right angles to the connecting link, the opening to have slopes so as to make the way thus formed drivable.

(e) That no draperies or furnishings of an inflammable character be used within or on the connecting link.

(f) That the doors from the building into the connecting links be of a "partial fire-resisting" character.

(g) That no two such connecting links parallel or approximately parallel to one another shall be closer together than 200 feet centre to centre.

(h) That not more than four connecting links run serially either parallel or longitudinally.

(i) That where a building contains seating accommodation for more than 300 people and is used for restaurant, theatrical or side-show purposes, it shall not be connected up with any other building.

NUMBER OF FLOORS IN BUILDINGS.

13. *Floors.*—The number of floors permissible in individual buildings should be determined on the following lines:

A. *Ground Floor.*—No building should have a ground floor more than 4 feet above the external ground level at or near its main entrance.

B. First Floor.—No building should have a first floor available to the public except on the following conditions:—

(a) That in buildings of over 500,000 cubic feet the first floor be in the form of a gallery only, of not greater than one-third the superficial area of the ground floor, which gallery must have ample staircases of easy rise and tread at each extreme end or corner.

(b) That in buildings of under 500,000 cubic feet if complete first floors be applied, the same conditions as to staircases be compulsory, and that there be numerous suitable external casement windows, each of at least 8 square feet area to at least two fronts.

(c) That no first floor shall be higher than 30 feet above the ground floor.

C. Second Floor.—No building shall have a second floor available to the public, or any higher floor over any part of a building accessible to the public.

D. Basement.—No building used by the public shall have a basement or cellar unless the cellar have an external approach only, and be separated from the rest of the building by fire-resisting construction affording "partial protection."

(To be continued.)

COVENTRY MUNICIPAL BUILDINGS.

A LOCAL GOVERNMENT BOARD inquiry was held at Coventry on Thursday, last week, respecting the application by the Corporation for a loan of £67,000 for the erection of municipal buildings. The Inspector appointed was Mr. R. G. Hetherington, A.M.Inst., C.E. The Corporation was represented by the Town Clerk (Mr. G. Sutton) and the architects, Messrs. Garrett, Semister, Buckland & Farmer, of Birmingham, whose plans have been accepted, by Mr. E. Garrett and Mr. H. T. Buckland.

The Town Clerk pressed for the longest possible period of repayment on account of the permanent and substantial character of the buildings.

The Inspector replied he thought the limit was sixty years, but he would recommend the longest period the Board would grant.

Giving particulars of the proposed buildings, the Town Clerk said the scheme had been submitted to open competition, and about 160 architects took part. The assessor was Mr. Guy Dawber, F.R.I.B.A., and he was of opinion that the selected design could be carried out for £50,000. Some alterations were subsequently made in the plans and also owing to increased cost of labour and materials, the lowest of twenty-two tenders received was £60,375. The tenders were remarkably close, ranging from £60,000 to £64,000 with one or two exceptions. The tender provisionally accepted, subject to the loan being sanctioned, was that of Messrs. Wilcox & Co., Wolverhampton. As to the need for the municipal buildings a good deal could be said. At present all the officials were dotted about in various places.

The Inspector intimated he would go round and have a look at the present office accommodation.

It was also pointed out to the Inspector that the Corporation had just taken over the tramways, and that office accommodation would be required for this department; also that the City Council had to meet in St. Mary's Hall, where the accommodation had to be specially arranged every time the Council met. The scheme provided for a Council Chamber and committee rooms. There had been a scheme before the Local Government Board in 1907, which included shops on the ground floor, but on the advice of the Board this was abandoned, and the interval had been spent in getting the City Council resolved upon one definite idea.

There was no opposition, and the inquiry was closed.

VARIETIES.

MESSRS. WILLIAM SPROWSON & SON, of Constantinople, have been appointed architects for the first three principal exchanges of the Constantinople telephone system, the exchanges being stationed in Stamboul, Pera, and Kadikuey.

THE Mersey Docks and Harbour Board are about to reconstruct the dock wall at the south end of the west side of the Salthouse Dock, and to erect a shed on the quay, at a total estimated cost of £8,630.

MESSRS. TAYLOR & WALLIN, engineers, Newcastle and Birmingham, have been instructed by the Brampton Rural District Council to prepare a scheme of sewerage and sewage disposal for the village of Castle Carrock. This is the third scheme which the Brampton Council have entrusted to this firm.

MR. W. PARKINSON, headmaster of the Shipley Art School, has been appointed headmaster of the Burnley School of Art, vacant by the death of Mr. W. H. Hey. The salary is £250, rising to £300 a year. There were thirty-nine applicants.

MR. F. L. STANFORD, Local Government Board Inspector, held an inquiry at Boston, last week, into the application of the Town Council for sanction to borrow a loan of £7,370 for the rebuilding of the Town Bridge. There was no opposition.

MR. H. M. WHITEHEAD, engineer, of Cannock, has been instructed by the Audley Urban District Council to prepare a scheme for dealing with the sewage in the Council's area. The cost is expected to be about £15,000.

THE statistics of Public Education issued last week show that schools of art which were recognised numbered 218 in England, with 41,292 students, and in Wales 5, with 986 students. Evening and similar schools in England totalled 7,422, with 584,382 students, and in Wales 742, with 43,799 students.

THE Dublin Industrial Development Association considered at their last meeting the fact that at the present time there was a considerable importation of coloured marble into Ireland, and it was decided to urge upon the public the desirability of using the native material in preference, as very fine coloured marble is obtainable in this country.

AN inquiry was held on the 14th inst. by the Local Government Board into an application by the Fylde Water Board, which is constituted of Blackpool, Fleetwood, Lytham, and St. Anne's authorities, for a loan of £120,000 for the completion of the Grizedale Reservoir. It was pointed out that the population to be supplied was over 136,000, but during the busy week in August there was a temporary population of about half a million.

THE death has occurred at Fircliffe, near Matlock, of Mr. Charles Edward Dawson, one of the best known Derbyshire architects. Mr. Dawson was associated with the Sir Joseph and Lady Whitworth Hospital Trust, and was a member of the Darley District Council. He was a son of the Mr. Joseph Dawson who worked with Sir Joseph Paxton, the designer of Chatsworth and the Crystal Palace.

A CONFERENCE of building trade delegates has been convened to take place in Essex Hall, London, on October 21. The subject to be considered is the proposed amalgamation of all the unions in the building trade. Voting is now in progress, and is to be completed and sent to the Parliamentary Committee by Monday, September 30. It is proposed to call the new organisation the Amalgamated Building Workers' Union. The object is to unite the building trade unions, to maintain a fighting organisation, to take action nationally and internationally on the ground that the interests of all wage workers are identical, and to organise by industries as workers, instead of by sections as craftsmen, for trade purposes. There will be a uniform scale of contributions and benefits.

THE available cash balance in the funds of the Amalgamated Society of Carpenters and Joiners amounts to £84,846 8s. 3d. A year ago the amount stood at £100,766 12s. 7d. The Parliamentary Labour Representation Fund has also been reduced to £502 0s. 2d. The Executive Council declare that if their repeated appeals for support to this fund continue to be ignored, and they have to efface themselves as an organisation, the responsibility will rest upon the members. The election of Executive Councilmen for the Society is officially announced as follows:—Districts No. 1 to 11: Messrs. J. L. Wright, Glasgow; G. Scott, Leith; A. Gould, Hull; A. E. Andrews, Bolton; W. P. Dobson, Liverpool; F. Chew, Aston; E. H. Jarvis, Bristol; W. Barnes, Clapham; T. M'Partlin, Dublin; H. Crampton, Chicago; and A. G. Sanders, Toronto.

A WHITE Paper issued last week shows that from the passing of the Housing of the Working Classes Act in 1890 up to December 1905 eight loans to the amount of £10,300 for the erection of dwellings were sanctioned to five rural district councils. From January 1, 1906, to July 31 last forty-eight loans were sanctioned, amounting to £95,646 in respect of thirty-seven parishes. Another White Paper dealing with labourers' cottages in Ireland built under the Labourers Act shows that since the passing of the Act in 1883, 39,241 houses have been built, and 3,439 are building. Loans have been sanctioned amounting to £7,906,237, and the amount required to be raised annually in repayment was £242,250. The amount of the Exchequer contribution for the year ended March last was £30,811, and the amount of rent received from tenants of cottages and plots during the same period was £107,682.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

Huddersfield.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield. See Notice on page 126. (Competition News).

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelly.

CONTRACTS OPEN.

ANDOVER.—Sept. 21.—For the construction of the following works, for the Corporation: Screen chamber, engine house, suction tank, 9-in. rising main, settling tank, holding-up tank, four circular bacteria beds, alterations and additions to existing storm-water tank, erection of cottage, and other works. Deposit £5. Messrs. J. Taylor, Sons & Santo Crimp, civil engineers, Caxton House, Westminster, S.W.

ARDSLEY.—Sept. 5.—The West Riding Highways Committee invite whole or part tenders for the following works to Hoyle Mill Bridge, over the River Dearne, in the urban district of Ardsley, near Barnsley—viz.: (1) Masonry and general works; (2) reinforced concrete construction. Mr. F. G. Carpenter, West Riding surveyor, County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

BEXHILL-ON-SEA.—Sept. 21.—For the reinstatement of the wall to the gardens, and storm-water duct—the whole to be

in concrete, supported by six mild steel stanchions—for the Proprietors of the Kursaal. Deposit 10s. Mr. L. Burn, A.M.I.M.E., consulting engineer, 6 Holborn Viaduct, London, E.C.

BLACKBURN.—Sept. 23.—For erection of new public halls on Blakey Moor (sub-structure section), for the Corporation. Send applications and £1 1s. deposit to Messrs. Briggs, Wolstenholme & Thornely, and Messrs. Stones, Stones & Atkinson, joint architects, Richmond Terrace, Blackburn.

BOLTON-ON-DEARNE.—Sept. 6.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with Bolton-on-Deerne new school—viz., builder, joiner, slater, plumber, plasterer, painter, ironfounder and smith, and asphalter. The Education Architect, County Hall, Wakefield, and the Divisional Clerk's Office, Mexborough. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

STROUD.—Sept. 3.—For carrying out alterations at Roxburgh House, for the Guardians. Mr. G. P. Milnes, 7 Rowcroft, Stroud.

SULBY.—Sept. 10.—For erection of a new chapel, for the Trustees of Sulby Wesleyan Chapel. Mr. J. E. Teare, Athol Street, Douglas.

TOWCESTER.—Sept. 14.—For erection of seventeen houses, for the Rural District Council. Messrs. Jackson Stops & Co., architects, Town Hall, Towcester.

WALES.—Sept. 3.—For erection of girls' school and domestic subjects blocks at Troedryhiw, for the Merthyr Tydfil Education Committee. The Borough Architect, Town Hall, Merthyr Tydfil.

WALES.—Sept. 4.—For erection of twenty-eight or more houses on the estate of Mr. J. Davies, deceased, Bedwas, for the Grove Building Club, Bedwas. Mr. G. L. Rees, architect and surveyor, Tydfil Road, Bedwas.

WALES.—Sept. 9.—For the construction steelwork required in the extension of their works at Lower Penarth, near Cardiff, for the South Wales Portland Cement and Lime Co., Ltd. Mr. J. W. Rodger, architect, 14 High Street, Cardiff.

WORSTHORNE.—Sept. 11.—For erection of a temporary elementary school for 120 children at Worsthorne, near Burnley, for the Lancashire Education Committee. Builders' work consists of the foundations of the school buildings and the whole of the latrines, drains, fencing, and playground forming. Deposit £2. Mr. H. Littler, county architect, 16 Ribblesdale Place, Preston.

TENDERS.

BINGLEY.

For the works required in alteration to and the construction of a new assembly hall in the central stores, for the Co-operative Society. Messrs. NUNNS & BRACEWELL, architects, Bingley.

Accepted tenders.

Parsons & Co., Bradford, iron and steel work	£1,030	0	0

RANGOON MUNICIPAL BUILDINGS COMPETITION.

INTENDING competitors in the above competition are informed that the assessor is an Associate of the Royal Institute of British Architects, and is Consulting Architect for the Government of Burma. The duties of the assessor will be in accordance with Clause 2 of the regulations of the R.I.B.A. for architectural competitions.

The selected architect will have undivided responsibility for the carrying out of the work. The duties mentioned in Clauses 22, 24 and 25 of the competition conditions have been modified, and the duties of the selected architect will be those specified in the R.I.B.A. schedule of professional charges. Clause No. 4 of the conditions has been modified, and payment of the commission will be in accordance with the R.I.B.A. schedule of professional charges. The plan numbered "6" in Clause 19 of the conditions may be omitted by competitors.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

CHESHIRE.

- Birkenhead*.—Primitive Methodist Church, New Chester Road, New Ferry.
Chester.—King Edward VII. Memorial wings to the General Infirmary.
Macclesfield.—Council School, Church Street, Hurdfield: improvements (£1,000).
 St. George's School, High Street: alterations and improvements. Messrs. Whittaker & Bradburn, architects (£3,000).

CORNWALL.

- Redruth*.—Drill Hall. Mr. T. Knight, contractor.

DERBYSHIRE.

- Burton-on-Trent*.—Workhouse Children's Home.
Derby.—Union Workhouse: boiler house alterations, &c. Mr. F. C. Coulthurst, architect.
Hope (near Sheffield).—Council School. Mr. G. H. Widows, A.R.I.B.A. (of Derby), architect.

DEVON.

- Exmouth*.—Drill Hall, &c., for the 4th Wessex Brigade, R.F.A., of the Territorial Force Association. Messrs. Ellis, Son & Bowden (of Exeter), architects.

DORSET.

- Poole*.—Alderney Isolation Hospital: additions and alterations. Mr. S. Newman, F.R.I.B.A., Borough surveyor.

DURHAM.

- Hartlepool*.—Workhouse extensions. Mr. F. W. Turner, architect.
South Shields.—High School for boys: gymnasium and handicrafts department (£500).

HAMPSHIRE.

- Totton*.—Police Station: additions and alterations (£900).

KENT.

- Faversham*.—Baptist Church: vestries, class-rooms, &c. (£800 to £900.) Messrs. Ratcliff Brothers, contractors.
Hollingbourne.—Union Workhouse: boiler house, &c. Mr. E. A. Gardner (of Maidstone), engineer.

LANCASHIRE.

- Worsthorne*.—Temporary Elementary School for 120 places. Mr. H. Littler (of Preston), County architect.

LINCOLNSHIRE.

- Donington*.—Working-class dwellings (£1,100).
Grimsby.—Council School, Victoria Street. Mr. H. C. Scaping, architect.
Lincoln.—No. 260 High Street: alterations. Mr. K. S. Bayne (of Bracebridge), architect.

MIDDLESEX.

- Hounslow*.—Congregational Church Hall and Institute, Douglas Road. Mr. W. Tout (of Hendon), contractor (£4,450).
Isleworth.—Mission Church. (Apply Rev. W. M. Rapson.)
 St. John's Church Hall.

NORFOLK.

- Caister-on-Sea*.—Conservative Hall, Tan Lane.
Hanworth.—Church restoration (£600).

NORTHAMPTONSHIRE.

- Northampton*.—Premises, New Street: alterations for Mr. J. W. North.
Towcester.—Seventeen Council houses. Messrs. Jackson, Stops & Co., architects.

NOTTINGHAMSHIRE.

- Retford*.—Isolation Hospital.
Worksop.—Priory Church restoration (£12,000).

STAFFORDSHIRE.

- Wolverhampton*.—Metropolitan Bank premises, High Street: re-building.

SUFFOLK.

- Bungay*.—Six working-class dwellings for the Town Feoffee.
Southwold.—Catholic Church.

SURREY.

- Camberley*.—Wesleyan Methodist Church. Mr. W. W. King, contractor.
Leatherhead.—London County and Westminster Bank premises, Swan Corner. Mr. W. H. Brown, contractor.

WORCESTERSHIRE.

- Broadway*.—Sixty working-class cottages (£10,000).
Knightwick.—Sanatorium enlargement.

YORKSHIRE.

- Gisburn*.—Council School. Education Architect, Wakefield.
Newhall (Sheffield).—Eyre Memorial Church.

WALES.

- Aberavon*.—Cottage and accidents hospital (£2,500).
Builth Wells.—Fire Engine Station, &c. Mr. T. Smith, Council surveyor.
Caerphilly.—Four pairs of semi-detached houses on the Fairfield Estate, for the Caerphilly Co-operative Garden Village Society, Ltd.
Glyncorrwg.—Three shops and coachhouse, Cwmmwr. Mr. P. J. Thomas (of Bridgend), architect.
Llanelly.—Council Schools for 1,000 places, and Domestic Subjects Centre, Stebon Heath Terrace.

SCOTLAND.

- Coatbridge*.—Board School, Drumpellier Street, for 700 places (£7,200).
Drunlembie.—Drill Hall for the Argyll and Sutherland Highlanders. Mr. D. Hamilton, contractor.
Dundee.—Electric Sub-station.
Falkirk.—Bakery, Dalderse Avenue, for the Bainsford and Grahamston Co-operative Bakery Society.
Glasgow.—Training College, Jordanhill.
Guardbridge.—Paper Works extension (£50,000).
 Bakery extension, for the Co-operative Society.
 Workmen's houses, for the Co-operative Society.
Motherwell.—High School.

IRELAND.

- Bray*.—Working-men's dwellings (£10,000).
Roscommon.—Sanatorium.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roota, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 22,359. Oct. 10, 1911.—Date claimed under International Convention Oct. 10, 1910. New or improved machine for manufacturing hollow bricks closed on all sides. Dr. August Kahr, Kattowitz, Upper Schleswig, Germany. Hitherto in forming extruded bricks it has been usual to manufacture hollow bricks closed on all sides by alternately forming hollow and solid clay bars, this being effected by removing the core employed for forming the hollow bars during the formation of the solid bars. It was, consequently, necessary always to make the core longer than the mouthpiece. This occasioned difficulties in the construction of the press, because if these were to be constructed with the usually relatively long mouthpiece, then the core would have to be exceedingly long. The movement of the core was effected from the mouthpiece in two ways: Firstly, by displacement, the core being conducted along in an opposite direction to the forward pressure of the clay mass, and, secondly, by rotatively arranging the core. This, however, excluded the use of a normal mouthpiece, because by arranging the pivoting point behind the mouthpiece the radius to be described would be so large that even at the commencement

FIG. 1.

FIG. 2.

of its movement the core would strike against the walls of the mouthpiece. This invention is designed to remove the foregoing objections. Within the known type of mouthpiece a cone-shaped or truncated cone-shaped or pyramid-shaped form of core is adapted to be rotated or partially rotated upon a spindle or axle within the said mouthpiece by a crank or eccentric. The core is so mounted that upon its rotation there always remains so much space between it and the walls of the mouthpiece of the press that a hollow clay bar of normal dimensions can always be formed. When the apex or point of the wedge or core is turned towards the

blade shafts of the press, a continuous hollow clay bar will be formed within the mouthpiece. The walls closing the hollow bricks are formed by rotating or partially rotating the wedge or core through an angle of 180° , at which position the clay will converge towards the point of the wedge, forming a solid clay bar at this point. Fig. 1 is a cross section of the mouthpiece, with the broad surface of the wedge or core or former turned towards the front. Fig. 2 shows a similar section, with the point of the wedge turned towards the front. Fig. 3 is a longitudinal section, with the wedge

Fig. 3.

or core in the position shown in fig. 1. A is a mouthpiece, in which is rotatively mounted the core, B, and which may be rotated by means of a crank, C, upon a spindle or axle, D. The core, B, is shown situated with its point or apex turned towards the blade shafts of the press, with its base facing the mouthpiece. In this case a hollow bar, F, will be formed within the said mouthpiece. Fig. 2 shows the core, B, turned or rotated through an angle of 180° , so that its broad side or base faces the blade shafts. The apex or point of the wedge or core facing the mouthpiece causes the clay to converge towards the centre, thereby forming a solid bar, E. It is evident that by correspondingly turning or rotating the wedge solid bars, E, and hollow bars, F, can be alternately formed. It is only necessary to separate these bars at the solid portions, G, H, in a known manner in order to obtain hollow bricks closed in on all sides. June 12, 1912.

PATENT SPECIFICATIONS PUBLISHED AUGUST 22, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 13,921. Nov. 22, 1911.—Frank James, 120 St. Benedict's Street, Glastonbury. Circular saw benches and attachments thereto.

17,457. Aug. 1, 1911.—Heenan & Froude, Ltd., 4 Chapel Walk, Manchester. Apparatus for raising or lowering materials.

17,470. Aug. 1, 1911.—Daniel Atkinson, 1 High Lane, Ridgeway, near Sheffield. Means for preventing overwinding of elevators or lifts.

17,549. Aug. 2, 1911.—James Garvie, 6 Fowkes Buildings, Great Tower Street, London. Making concrete pipes in situ.

17,720. Aug. 3, 1911.—John Croft-Smith, 28 Baker Street, W. Windows, doors, and the like.

18,650. Aug. 18, 1911.—Nicholas Soyer, 118 Long Acre, W.C.; James Spicer & Sons, Ltd., 50 Upper Thames Street; and Capt. W. D. Douglas-Jones, St. Stephen's House, Victoria Embankment, London. Cooking ovens.

20,957. Sept. 22, 1911.—D. J. Jarvis, North Evington Engineering Works, London Street, Leicester. Sandpapering, emery-grinding, and analogous machines.

21,469. Sept. 29, 1911.—Richard Wilson, 72 Pinfold Lane, Skerton, Lancs. Joint for wooden eaves, spouts or gutters.

21,477. Sept. 29, 1911.—Frederick Higham, 48 Rosamund Street West, Chorlton-on-Medlock, Manchester, and A. E. Turner, 172 Medlock Street, Hulme, Manchester. Gas and like valves.

21,697. Oct. 2, 1911.—J. G. A. Rhodin, 96 Albert Street, Camden Town, N. Manufacture of cement.

22,530. Oct. 12, 1911.—C. C. Carpenter, 709 Old Kent Road, London. Gas fires.

23,010. Oct. 18, 1911.—G. G. Brodie and J. D. Prior, Eagle Foundry, Catherine Street, Aston, Birmingham. Cooking ranges.

23,205. Oct. 20, 1911.—Titus Searson, Eversleigh House, Jacksdale, Notts. Jointing of earthenware pipes.

26,475. Feb. 26, 1912.—R. W. Anderson, 53 Derby Road, Bootle. Method of and means for insulating walls, ceilings, &c., against conduction of heat.

28,127. Dec. 14, 1911.—Frederick Ullmer, 72 Clissold Road, Stoke Newington, N. Lift valve for controlling the flow of liquids.

28,488. Dec. 18, 1911.—Toich Nakahara, 507 West 147th Street, Manhattan, U.S. Electric door openers.

29,391. Dec. 30, 1911.—Date claimed under International Convention Feb. 6, 1911. R. H. Lange and W. C. Knebelkamp, 701 Adde Street, Belleville, St. Clair, Illinois, U.S. Door holders.

968. Jan. 12, 1912.—Lucien Adenot, 9 Ave. de St. Ouen, Paris. Draft excluder for doors and the like.

1,439. Jan. 18, 1912.—Joseph Stokes and Hoskins & Son, Ltd., Neptune Works, Trinity Street, Bordesley, Birmingham. Ladders.

1,510. Jan. 19, 1912.—Haney Fire Apparatus Co., Stockton, California, U.S. Fire-fighting or extinguishing apparatus.

2,526. Jan. 31, 1912.—G. W. Ansley, Spokane, Washington. Nail extracting attachment for hammers.

2,802. Feb. 3, 1912.—S. M. Wilmot & Co., Ltd., and S. M. Wilmot, Albert Road, St. Philips, Bristol. Construction of gates for field, estate and general purposes.

4,322. Feb. 21, 1912.—Edward Hotton, Truro House, Carlton Hill, Brighton, and C. H. Harris, architect, Royal Pavilion, Brighton. Automatic apparatus for opening greenhouse windows, skylights, fanlights, and other hinged sashes.

6,407. March 14, 1912.—B. R. Wagner, Crimmitschau, Saxony. Steam heating apparatus.

8,200. April 4, 1912.—Arthur Packscher, 140 Herzbergstr., Lichtenberg, Berlin. Glazed frames.

8,243. April 4, 1912.—L. B. de Laitte, 73 Moorgate Street, E.C. Measuring devices of apparatus for carbureting air.

8,404. April 9, 1912.—Wilhelm Leigener, 6 Mittelstr., Verdingen-on-Rhine, Germany. Walls.

9,291. April 19, 1912.—L. O. Forman, 315 Montrose Avenue, South Orange, Essex, U.S. Hoisting apparatus.

13,707. June 11, 1912.—W. H. Tibbals, 209 E. Colvin Street, Syracuse, N.Y. Hand fire extinguishers.

THE ROYAL NATIONAL EISTEDDFOD AND WELSH HOUSING.

THE Welsh Housing Association, taking advantage of this annual function in Wales, proposed to the Art, Crafts, and Science section of the Wrexham Eisteddfod that the question of housing should be included in their lists of subjects. The arts committee readily responded, and the general committee with equal readiness approved of a competition scheme drawn up by the Welsh Housing Association, with the result that a prize of £50 was offered, to which the Association contributed.

The scheme of the competition was, broadly, as follows:—Plans were to be submitted for dwellings suitable for families of the wage-earning class, to let respectively at 2s. 6d., 3s. 6d., 5s. 6d. and 7s. (not including rates).

The general conditions were prepared so as to place all competitors in the same position, without regard to any particular site, and, as a consequence of these conditions, the designs themselves, as submitted, would not necessarily be those which would be actually carried out, but in each case might require modifications of size but not of principle or planning.

The conditions in other respects admitted of a great deal of elasticity, and, to quote a part of them, were intended "to afford assistance and guidance to builders, landowners, and house occupiers and others, in the provision and orderly maintenance of healthy homes and suitable amenities in Wales, as understood by the highest standard of practical hygienic science."

The businesslike stringency of the conditions was calculated to exclude the amateur, and to make the competition one worth the consideration of the professional and expert designer, and an examination of the drawings sent in and exhibited shows how effective in this respect the conditions have been. Twenty-nine competitors have sent in drawings, all of which show evidence of very considerable skill and expert knowledge, and in this respect have made the adjudication one of considerable anxiety and difficulty. The adjudicators in their award state that the twenty-nine sets of plans (119 drawings) show a great deal of good and careful work, and that some of them are excluded only through being confined to one or two types of cottages, while others have designed the four types. The whole of the drawings are on exhibition at Wrexham.

The judges considered that as this was a competition intended to provide cheap cottages for the working class,

they ought to give most weight to success in the two cheaper designs—namely, Classes A and B. They first selected thirteen as being the most promising, and by a process of elimination reduced these to five, and then to three. As a whole, the adjudicators thought that all the competitors were at their best when dealing with the smaller cottages but that hardly any of the competitors realised fully that in a very cheap cottage every inch of height above the necessary minimum is so much less in floor space, where it is so much more valuable than in added height.

In the final selection for the award, the designs sent in by "Betterment" and "Ivy" were considered to be of equal merit, having regard to the points in design of all four classes; but a third competitor made a very good rival and had decided merits, particularly in the cheapness and simplicity of his designs. The motto of the third in point of merit is "Black Circle," and although only one prize is given, the adjudicators had also regard for the very considerable merits of the designs of "Economist" and "Putting Green" by placing them fourth and fifth.

In the conditions set out for the competition, besides the money prize a medal or diploma was offered to competitors who sent in a treatise dealing with housing conditions as they exist in Wales, or in any particular Welsh county or group of counties. It is much to be regretted that no such treatises were sent in by any of the competitors, who contented themselves with a general description of the work they had prepared.

Under condition 11, the designs are technically the property of the Welsh Housing Association, and it is their purpose to be a medium between the designer and intending builders, so that some really valuable consideration may accrue to the competitors themselves should opportunity offer, and it is not at all unlikely but that the Association may utilise one or more of the designs, paying to the competitors the ordinary professional fees.

It remains only to be mentioned that one of the adjudicators is an architect practising in Liverpool, Mr. T. Taliesin Rees, F.R.I.B.A., and the other, Mr. Aneurin Williams, M.A., who is chairman of the Board of Directors of the Letchworth Garden City, and, it may be mentioned incidentally, is also a grandson of the famed Iolo Morganwg. These gentlemen were unanimous in their award, but had it been otherwise, Mr. Henry T. Hare, M.A., F.R.I.B.A., was to have been the umpire. Mr. Hare, it will be recalled, is architect to the Bangor University College.

NEW STAINED WINDOWS AT ST. BARBARA'S, ASHTON-UNDER-HILL.

THREE beautiful stained-glass windows, which have just been placed in the chancel of the church of St. Barbara, Ashton-under-Hill, Evesham, by Mr. Proctor Vernon-Wadley, were dedicated on Sunday. Those on the south side are designed with figures of the four Evangelists enclosed with borders and canopies, their respective emblems in the bases and emblems of the Trinity, &c., in the tracery. The north window represents St. Barbara, the patron saint. St. Barbara, with the Sacramental Cup in the first light, with an angel carrying a harp and chanting in the adjoining one; above these figures a choir of angels with musical instruments and carrying the crown, and in the tracery her emblem of the Tower. This dedication is interesting Ashton-under-Hill, being the only church in England dedicated to St. Barbara. There is a brass plate with inscription. The windows were designed and painted by Messrs. F. Holt & Co., Warwick.

TRADE NOTES.

UNDER the direction of Messrs. E. L. Maddock & Son, architects, Hanley, Messrs. Kershaw, Brasington & Co. have been favoured with an order for eighty-eight of Brasington's latest improved double-air pump extract ventilators in copper. They have also been favoured with the order for the ventilating work of the new secondary school at Lancaster for the Corporation, under the direction of Mr. Littler, county architect, Preston.

THE ring of eight bells (tenor 18 cwt.) of the parish church of Kirton-in-Holland, near Boston, Lincs., is to be rehung with iron headstocks and all modern fittings. The work of restoration, which includes the recasting of the seventh and fourth bells, is being carried out by Messrs. John Warner & Sons, of the Spitalfields Foundry, London.

THE new schools, Fakenham, are being supplied with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

VARIETIES.

THE Kilbirnie School Board have decided to erect a school for 400 children between Kilbirnie and Glangarnock. The plans have been prepared by Messrs. H. & W. Barclay, architects, Glasgow.

THE Dublin Joint Hospital Board last week appointed Mr. James Mackey, of Dublin, as quantity surveyor for the sanatorium for consumptives proposed to be erected at Crookslin at a cost of £30,000.

EXTENSIONS of King's Cross Hospital, Dundee, to cost £11,833, have been approved by the Public Health Committee of Dundee Town Council. The work includes the erection of a new pavilion for cases of measles.

At the last meeting of Camborne Urban District Council it was stated that the Local Government Board had sanctioned the North Cliff sewerage scheme and the loan of £24,750 for carrying it out. It was decided to hold a special meeting to consider the question of inviting tenders.

THE strike of Whitby builders' labourers has been settled by the acceptance of the men of the offer of the masters to concede an advance of $\frac{1}{2}$ d. per hour—namely, to $5\frac{1}{2}$ d. instead of the 6d. the men demanded. The advance will mean an increase of 2s. 0 $\frac{3}{4}$ d. per week, or 1s. 6 $\frac{1}{2}$ d., after the deduction of $\frac{1}{2}$ d. is made for the purpose of the Insurance Act, which was one of the reasons assigned for the strike.

THE Dundee builders have consented to increase the workmen's wages $\frac{1}{2}$ d. per hour. Various important contracts are on hand just now, and the hewers who have hitherto had 8 $\frac{1}{2}$ d. per hour will be paid 9d., while the builders will rise from 9d. to 9 $\frac{1}{2}$ d. The increased pay takes effect as from September 1.

A STEEL bridge across the Willamette River at Portland, Oregon, is nearly completed, says the British Consul. It has two roadways, the lower for railway traffic and the upper for street cars, both with double tracks. The lift span weighs 4,300,000 lb., and, to permit the passage of vessels, the lower deck telescopes against the upper one, and, if the height is insufficient, both are raised, leaving a passage way of 140 feet above high water, 252 feet wide. Its total length is 1,623 feet, and the steel trestle approaches measure 729 feet.

THE Humber Conservancy Board propose to carry out the following works, provided satisfactory terms are arranged with the Humber Commercial Railway and Dock Company: (1) The erection of a steel lighthouse, 125 feet high, carried on piles and connected with the shore by a ferro-concrete jetty. (2) The erection of a movable steel lighthouse, 100 feet high, constructed on a ferro-concrete staging, and connected with the high lighthouse by a ferro-concrete jetty. (3) The erection of a new lightkeeper's house on the mainland near the proposed high light.

THE old can be so old that it becomes entirely new. This was the view taken by Mr. C. B. Cochran when, as general manager of Shakespeare's England, Earl's Court, he decided to make the great autumn attraction a circus which would not only revive interest in England in this form of entertainment, but would, in fact, be the best of twelve Continental circuses. That Mr. Cochran was right in believing that the people would revel in the ring run on the latest lines is proved by the fact that in the first week some 80,000 visitors witnessed the big circus in the Empress Hall, and the number of spectators has grown daily since. The charm of this effort is that there is absolutely no waste product in the big circus: it is all good. There is nothing cheap about this entertainment save the price of the seats, which range from 6d. to 3s. Nothing so graceful or dashing as the Seven Human Aeroplanes has been seen in this country, and the aerial flights of these superb artistes rouse the plaudits of the people. Then there is such variety as a mélange of Continental clowns, the gymnastic feats of the Sisters Klos, the acrobat dash of twenty Arabs, the equestrian wonders of the Proserpi Family, the tumbling and balancing tricks of the Italia Troupe, the massing of sixteen of Busch's Berlin horses in the arena, and the wild charges of Mde. Beketow's six stallions. Then, by way of a sensational finale, there is the Motor Race in Mid-air, a most thrilling ride, in which, when the two cars leap into space, the rear one passes the leader and lands first on the second portion of the broken track. This is an absolute hair-raiser, and it is wonderful to learn that the intrepid motorists, a man and a woman, have never met with a serious accident. The big circus is but one of a host of novel attractions at Earl's Court, and there is no question that enterprise has made Shakespeare's England the resort of the holiday season. The programme is varied week by week.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

•• As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

CHORLEY.—Sept. 9.—The Chorley Education Committee invite designs for a Council school which they propose to erect in Duke Street, Chorley, to provide accommodation for about 500 children. A copy of the conditions with respect to the submission of designs may be obtained at the Education Office, Town Hall. Intending competitors may also obtain a block plan of the site from the Education Office on payment of a deposit of £2 2s., which will be returned on receipt of a bona-fide design. Designs must be sent by September 9 to Mr. J. Mills, town clerk, Chorley.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelly.

CONTRACTS OPEN.

AXBRIDGE.—Sept. 19.—For constructing new latrine building on the men's quarters of the workhouse. The Board Room, Workhouse, Axbridge.

BEDWORTH.—For erection and completion of a Baptist Chapel, Coventry Road. Mr. T. R. J. Meakin, M.S.A., architect, 11 Warwick Row, Coventry.

BIRKENHEAD.—Sept. 16.—The Guardians are prepared to receive tenders for the supply and erection of a sounding screen in their boardroom in Birkenhead. Messrs. E. Kirby & Sons, architects, 5 Cook Street, Liverpool.

BLACKBURN.—Sept. 23.—For erection of new public halls on Blakey Moor (sub-structure section), for the Corporation. Send applications and £1 1s. deposit to Messrs. Briggs, Wolstenholme & Thornely, and Messrs. Stones, Stones & Atkinson, joint architects, Richmond Terrace, Blackburn.

BRIGHOUSE.—Sept. 13.—For erection of a shed, 132 feet by 62 feet, at Brookfoot Mills, for Messrs. Turner & Wain-

wright. Messrs. Sharp & Waller, architects, 32 Bradford Road, Brighouse.

BROADCLYST.—Sept. 16.—For the rection of new cow-houses at Clyston Mills, Broadclyst, Devon, for Sir Thomas Acland, Bart. Messrs. E. H. Harbottle & Son, architects, County Chambers, Exeter.

DUBHAM.—Sept. 17.—The County Council invite sole tenders for new Council School at Waldrige Lane (for about 450 scholars); alterations and additions at Birtley George Street and Wingate Council Schools; and erection of caretakers' houses at Horden Colliery Council School. Apply (1) for Waldrige Lane, Birtley George Street, and Horden caretaker's houses (plans, specifications, and conditions only for Horden), at the office of Mr. W. Rushworth, Shire Hall, Durham; (2) for alterations at Wingate, at the office of Mr. N. Richley, Shire Hall, Durham.

ELLAND.—Sept. 10.—For the mason's and bricklayer's, carpenter's and joiner's, plasterer's, plumber's and glazier's, ironfounders and structural engineer's, and concretor's work required in erection of a four-storeyed fireproof mill, 157 feet long by 70 feet wide, and chimney, 50 yards high, at Wellington Mills. Send names by Sept. 10 to Mr. T. Kershaw, A.R.I.B.A., architect, 26 George Street, Halifax.

ESKMEALS.—Sept. 16.—For extensions and alterations to the range house, Eskmeals, Cumberland, for Messrs. Vickers, Ltd., either for the whole of the work or for separate trades—viz.: (1) Excavation, concretor, drains, and tar-macadam; (2) waller and mason; (3) bricklayer and tiler; (4) carpenter and joiner; (5) plumber, glazier and painter. Deposit £1 1s. Messrs. Vickers, Ltd.

FOLESHILL.—For erection and completion of seven houses, Coventry Road and Windmill Lane, for the Lockhurst Lane (Foleshill) Industrial Co-operative Society, Ltd. Mr. T. R. J. Meakin, M.S.A., architect, 11 Warwick Row, Coventry.

GRIMSBY.—Sept. 17.—For erection of a new Council school in Victoria Street, for the Education Authority. Deposit £2 2s. Mr. H. C. Scaping, architect, Court Chambers, Grimsby.

HULL.—Sept. 18.—For the builder's and ferro-concrete work required in the construction of electricity sub-station at St. Andrew's Dock. Mr. A. E. White, M.I.C.E., city engineer, Guildhall, Hull.

HULL.—Sept. 19.—For the necessary work to be performed in the erection of a fishermen's school in Boulevard, for the Education Committee. Deposit £2 2s. Mr. J. H. Hirst, city architect, Guildhall, Hull.

IRELAND.—Sept. 13.—For building a cinematograph theatre in King Street, Cork. Messrs. A. & H. H. Hill, architects, 22 George's Street, Cork.

IRELAND.—Sept. 13.—For erection of a caretaker's lodge at the Botanic Gardens, Glasnevin, Dublin. Deposit £1. The Office of Public Works, Dublin.

IRELAND.—Sept. 18.—For the construction of Government Offices in Upper Merrion Street, Dublin. Deposit £5 5s. The Secretary, Office of Public Works, Upper Merrion Street, Dublin.

IRELAND.—Sept. 25.—For the erection and furnishing of National School buildings at Derrinkehir, Ballinamore, Co. Leitrim. Royal Irish Constabulary Barracks, Ballinamore.

KENILWORTH.—Sept. 19.—For erection of lodge, chapel, &c., in connection with proposed cemetery, for the Urban District Council. Deposit £3 3s. Mr. S. Douglas, C.E., architect and surveyor, Council Offices, Kenilworth.

LEEDS.—Oct. 7.—For the supply and erection of a steel and corrugated iron building, and the necessary surface-water drainage of the same, at the permanent way depot, Sovereign Street, for the Tramways Committee. Send applications by Sept. 30 to Mr. J. B. Hamilton, general manager, Leeds.

LIVERPOOL.—Sept. 12.—The Guardians of the West Derby Union invite tenders from local firms for converting old laundry buildings at the workhouse, Rice Lane, Walton, into stores, engine-room, &c. The Master of the Workhouse.

LONDON.—Sept. 11.—For external painting, repairs to the stonework, and pointing work where required at their branch workhouse, Wood Green, N., for the Guardians of St. Leonard, Shoreditch. Mr. F. J. Smith, F.R.I.B.A., Parliament Mansions, Victoria Street, S.W.

LONDON.—Sept. 12.—For erection of the buildings required for an extension of their electricity works at Millfields Road, Clapton, N.E., on the river Lea, for the Hackney Borough Council. Messrs. Gordon & Gunton, architects, Finsbury House, Blomfield Street, E.C. Send £2 2s. deposit to Mr. W. A. Williams, town clerk, Town Hall, Hackney.

LONDON.—Sept. 12.—For the construction of a public underground convenience on the eastern side of Kingsland Road, to the north of Middleton Road, for the Hackney Borough Council. Mr. Norman Scorgie, M.I.C.E., borough engineer and surveyor.

LONDON.—Sept. 19.—For general repairs, painting, and lead roof works at the public baths, Kennington Road, S.E., for the Lambeth Borough Council. Mr. H. Edwards, C.E., borough engineer.

LONDON.—Sept. 25.—For constructing verandahs and for alterations to fire-escape staircases at the Brook Fever Hospital, Shooter's Hill, Woolwich, S.E., for the Metropolitan Asylums Board. Deposit £1 1s. Mr. W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, the office of the Board, Embankment, London, E.C.

MITCHAM.—For erection of sixteen small houses at Mitcham. Mr. F. R. Goodall, estate agent, 4 High Road, Streatham, S.W.

MONMOUTH.—Sept. 18.—For concreting the floors of two dining sheds and a guard hut belonging to the Royal Monmouthshire Royal Engineers (Special Reserve), in a field about a mile and a half from Troy Station, Monmouth. The Officer Commanding Royal Monmouthshire Royal Engineers (S.R.), The Castle, Monmouth.

NORTHWICH.—Sept. 12.—For rebuilding the Constitutional Club and new central offices at Witton Street. Deposit £1 1s. Mr. J. Cawley, architect, the Bull Ring, Northwich.

NOTTINGHAM.—Sept. 11.—For erection of a school, Sneinton Dale, for the Education Committee. Deposit £2 2s. Mr. F. B. Lewis, city architect, Guildhall, Nottingham.

OLDHAM.—Sept. 11.—For the following works: (1) Erection of a cart shed in Rhodes Bank Yard; (2) re-slating roof, raising ceiling, &c., at Waterloo stables, for the Carrying and Cleansing Committee. The Borough Surveyor's Office, Town Hall, Oldham.

PRESCOT.—Sept. 11.—For the following works, for the Guardians—viz.: (a) Erection and completion of a house in Warrington Road, Whiston; (b) erection and completion of a strong room at the union offices, Whiston (deposit £1 for a and b); (c) cleaning and painting the exterior and interior of six infirmary blocks at the workhouse, Whiston (deposit £1). Mr. W. Ellis, architect, 9 Hardshaw Street, St. Helens.

REDCAR.—Oct. 2.—The North Riding of Yorkshire County Council Education Committee invite full tenders for erection of a cookery and manual instruction room at West Dyke Council school. Mr. Mennell, Cleveland District Education Office, Redcar.

SCOTLAND.—Sept. 13.—For the following departments of work in connection with the erection of proposed Town Hall, Portobello—viz.: Excavator, mason and brick work, carpenter and joiner work, plumber work, plaster, cement and tile work, steel and iron work, slater work, glazier, and asphalt works. Mr. James A. Williamson, A.R.I.B.A., architect, Public Works Office, City Chambers, Edinburgh.

SCOTLAND.—Sept. 14.—For the mason and bricklayer, carpenter, slater, plumber, plasterer, concrete, and painter works of new dairy premises, stabling, and covered yards, &c., to be erected at Waterloo Place, Inverness, for the Farmers' Dairy Co. Mr. T. Munro, architect, 62 Academy Street, Inverness.

SCOTLAND.—Sept. 17.—For erection of new Letter and Parcel Sorting Office, Perth. Tenders are required for the whole work, and not for separate trades. Deposit £1 1s. The Head Post Office, Perth, and H.M. Office of Works, 3 Parliament Square, Edinburgh.

SCOTLAND.—Sept. 17.—For erection of a labour exchange at Lauriston Place, Edinburgh. Tenders are required for the whole work and not for separate trades. Deposit £1 1s. His Majesty's Office of Works, 3 Parliament Square, Edinburgh.

SALFORD.—Sept. 25.—For alterations and additions to the town hall, police department, and sessions court, for the Corporation. Deposit £2 2s. Mr. J. B. Broadbent, A.R.I.B.A., 15 Cooper Street, Manchester.

SHERBURN-IN-ELMET.—Sept. 12.—The West Riding Small Holdings and Allotments Committee invite whole tenders for additions to farm buildings at Sherburn-in-Elmet. The West Riding Land Agent, County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

SULBY.—Sept. 10.—For erection of a new chapel, for the Trustees of Sulby Wesleyan Chapel. Mr. J. E. Tearse, Athol Street, Douglas.

SUMMERHILL.—Sept. 12.—For the execution of repairs, &c., at Gwersyllt Vicarage, Summerhill, Wrexham. Mr. J. H. Swainson, architect, 42 Regent Street, Wrexham.

TOWCESTER.—Sept. 14.—For erection of seventeen houses, for the Rural District Council. Messrs. Jackson Stops & Co., architects, Town Hall, Towcester.

WALES.—Sept. 17.—For the construction of foundations for a gasholder, for the Tredegar Urban District Council. Mr. D. W. Davies, Tredegar.

WALES.—Sept. 20.—For carrying out the following works: (1) Extensions and alterations at the Blaenllechau infants' Council school (deposit £1 1s.); (2) alterations at the boys' and girls' departments of the Cwmclydach Council school (deposit £1 1s.); (3) repairing and laying cement concrete at the Dinas boys' school playground (deposit 10s. 6d.); (4) repairing and asphaltting playgrounds at the boys' and girls' departments of the Williamstown Council school (deposit 10s. 6d.), for the Rhondda Urban District Council. Mr. J. Rees, architect, Hillside Cottage, Pentre.

WALES.—Sept. 24.—For the pulling down and reconstruction of the Star Hotel, Ystrad, Rhondda. Send names and £2 2s. deposit by Sept. 16 to Mr. T. E. Richards, A.R.I.B.A., architect and surveyor, Pontypridd and Cardiff.

WALES.—Oct. 2.—For erection of four houses at Cwm-rhydyceirw, near Morriston, Glamorganshire, for the Great Western Railway Co. The Engineer at Neath Station.

WARRINGTON.—Sept. 19.—For the supply and fixing of stone steps and iron railing for Howley footbridge, for the Bridges Committee. The Borough Surveyor's Office, Warrington.

WORSTHORNE.—Sept. 11.—For erection of a temporary elementary school for 120 children at Worsthorne, near Burnley, for the Lancashire Education Committee. Builders' work consists of the foundations of the school buildings and the whole of the latrines, drains, fencing, and playground forming. Deposit £2. Mr. H. Littler, county architect, 16 Ribblesdale Place, Preston.

YORK.—Sept. 17.—For erection of an engine shed at York, for the North-Eastern Railway Co. Mr. William Bell, the Company's architect, at York.

TENDERS.

BISHOP'S CLEEVE.

MESSRS. CRAVEN & SPEEDING BROTHERS, of Monkwearmouth, Sunderland, propose, it is stated, to establish new works at Doncaster, for the manufacture of wire ropes for collieries, steel hawsers, wire rigging, binder twine, and Manila ropes.

THE Glasgow Corporation have under consideration a recommendation of the special sub-committee of the Statute Labour Committee that a new road and bridge be constructed from Great Western Road, at Botanic Gardens, to the end of Queen Margaret Drive, at an estimated cost of £86,800.

THE Swansea Parliamentary Committee last week discussed the question of the development of the Corporation Town Hall site for building, and it was decided to communicate with the tramway engineers as to their terms for acting in the matter of constructing a tramway up Mount Pleasant so as to make the hill accessible.

MR. L. S. CARR has been appointed constructional engineer for the erection of the Corporation electric power station at Neshells, Birmingham. Mr. Carr, who is thirty-eight years of age, received his training at Rutherford College, Newcastle-on-Tyne. The salary for the appointment commences at £400 per annum, rising to £500 at the discretion of the Electricity Committee.

A COMPANY under the style of Walter Cawood, Ltd., has just been formed to carry on the business of the late Walter Cawood, Manchester, as organisers of exhibitions, &c., in Manchester, London, and other important towns. The directors of the company are Mrs. Catherine Cawood (widow of the late Walter Cawood), Mr. Frederick W. Bridges, 124 Holborn, London, E.C., the well-known exhibition organiser, and Mr. Charles H. Luke, joint organising manager with Mr. F. W. Bridges of the Engineering Exhibition, Olympia, 1912, and director of the successful Manchester Engineering Exhibition, October-November 1910. The registered offices are at 196 Deansgate, Manchester. Branch offices: 25a Paradise Street, Birmingham, and 37 West George Street, Glasgow.

NEW CATALOGUES.

"DURESCO: its Nature and Application," is an excellent pamphlet just issued by John Line & Sons, Ltd., Birmingham, to further popularise a water paint which has been before the public for over thirty years. The base of the material has always been a non-poisonous zinc-white pigment of permanent character, and of great body and density, while no whitening or calcareous matter enters into its composition. It was originally introduced as a treatment for new plaster on which neither size-colour nor oil paint could be successfully used. Since that time its uses have widened enormously, until now it is ranked as one of the best and most versatile friends of every house decorator. Duresco is stocked in three whites and about sixty tints, while intermediate tints may safely be obtained by blending or mixing one Duresco colour with another. An invaluable feature of the booklet is the account of various classes of Duresco work, both interior and exterior, with notes on methods of treatment. One notable example illustrated is the Birmingham Council House extension, the interior of which, with the adjoining museum and art galleries, was decorated with Duresco. The pamphlet is an eminently practical one, and contains much splendid information.

THE cardinal rule for good artificial illumination for all purposes is that the light should be well diffused with a preponderating downward direction, and freely flood ceilings and walls. Complaints are not infrequently heard as to the abysmal ignorance of architects on the important subject of illuminating engineering and of their readiness to be deceived by plausible agents and pretty fittings. There undoubtedly is something extraordinarily attractive in many of the up-to-date accessories of lighting. Yet, however elegant the designs may be, it must be remembered that beauty cuts a sorry figure unless accompanied by utility and consistency. Fortunately, these are strictly compatible. In Holophane glassware, for example, the three qualities are worthily combined. This particular variety has gained nothing short of a world-wide reputation for its reflecting capacity and its adaptation for the lighting of public buildings, hotels, shops, theatres, &c. Messrs. Siemens Brothers, Dynamo Works, Ltd., have just issued a twenty-page price list, No. D6, dealing with Holophane fittings, reflector-bowls and spheres, and giving an excellent selection of fittings specially designed for use in conjunction with the glassware. An effort has been made to produce fittings which could be used in practically every type of installation. There are, for example, new patterns of the "Household" Holophane for single "Wotan" and "Tantalum" lamps costing 3s. 6d., and for a Holophane pendant designed in the Georgian period costing 350s. Between these two there are many varieties of really excellent metalwork. Should, however, none of them be exactly what is required, the firm is willing to supply other designs to suit any period of decoration or for any special purpose.

MESSRS. S. W. FRANCIS & Co., LTD., 64-70 Gray's Inn Road, W.C., have brought out a revised edition of their illustrated catalogue and list of prices. Illustrated particulars are given of various rolling shutters, gun-metal shop fronts and fittings, collapsible metal gates, wrought-iron doors, swinging signs, full size sections of brass sash bars (nine pages), half full-size sections of machine drawn brass stall plates (five pages), and sketches of their plate glass facias and tablets. A suggestive list is given of some of the firm's recent contracts, which includes names sufficient in themselves to guarantee excellence. Particular attention is called to their new patent "No. 4" steel hinged self-acting pine wood shutter; the unique feature is that its best steel spiral springs run throughout the entire breadth of the shutter and bearing, thereby ensuring against any deflection from unevenly distributed weight. The only fault to be found with this catalogue is that its forty-eight pages are not prefaced by an index. It is scarcely sufficient in these days to group the various departments of a business together in a price list without a clear guide as to the contents.

THE Powell Wood-Process Syndicate, Ltd., Salisbury House, London Wall, E.C., have prepared an eighty-page booklet fully explaining their comparatively new method of rapidly seasoning, preserving and improving wood. It is just ten years since the value of saccharine matter as a natural wood preservative was discovered in an endeavour to prevent dry rot. The principle was that as sugar is crystallised sap, and thus an amorphous kind of wood, saccharine solutions would fill the interstices of wood, and so prevent the ingress of the mycelium of dry-rot. Since 1902 experiments have been continuously conducted, at a cost of nearly £20,000, to

perfect the process and to prove its efficiency. It found immediate favour in Australia and New Zealand, and plants are in active operation in those progressive countries, as well as in India. Works in the neighbourhood of London are expected by the syndicate to be finished in October. The process is natural and inexpensive. The timber is not subjected to any external pressure or vacuum. It is first immersed in a saccharine solution in open tanks. This solution is gradually raised to specific temperatures for certain periods, depending on the size, density, and purpose of the wood. The air and moisture of the wood escapes, the albuminous matters are coagulated, and the solution, otherwise liquid timber, is absorbed into the pores. The wood is next placed in a drying chamber. When sufficient desiccation has taken place the wood is absolutely seasoned and ready for immediate use. The time occupied is generally a few days, though in special cases it may extend to three or four weeks. The Chief of the Department of Applied Chemistry of the Indian Institute of Science stated in 1909 in his report, "no amount of exposure to weather could remove the saccharine matter from the wood, so there seems to be no way whereby thoroughly Powellized wood could decay or rot. . . . By the treatment, woods appear to become more close grained and capable of taking a better polish. . . . The process communicates no smell to the wood, and does not remove any odour which the natural wood may happen to possess. . . . Powellized wood seems to be less inflammable than the same wood in its natural condition."

THE manufacture of cooking apparatus is an important part of the Carron Company's huge business. About twelve months ago they brought out a catalogue of nearly two hundred pages, which dealt exclusively with kitchen ranges. This has now been supplemented by a handsome catalogue of 164 pages, illustrating, describing, and giving the prices of the varied apparatus now indispensable in a proper "batterie de cuisine." It is divided into two sections, the first being concerned with coal, coke, and steam heat, the second with gas and electric. The catalogue opens with several photographs of large installations by the Carron Company, such as at the L.C.C. Training College for Chefs. Next follow a number of splendid ranges, worthy of the largest hotel or restaurant, together with a few suitable for much humbler establishments. Then come roasting ranges, grilles, baking ovens, steaming ovens, hot closets and carving tables, steam-jacketed pans, water boilers, tea infusers, &c. These same adjuncts are repeated in the second section. It may be fearlessly said that for over a century and a half "Carron" ranges have been recognised as the standard. Their latest catalogue shows the firm to be among the greatest aristocrats of their trade; but it must not be forgotten that they cater for the small builder as well as for the hotel syndicate and millionaire householder.

CLARIDGE'S PATENT ASPHALTE CO., LTD., 21 Surrey Street, Victoria Embankment, W.C., have sent us a copy of an illustrated pamphlet on the uses and fireproof properties of their material. Since 1838 Claridge's asphalt has been increasingly employed for roofs, floors, damp courses, reservoir linings, &c. A warning is given that, to prevent the substitution of inferior materials, the name of the company is impressed on the two opposite sides of each block. It is recommended that the workmen of the company should be specified to lay the asphalt. The pamphlet includes a useful alphabetical list of various classes of work and the thickness of asphalt recommended for them. Particular stress is laid on the long list of breweries in all parts of the country where the company have executed the flooring.

"VELOGRAPHY," as most of our readers are doubtless fully aware, is the name given by Messrs. Norton & Gregory, Ltd., to their method of reproduction. From their premises in Castle Lane, Westminster, there has come to us a suggestive booklet entitled "The Advance of Velography." It is claimed that "Velography" copies are equal in every respect to original drawings as there is no thickening or blurring of the lines, which are of a permanent deep black, and they are absolutely to scale, being untouched by liquid. A very marked feature is the speed with which orders can be executed. Fifty or even more "Velography" facsimile copies of one Double Elephant tracing can be obtained in less than an hour. There is practically no limit to the choice of material on which the copies may be made, and they may be printed in any desired colour. The copies can be made direct from inked drawings, if necessary. Messrs. Norton & Gregory make a speciality of getting up finished tracings for competition work from rough pencil drawings. Tracings received by post are returned with copies the same day. The booklet contains all the necessary information

THE ARCHITECTURAL ASSOCIATION EXCURSION, 1912.

PLAISH 1912 C.E.B.

WILDERHOPE. 1912 C.E.B.

Sketches by Mr. C. E. BATEMAN, F.R.I.B.A.

about this successful process to enable a customer to do his share towards obtaining the best results and receiving the utmost satisfaction. It concludes with a brief account of the firm's large drawing office and mounting department. Copies will be sent on application.

THE Govan District Lunacy Board have accepted an offer of £3,883 for the installation of electric lighting at Hawkhead Asylum.

THE Boston Town Council have accepted the tender of Messrs. Goddard, Massey & Warner, Ltd., of Nottingham, for the erection of the new town bridge. There were eight tenders, and the one accepted was for £5,612 11s. 6d.

MESSRS. W. FIRTH, LTD., iron and steel merchants, of Leeds, have bought a site in the neighbourhood of Balby Road and Silvester Avenue, Doncaster, alongside the Great Northern Railway, upon which they propose to erect extensive works for the manufacture of steel girders.

THE Tipton District Council have accepted the following tenders for the proposed improvements and extensions of the gasworks, amounting to £10,874:—Mr G. E. Proberts, Bilston, £499, for the boiler-house; Messrs. R. J. Dempster, Manchester, £440 for the scrubber and £235 for the engine and exhaustor; and West's Gas Improvement Co., Manchester, £9,700 for the vertical retorts. It was decided at the same meeting to accept the tender of Messrs. Thompson & Farley, Kidderminster, of £5,696 for works in connection with the sewage disposal scheme.

MR. KINCAID, the manager of the Kirkcaldy Corporation Gas Works, has prepared a scheme estimated to cost £48,000 for the extension of the works, due to the want of storage facilities for coke and defects in the plant of the present works. The scheme includes the erection of a 1,000,000 cubic feet per day retort-house, new coal stores capable of storing 2,000 tons of coal, besides a considerable space for storing in the open. In the cost is included additional water-cooled condensers, 1,500,000 cubic feet capacity, and a washer of 1,500,000 cubic feet per day capacity.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

Newtonmore.—Public Hall (£1,000).

IRELAND.

Cookstown.—School for 120 places. Mr. J. Todd, architect.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 6,980. March 21, 1912.—Improvements in or connected with interlocking concrete slabs or blocks for use in building concrete walls, sheet piling, groins and other structures. R. H. Neal, A.M.I.C.E., M.I.M.E., 4 Mortimer Road, West Ealing. This invention relates to interlocking concrete slabs or blocks of the kind for use in making or building up partitions, walls, groins, breakwaters, dams and other structures. Reinforced concrete slabs are formed with over-lapping or interlocking lugs, which may have a tongue and groove connection with the adjacent slab and which also

Fig. 2.

have perforations there through, so that when a number of such slabs are assembled they may be securely locked together by means of reinforced concrete piles driven into or secured in the ground and passing through perforated lugs. Fig. 2 shows in perspective the adjacent or interlocking ends of two slabs or blocks. Fig. 1 is an elevation of a wall. The slabs or blocks, *a*, are each formed with alternate overlapping ends, *b*, *b¹*, and it is preferred that such ends are provided with ribs or projections, *c*, which engage within the grooves or recesses, *d*, and interlock the slabs when in position. The overlapping ends, *b*, *b¹*, of the slabs are formed with perforations, or eyes, *e*, by means of which they may be assembled and interlocked on reinforced piles, pillars, columns, or posts, *f*. The piles, *f*, may also be of reinforced concrete and of any suitable cross-section. July 31, 1912.

PATENT SPECIFICATIONS PUBLISHED
AUGUST 29, 1912.

10,099. April 29, 1912.—Henry Creighton, 6 Reynolds Road, Old Trafford, Manchester. Regulating taps or cocks.

10,248. April 30, 1912.—Otto Shanks, 231 Great College Street, Camden Town, N.W. Taps or valves for water, steam and the like.

FIRE PROTECTION FOR NATIONAL AND
UNIVERSAL EXHIBITIONS.*

(Concluded from August 23.)

CONSTRUCTION OF BUILDINGS.

14. *Construction*.—The construction of buildings should be determined on the following lines:—

A. *Classification of Buildings*.—The buildings should be divided into four classes structurally, namely, those affording:—

1. Practically "no" fire resistance. 2. "Temporary" fire resistance. 3. "Partial" fire resistance. 4. "Full" fire resistance.

B. *Buildings for Ordinary Exhibits*.—Buildings containing replaceable exhibits, booths for the sale of goods, &c., could be of the first class, i.e. of a construction affording practically "No" fire resistance.

C. *Restaurants, Side-shows, &c.*—The buildings intended to hold the public seated for any period exceeding five minutes, such as restaurants, cinematograph shows, displays,

* Abstract of a Paper by Mr. Edwin O. Sachs, F.R.S.Ed., Chairman of the British Fire Prevention Committee, Vice-President Int. Fire Service Council, &c., presented at the International Fire Congress, St. Petersburg.

side-shows, &c., should be of the second class, i.e. affording "temporary" fire resistance.

D. *Buildings for Irreplaceable Exhibits, Offices, &c.*—The buildings intended to hold works of art and irreplaceable exhibits of an historical character, as also any tower of greater height than 80 feet, the general administrative offices, post office, telegraph or telephone office, police and fire stations should be of the third class, i.e. affording "partial" fire protection, but it is advisable that the highest class of permanent construction affording "full" fire resistance be adopted for housing exhibits of historical importance.

15. *The Ordinary Form of Construction Affording Practically "No" Fire Resistance.*—For the buildings intended to house ordinary exhibits, &c., the following principles should be adopted:—

A. *External Walls.*—The external walls of the buildings should be of a solid, slow-burning or incombustible material not less than 3 inches thick, or of metal or of both.

B. *Floors.*—The floors of the ground floor should be of close boarded rebated or metal jointed floor boards out of not less than 1-inch boarding, on suitable bearers and sleepers, the space thereunder being filled up as far as the ground floor is concerned to the underside of the boards with a dry incombustible material. For first floors the floors should be similarly constructed, but the bearers should be of a slow-burning or incombustible material, and no voids should be permissible. Where linoleum, tiling, or parquetry be used throughout the surface of a floor as a floor covering, plain jointed boarding should be permissible for the floor proper.

C. *Roofs.*—The roofs should be of metal or of some form of non-combustible roofing material throughout, except for any supporting boarding or battens which, if used, shall be out of not less than 1-inch boarding planed, thickly whitewashed, or covered with an approved fire protective paint where exposed. The framing to skylights or lantern lights shall be of metal.

D. *Wall Coverings, &c.*—No canvas or other textile covering shall be used on walls, ceiling, or roof soffits, unless closely pasted to the surface it is to cover throughout, or impregnated so as to be effective in not spreading flame (twelve months guarantee).

E. *Divisional Walls.*—Divisional walls between adjoining parts of a building should be constructed as follows:—

- (a) an independent wall.
- (b) carried up 5 feet above the roofing.
- (c) of "partial" fire-resisting construction,
- (d) having no openings larger than 500 feet super on the ground floor or larger than 250 feet on the first floor fitted with "partial" fire-resisting doors or roller shutters and no openings on any one divisional wall to be nearer to another than 80 feet centre to centre, and
- (e) having every door opening to be fitted with a drencher on each side.

F. *Partitions.*—Partition walls should be of solid slow-burning or incombustible material or hardwood not less than 2 inches thick, metal or incombustible sheets of not less than $\frac{1}{8}$ inch thick or both.

G. *Ceilings.*—Ceilings should be of slow-burning or incombustible material such as plaster boards of not less than 1 inch, incombustible sheets of not less than $\frac{1}{8}$ inch, plaster on metal lathing (the plastering not less than $\frac{1}{2}$ inch thick), or of metal or of hardwood not less than 1 inch thick.

16. *Construction Affording "Temporary," "Partial," or "Full" Protection.*—In buildings affording "temporary" protection the same conditions should prevail as customary where a minor degree of fire-resistance is required of a permanent structure. In buildings affording "partial" or "full" protection similarly the same conditions should prevail as in permanent structures of the higher grades of fire resistance.

17. *Doors and Shutters.*—For doors the following principles should prevail:—

A. *Internal Doors.*—All interior doors should swing both ways.

B. *External Doors.*—All external doors should open outwards and be self-closing.

C. *Panic Bolts.*—All doors, in portions used by the public, should be fitted with panic bolts.

D. *Plinths to Doors.*—Doors should not have projecting plinths, and where leading out on to steps should have a clear 5-foot landing before the first step downwards.

E. *Shutters.*—Where shutters are used they should be of an approved type to open easily from either side.

18. *Exhibition Stands.*—Exhibition stands in the exhibition buildings should be strictly limited in height so as to be kept to a prescribed distance from the roof soffit, ceiling of

gallery floor, &c., as the case may be. Stands comprising erection higher than 7 feet above the floor shall be subject to the same rules as the internal work of the building. All voids under exhibitors' stands or platforms should be filled up, and they should be boarded as the exhibition floors. Counters and movable show-cases could, however, be regarded as furniture.

19. *Timber in the Exhibition Halls.*—All timber used in the exhibition shall be out of not less than 1-inch boarding, planed, thickly whitewashed or painted with an approved fire protective paint (one year guarantee).

20. *Velaria, Awnings, &c.*—Velaria, awnings, shop blinds, &c., are entirely prohibited. Ordinary blinds and flags used inside the building shall be rendered non-inflammable, likewise all curtains, or draperies other than tapestry, velvets, silks, velveteens and carpets.

21. *External Exhibition Stands, Booths, &c.*—Exhibitors' own minor external buildings, booths, &c., should be limited as to height, projections; the proportion of exit facilities to floor space, &c., should be according to the local requirements and character of the exhibition.

22. *Plans of Exhibits, Stands, &c.*—The exhibitors should submit plans of their proposed stands, stalls, booths, counters, buildings, &c., to a uniform scale, and the principles laid down as to their character from a fire point of view should be strictly observed. The administration should provide the necessary administrative machinery to enable them to notify consent, conditional consent, or dissent (with reasons) within ten days of application. The conditions should be expressed in simple language. The powers of the exhibition management as to prohibition of an exhibit, right to screen it or remove it in the case of non-compliance with the rules should be precise and summary. On the other hand, a tactful consideration of individual requirements and conditions must be observed. No stand should, however, be visible to the public until the conditions have been complied with and an approval ticket has been issued to that effect. Galvanised iron screens on casters 7 feet high and suitably inscribed should be available for screening any stand not complying with the conditions, and shall be chargeable at a rate per diem.

23. *Fire Protective Paint, &c.*—Provision should be made for exhibitors to be able to obtain fire protective or non-inflammable paints, the impregnation of textiles, &c., at a tariff not exceeding by 10 per cent. the actual net cost, and a ready and practical means of testing and controlling the materials and work done either at or outside the exhibition should be arranged for, as also a regular inspection of the materials and work as applied to the actual exhibit.

VARIETIES.

MR. JAMES SALLOW, of Dunston, retired builder, who died on July 1 last, aged fifty-eight years, left estate of the gross value of £13,991 6s. 4d., of which the net personalty has been sworn at £78 14s. 11d.

THE plumbers of Dumfries and Maxwelltown have received an increase in the rate of wages of $\frac{1}{2}$ d. per hour, making the standard rate of wages 8d. per hour.

THE question of the provision of small dwellings for the working classes has reached an acute stage in Christiania. According to an American Consular report, the stringent building laws make it almost impossible to secure tenements of one to three rooms and a kitchen. The city is now willing to guarantee mortgages amounting to 75 per cent. of the construction costs to further the building of tenements for workmen, but even these arrangements have not provided sufficient lodgings, and it has been necessary to build wooden barracks to meet the immediate needs.

WE regret to announce the death of Mr. J. H. Burgess, which took place at Manchester on August 27, at the age of sixty-five years. Mr. Burgess was associated practically all his life with Messrs. J. & H. Patteson, marble, granite, and mosaic workers, Oxford Road, Manchester. Entering their employment when quite a youth, he continued with the firm for over forty years, eventually being appointed general manager. A few years ago, in conjunction with Mr. J. E. Mills, he purchased the business as a going concern, and was actively connected with it until shortly before his death. In the marble world Mr. Burgess was well known throughout the United Kingdom and the Continent, frequently visiting and inspecting the most important marble quarries and works to acquire information first-hand, and having during his lifetime's experience with marble and marble working carried out large contracts in many of our notable buildings. The interment took place at the Southern Cemetery, Manchester, on the 29th ult.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

DONCASTER.—The committee of the Yorkshire Institution for the Deaf invite plans for erection of five classrooms, residence for thirty children and staff, and also for a swimming bath. A premium of £50, to be merged in the commission, will be paid to the author of the accepted plans. Mr. B. D. Crouch, secretary, 6 Hall Gate, Doncaster.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelly.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ASPATRIA.—Sept. 17.—For the various works required in erection of a drill hall, &c., at Aspatria, for the 5th Battalion the Border Regiment. Send names and addresses by Sept. 17 to Messrs. W. G. Scott & Co., architects and surveyors, 2 Park Lane, Workington.

AXBRIDGE.—Sept. 19.—For constructing new latrine building on the men's quarters of the workhouse. The Board Room, Workhouse, Axbridge.

BARKISLAND.—Sept. 17.—For erection of scullery house, including mason's, joiner's, slater's, plasterer's, and painter's work, for the Overseers of Barkisland. Mr. T. Hutton, surveyor, Barkisland, Yorkshire.

BEXHILL-ON-SEA.—Sept. 21.—For the reinstatement of the wall to the gardens, and storm-water duct—the whole to be in concrete, supported by six mild steel stanchions—for the proprietors of the Kursaal. Deposit 10s. 6d. Mr. L. Burn, A.M.I.N.E., consulting engineer, 6 Holborn Viaduct, London, E.C.

BOLTON-ON-DEARNE.—Sept. 20.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with Bolton-on-Deerne Highgate new school—viz., builder, joiner, slater, plumber, plasterer, painter, ironfounder and smith, and asphalter. The Education Architect, County Hall, Wakefield, and the Divisional Clerk's Office, Mexborough. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

BRISLINGTON.—Sept. 25.—For erection of an infants' Council school at Brislington, for the Somerset County Council. Mr. A. G. Skilling, Homeside, Brislington, or Mr. A. J. Pictor, A.R.I.B.A., Bruton.

BURLEY.—Sept. 26.—For erection of an additional classroom for 50 children and storeroom, alterations to cloakroom, and regrading, gravelling, and tar-paving playground at Burley Council school, for the Hampshire County Council. Deposit £2 2s. Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

COLD NORTON.—Oct. 11.—For erection of a public elementary school for 80 children, for the Essex Education Committee (Maldon District Sub-Committee). Send names and £2 2s. deposit by Sept. 18 to Mr. F. H. Bright, clerk to the sub-committee, 53 High Street, Maldon. The County Architect, 73 Duke Street, Chelmsford.

CONISTON COLD.—Sept. 20.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with Coniston Cold Council school alterations and repairs—viz., builder, joiner, and plumber. The Education Architect, County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

DOVER.—Sept. 25.—For erection of Dover new post office, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. The Postmaster at Dover Post Office and H.M. Office of Works, Storey's Gate, London, S.W.

DURHAM.—Sept. 17.—The County Council invite sole tenders for new Council School at Waldrige Lane (for about 450 scholars); alterations and additions at Birtley George Street and Wingate Council Schools; and erection of caretakers' houses at Horden Colliery Council School. Apply (1) for Waldrige Lane, Birtley George Street, and Horden caretaker's houses (plans, specifications, and conditions only for Horden), at the office of Mr. W. Rushworth, Shire Hall, Durham; (2) for alterations at Wingate, at the office of Mr. N. Richley, Shire Hall, Durham.

ERPINGHAM.—Sept. 17.—For the erection of bridges and culverts, for the Erpingham Rural District Council. Messrs. A. F. Scott & Son, 24 Castle Meadow, Norwich, and 12 Holborn Hall, London, W.C.

HALIFAX.—Sept. 17.—For execution of the work (various trades) required in the erection of a tramway shelter at Bradshaw. Deposit £1. Mr. J. Lord, M.I.C.E., borough engineer, Town Hall, Halifax.

HULL.—Sept. 18.—For the builder's and ferro-concrete work required in the construction of electricity sub-station at St. Andrew's Dock. Mr. A. E. White, M.I.C.E., city engineer, Guildhall, Hull.

HULL.—Sept. 19.—For the necessary work to be performed in the erection of a fishermen's school in Boulevard, for the Education Committee. Deposit £2 2s. Mr. J. H. Hirst, city architect, Guildhall, Hull.

IRELAND.—Sept. 24.—For additions to Union Hall National School, Leap, Co. Cork. The District Office of Public Works, Cork.

IRELAND.—Sept. 24.—For erection of a Crown post office at Tuam, Co. Galway. Deposit £1. The Office of Public Works, Dublin, and the Post Office, Galway.

IRELAND.—Sept. 25.—For the erection and furnishing of National School buildings at Derrinkehir, Ballinamore, Co. Leitrim. Royal Irish Constabulary Barracks, Ballinamore.

KENILWORTH.—Sept. 19.—For erection of lodge, chapel, &c., in connection with proposed cemetery, for the Urban District Council. Deposit £3 3s. Mr. S. Douglas, C.E., architect and surveyor, Council Offices, Kenilworth.

LEEDS.—Oct. 7.—For the supply and erection of a steel and corrugated iron building, and the necessary surface-water drainage of the same, at the permanent way depot, Sovereign Street, for the Tramways Committee. Send applications by Sept. 30 to Mr. J. B. Hamilton, general manager, Leeds.

LEEDS.—Sept. 16.—For the bricklayers' and masons', carpenters' and joiners', plumbers', plasterers', slaters' and painters' work required in the alterations and additions to the imbecile wards at the union infirmary, Beckett Street. Separate tenders are required for each class of work. Mr. J. Mitchell Bottomley, architect, 2 Basinghall Square, Leeds.

LITTLE HULTON (LANCS.).—Sept. 17.—For the conversion of two old shops into cottages, 470-472 Manchester Road East. The Committee of the Little Hulton Industrial Co-operative Society, Ltd.

LONDON.—Sept. 19.—For general repairs, painting, and lead roof works at the public baths, Kennington Road, S.E., for the Lambeth Borough Council. Mr. H. Edwards, C.E., borough engineer.

LONDON.—Sept. 20.—For the conversion of their schools in Newcomen Street, Borough, into a domestic economy centre, for the Governors of the Newcomen Foundation. Deposit £5. Mr. L. M. Langston, clerk, 1, 2, 3 and 30 The Exchange, Southwark Street, S.E.

LONDON.—Sept. 23.—For erection of a residence for the medical superintendent and four workmen's cottages on the grounds adjoining their isolation hospital, World's End, Winchmore Hill, N., for the Enfield and Edmonton Joint Hospital Board. Mr. R. Collins, Public Offices, Enfield.

LONDON.—Sept. 25.—For constructing verandahs and for alterations to fire-escape staircases at the Brook Fever Hospital, Shooter's Hill, Woolwich, S.E., for the Metropolitan Asylums Board. Deposit £1 1s. Mr. W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, the office of the Board, Embankment, London, E.C.

LOUGHBOROUGH.—For the following structural alterations and fittings at the Technical Institute: (1) laying wood floor and fixing skylight to room in old library; (2) supply and fixing sink and accessories; (3) supply of six deal tables; (4) additions to heating (hot water) supply. The Principal, Technical Institute, Loughborough, Leic.

MANCHESTER.—Sept. 18.—For laying wood block floors in the sick ward of the male imbecile block at the workhouse at Crumpsall. Mr. A. J. Murgatroyd, architect, 23 Strutt Street, Manchester.

MEXBOROUGH AND MOORTHORPE.—Sept. 17.—The West Riding Standing Joint Committee invite whole tenders for the following works: New parade room at Mexborough police station, ditto Moorthorpe police station. Mr. J. V. Edwards, county architect, County Hall, Wakefield.

MICHELMERSH.—Sept. 24.—For erection of a corrugated iron cookery room at Michelmersh Council school, for the Hampshire County Council. Deposit £2 2s. Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

MONMOUTH.—Sept. 18.—For concreting the floors of two dining sheds and a guard hut belonging to the Royal Monmouthshire Royal Engineers (Special Reserve), in a field about a mile and a half from Troy Station, Monmouth. The Officer Commanding Royal Monmouthshire Royal Engineers (S.R.), The Castle, Monmouth.

NELSON.—Sept. 28.—For the construction of a brick skew arch bridge with stone facings over the river in Carr Hall Road, for the Corporation. Deposit £2 2s. Mr. W. Shackleton, A.M.I.C.E., borough engineer and surveyor, Town Hall, Nelson.

NORWICH.—Sept. 18.—For erection of children's receiving homes, superintendent's home, and stores on Hotblack Road, for the Guardians. Deposit £1 1s. Messrs. Morgan & Buckingham, architects and surveyors, 1 Upper King Street, Norwich.

PORTSMOUTH.—Sept. 16.—For rebuilding offices and other work at the Fratton Street Council school, for the Education Committee. Mr. A. H. Bone, surveyor, Cambridge Junction, Portsmouth.

REDCAR.—Oct. 2.—The North Riding of Yorkshire County Council Education Committee invite full tenders for erection of a cookery and manual instruction room at West Dyke Council school. Mr. Mennell, Cleveland District Education Office, Redcar.

ROCHE.—Sept. 21.—For certain alterations for the adaptation of the Temperance Hotel, Roche, Cornwall, for the purposes of a working-men's institute. Mr. B. C. Andrew, M.S.A., architect, Biddick's Court, St. Austell.

ROCHFORD.—Sept. 14.—For the work of alterations and additions to the female wards at the workhouse infirmary at Rochford, Essex. Send in names and addresses to the architect, Mr. W. J. Wood, 26 Alexandra Street, Southend-on-Sea.

ST. AUSTELL.—Sept. 21.—For erection of a new residence, South Street. Mr. B. C. Andrew, M.S.A., architect, Biddick's Court, St. Austell.

SCOTLAND.—Sept. 16.—For the concrete, joiner, slater, plasterer, plumber, and painter works of additions to Fog-watt Hall. Mr. McGillivray, printer, South Street, Elgin.

SCOTLAND.—Sept. 16.—For the mason, carpenter, slater, plumber, plaster, and painter works of new room to be

erected for manual work and physics, and refitting of shelter at the West End school, Elgin. Mr. J. Wittet, architect, Elgin.

Daniels & Rees . . . 1,548 0 0
Rees Davies . . . 1,519 0 0
THOMAS & Co., Llandilo (*accepted*) . . . 1,398 10 0**ELECTRIC LIGHTING—A YEAR'S PROGRESS.**

A LITTLE over a year ago the announcement was made of an invention which promised to revolutionise electric lamp making. The process of drawing the metal tungsten, hitherto regarded as a brittle and non-ductile substance, into lamp filaments as strong as steel had just been made a commercial possibility. The British Thomson-Houston Company, Ltd., one of the largest electrical manufacturing firms in the country, were responsible for the development of this process, which they embodied in the now famous Mazda Drawn-wire Lamp. The early promises of this invention have been fulfilled.

It may be well briefly to re-describe this invention. By the process employed in the manufacture of Mazda lamps pure tungsten is drawn into a fine wire with a tensile strength greater than steel. The drawn-wire filament is produced and used in one continuous length, thus ensuring a uniform diameter throughout, instead of the varying sections of the old pressed filament lamp. It is also possible to wind the continuous drawn filament on a flexible mounting, thus doing away with the rigid joints and supports necessary in a pressed filament lamp. As a result the drawn-wire filament is many times stronger than the old pressed filament, not only at the beginning, but throughout its life.

No sacrifice of efficiency has been made in the Mazda Drawn-wire Lamp—indeed, it is probably slightly more efficient than the pressed lamp—but its strength and durability enable it to be employed satisfactorily under conditions that would be impossible with the latter. At the present time it is being used on battleships during heavy gun practice, in tramcars and railway trains, in coal mines and factories, and in public buildings, shops, offices, and private houses all over the world.

The rapidity with which the new lamp has bounded into popular favour is noteworthy. Over 10,000,000 Mazda Drawn-wire Lamps were sold last year in all parts of the globe—and this after only a year's working of the process.

THE total membership of the Amalgamated Society of Carpenters and Joiners is officially announced at 75,979. There were last week 1,021 in receipt of unemployed benefit, 1,394 in receipt of sick benefit, and 2,644 in receipt of superannuation allowance. The executive also announced an advance of a halfpenny per hour in the wages of their members at Chepstow, Keighley, and Dumfries. At Langford their members had received 28s. per week for the present, that amount to be further increased to 30s. per week when existing contracts now in hand were completed.

MESSRS. PATMAN & FOTHERINGHAM, LTD., 100 and 102 Theobald's Road, W.C., also of Park Street, Islington, have recently been successful in securing the following contracts: Extension to Mayfair Works, Miles Street, South Lambeth Road, for Messrs. Brand & Sons; taking down and rebuilding front and other alterations at No. 70 Fleet Street, for Messrs. Sweetings, Ltd.; and new works and garage, &c., for the National Steam Car Co., Nunhead Lane, Peckham, S.E.

A NOVEL CONTINENTAL HOLIDAY COURIER.

RECENT events have endowed Germany with such peculiar interest to the English that many holiday makers desire to see something of that country. To those, however, not knowing the language there is the difficulty of finding out where to go and what to see with the minimum of expense and trouble.

A very commendable attempt has been made by the Great Central Railway Company to overcome this difficulty by the issue of a Continental courier for Berlin and Hamburg. Carried with ease in the vest pocket, it so maps out the tourist's time that his visit is made a round of pleasure combined with instructive and interesting experiences from the moment of arrival to the hour of departure.

The name of each point of interest is given in English and German, but the latter is phonetically spelt. The inclusion of a dictionary of every-day phrases, with their anglicised pronunciation, completes the brochure.

Copies may be obtained post free from the Great Central Railway Publicity Bureau, 216 Marylebone Road, N.W., or at any of Messrs. Dean & Dawson's offices.

MR. F. B. LEWIS, A.R.I.B.A., city architect, Nottingham, has resigned his appointment, owing to reasons of health. A native of Nottingham, Mr. Lewis completed his articles with the firm of Messrs. T. C. Hine & Son (the then agents for the Duke of Newcastle), and soon afterwards entered the service of the Council, where he has remained for twenty-six years.

MESSRS. BRUNNER, MOND & Co., the chemical manufacturers, of Winnington, Northwich, and other places, intend to erect a considerable number of workers' model dwellings, on the garden city principle, about their various estates in the Northwich district. As a temporary expedient, they will erect one hundred temporary dormitories, and fifty bungalows for married men in the Avenue, Winnington. In the meantime, a garden city architect is preparing plans of model dwellings.

THE Glasgow Corporation at their meeting on the 5th inst. adopted a recommendation that baths for Govanhill and Langside districts be erected on the north side of Calder Street, near Victoria Road, at an estimated cost of £29,000. The site extends to an area of about 2,750 square yards. Plans were submitted providing for two swimming ponds, thirty-six hot-water baths for males and eight for females, and Turkish baths for the accommodation of fifteen persons.

THE School of Art Wood-Carving, 39 Thurloe Place, South Kensington, which is under Royal patronage, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships in the evening classes maintained by means of funds granted to the school by the London County Council are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week, and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the Secretary.

THE Urban District Council of Spennymoor has received the sanction of the Local Government Board to the borrowing of money for a new sewage scheme. The work, which is to cost about £23,000, involves the laying of about 5½ miles of sewers and the construction of disposal works to deal with the sewage of a population of 18,000. The scheme has been designed by Mr. C. Franklin Murphy, A.M.I.C.E., of Morpeth, and is to be carried out under his supervision.

THE annual exhibition of the Royal Photographic Society is being held this year at the Galleries of the Royal Society of British Artists in Suffolk Street, Pall Mall, from September 2 till September 21. The premier Photographic Society has hung between six and seven hundred exhibits by home, foreign and colonial workers, and among them are many calling for careful study. Photography has by no means yet reached its Ultima Thule, and each year sees some advance made in technique or in artistic treatment, trifling, perhaps, in each instance, yet in the aggregate leading to marked improvement. The exhibition as usual is divided into two main sections, the pictorial and the scientific, and while the former is and always will be the more popular, it is in the latter that improvements are most frequently made and shown, to be afterwards adapted to the use of the more popular side of the art.

THE ARCHITECTURAL ASSOCIATION EXCURSION, 1912.

SHIRE HALL, SHREWSBURY.
C.E.B. 1912

Sketches by Mr. C. E. BATEMAN, F.R.I.B.A.

PRESERVATION OF SCENERY IN FRANCE.

IN every civilised country the ugly advertisement hoardings erected along the roads and railways, often amid the most beautiful scenery, have become an eyesore. The American Consul at Lyons gives some interesting information in a recent report to Washington as to the measures which the French authorities are taking to deal with the question. A heavy stamp tax is about to be levied, he says, on all signboards that can be seen from any public path, road, or railway. All such advertisements set up, except on the wall of a house or enclosure, or within 328 feet of any group of houses or buildings, will be taxed. The tax will be doubled if there are two advertisements together, trebled when there are three advertisements, and quadrupled for four or more.

Motorists, in particular, have campaigned against the wayside signboard, adds the Consul, and in some places here

restrictive measures have already been taken by the local authorities within their jurisdiction. Many people would like to suppress the signboard in rural districts altogether, but it is considered encroachment on the personal liberty of a landowner to prohibit him from allowing signboards to be erected on his own property. It is, however, possible, through legislative enactment, to impose a tax sufficiently high to diminish the quantity of signboards that are increasing in a disturbing manner in some of the most beautiful regions in France.

A GUILD has just been formed at Stratford-on-Avon to supplement and co-operate with all efforts, public or private, that may tend towards preserving the ancient characteristics and beauty of the town. The Mayor has been elected President.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

CHESHIRE.

Stockport.—Public library.
Post office.

CORNWALL.

Redruth.—Workhouse: Male infirmary: extension

CUMBERLAND.

Wigton.—New works for Messrs. Carr, White & Co.

DERBYSHIRE.

Borrowash.—Wesleyan Schools, King Street (£1,300).

DEVON.

Devonport.—Workhouse Infirmary: Doctors' Dispensary and Nurses' Home, &c.

House, plot 10, Hill Brow Road, for Mr. C. Roberts.

"Needwood," Hinton Road: additions for Miss Fiennes.

House, plot 283, Lowther Road, for Messrs. Lambert & Son.

Two houses, plots 41 and 42, Newstead Road, for Mr. E. G. Evans.

House, plot 176, Pine Road, for Mr. A. J. Curnow.

"Kinrara," Portarlington Road: additions for Mr. W. H. Thompson.

Pair houses, plot 250, Rebbeck Road, for Mr. J. Houston.

Two pairs of houses, plots 256 and 258, Roberts Road, for Miss Burridge.

House, plot 79, Stirling Road, for Mr. F. W. Beynon.

House, plot 149, Stronden Road, for Mr. H. W. King.

"Ballyhire," Walpole Road: additions for Mr. Harley.

"Arnewood," West Cliff Road: additions for Messrs. F. Hoare & Sons.

No. 8 The Square: additions for Mr. H. J. Tuson.

Three houses and shops, Christchurch Road, for Mr. J. Sainsbury.

Endowed High School for Girls, Norwich Avenue: additions for the Governors.

Cosham.—Sixteen houses, Knowsley Road.

HUNTINGDONSHIRE.

St. Neots.—Paper mill.

KENT.

Bromley.—Workhouse: additions and alterations (£15,000).

LANCASHIRE.

Bolton.—Electric power station, Back-o'-th'-Bank.

Eight houses, Abingdon Road, for Messrs. Leigh Brothers, Ltd.

House, Adelaide Street, for Messrs. Tootal, Broadhurst, Lee & Co., Ltd.

Twenty-five houses, off Eden Street, Astley Bridge, for Mr. W. E. Yates.

"The Grove," Chorley New Road: alterations for Colonel Musgrave.

Six houses, Georgina St., for Messrs. Hughes Bros.

Four houses, Woodstock Drive, Smithills, for Messrs. Leigh Brothers, Ltd.

"Stag's Head" Inn, Junction Road: alterations for Mr. Blackledge.

Premises, Lower Bridgman Street: extensions for Messrs. Hodgkinson & Gillibrand.

Premises off Hacken Lane: addition for Riversdale Weaving Co., Ltd.

Cotton Stores, Chorley Old Road, for Musgrave Spinning Co., Ltd.

Weaving Shed, Bury Road: extensions for Messrs. Rusden & Co.

Todmorden.—The "Fielden Hotel," Fielden Square: conversion into Conservative Club (£1,000).

LINCOLNSHIRE.

Alford.—Premises, High Street: alterations for Mrs. Small.

Lincoln.—Workhouse Infirmary.

MIDDLESEX.

Sunbury.—Six houses, Orchard Road, Park Road, for Messrs. Smith & Co. (of Walthamstow).

MONMOUTHSHIRE.

Newport.—Offices and stores, &c., for the Electricity and Tramways Departments (£6,250).

NORTHAMPTONSHIRE.

Northampton.—Girls' Secondary School.

NORTHUMBERLAND.

Alnwick.—"Hillcrest": additions; Mr. G. Reavell, A.R.I.B.A., architect. Also

Alterations at "Douglas House," Bondgate Within.

Annitsford.—Aged miners' cottages.

Heaton.—Picture Hall, corner of Biddlestone and Chillingham Roads (for 1,500 sittings). Messrs. White & Stephenson (of Newcastle), architects.

Whitley Bay.—Wesleyan Chapel: Hall and vestries (£820).

NOTTINGHAMSHIRE.

East Kirkby.—Council Schools for 400 places.

Nottingham.—Trent Swimming Baths: Refreshment room (£550). City architect.

Stoke.—St. Margaret's Church: restoration (£2,500).

Underwood (Selston).—Council Schools for 300 places.

SHROPSHIRE.

Billingley.—Thirty-six cottages.

SOMERSET.

Brislington (near Bristol).—Infants' Council School. Mr. A. J. Pictor, A.R.I.B.A. (of Bruton), architect.

Combe St. Nicholas.—Parish room.

STAFFORDSHIRE.

Hanley.—Church, Joiners' Square.*Hednesford*.—Miners' Rescue Station.*Stafford*.—Seventeen cottages, Marston Road, for Messrs. J. Morgan & Sons.

Four houses, St. George's Road, for Mr. A. Ancill.

Two houses, Sandon Road, for Mr. W. Skelthorne; also

Two houses, Weston Road.

Engineering School, Victoria Square, for the Education Committee.

Warehouse and stable, off Freeman Street, for Mr. W. Davies.

Working-class dwellings, Backwalls South (£3,200).

Wolverhampton.—Motor-cycle works, Pool Street, for Messrs. Marston, Ltd.

SUSSEX.

Chichester.—Children's Cottage Home, for the Guardians of the poor.

WARWICKSHIRE.

Erdington.—Picture Theatre, Coventry and Grange Roads corner.

Picture Theatre, Wilton Road and High Street corner.

WORCESTERSHIRE

King's Heath.—Picture Theatre, High Street and York Road corner.*Newton*.—Hospital alterations (£550).*Rowley Regis*.—Technical Schools at Wright's Lane Schools (£1,500).

YORKSHIRE.

Brighouse.—Public baths (£5,000).*Cawood*.—Wesleyan Chapel reconstruction. Mr. Birch (of York), contractor.*Hebden Bridge*.—St. John's Church (accommodation for 500 sittings), £6,500.*Hull*.—Tuberculosis Sanatorium for 100 beds (£15,000).

WALES.

Bargoed.—Two semi-detached houses at Aberbargoed. Mr. H. Caldwell, C.E. (of Blackwood, Mon.), architect.*Llanarmon (Denbighshire)*.—The Grianrhyd Council School.*Llandudno*.—Police buildings (£4,500). Mr. Holt, architect.*Pontypridd*.—Institution for the feeble-minded (£60,000).*Swansea*.—Tabernacle Baptist Chapel, Wheatfield Terrace: Schoolroom, cloakroom, &c.

Cinema hall and shop, St. Helen's Road, for Messrs. H. C. Behenna & Co.

Glynn Vivian Mission Hall, Pentremawr Road: additions.

SCOTLAND.

Airdrie.—Tuberculosis Hospital. Messrs. G. Arthur & Son, architects.*Dalbeattie*.—Board School: additions.*Dunfermline*.—The Hill House: additions and alterations for the Earl of Elgin (£4,000). Mr. F. W. Deas, M.A., F.R.I.B.A. (of Edinburgh), architect.*Gartcosh*.—School building, Lochend Road, for the Cadder School Board.*Kilbirnie*.—Board School at Newhouse.*Kilmarnock*.—Buildings, Bonnyton Road: alterations for the Ayrshire Coal Owners' Association (£750).

Smithy, West Langlands Street, for Messrs. Andrew Barclay, Sons & Co., Ltd. (£500).

Bonded warehouse, Strand and Croft Streets, for Messrs. John Walker & Sons, Ltd., distillers (£5,000).

Wool store, &c., Lawson Street, for Messrs. Douglas, Reyburn & Co. (£660).

Kirkcubbin.—Board School (£3,100). Mr. Crombie (of Dumfries), architect.*Kirkpatrick-Durham*.—Board School (£1,370).*Motherwell*.—Dalziel United Free Church, Mair Street (£5,000).*Rutherglen*.—Manse.*Scotstoun*.—Ten semi-detached houses, Park Drive North, for the Estate Building Company (£6,000).*Shettleston*.—Double cottage, Hallhill Road, for Mr. J. Stephen.

Block of houses, Croftspar, for Major G. R. Cruden.

Shieldhall (South Govan).—Scottish Co-operative Wholesale Society, Ltd.: extension of buildings in Renfrew and Maxwell Roads.*Stepps*.—Cottage, Whitehill Farm Road, for Mrs. S. Smith.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 21,697. Oct. 2, 1911.—Improvements in or relating to the manufacture of cement. J. G. A. Rhodin, 96 Albert Street, Camden Town, N. The object of this invention is to extract the potash from felspar with water after heat treatment with lime and common salt, leaving a slurry, which is wet with the salt solution, which slurry, subsequently with or without additional lime in a finely divided condition is converted in one firing into a white hydraulic cement at such a low temperature that no re-grinding is necessary. The reducing of the alkali salts to a minimum, and their distribution through the mass in the form of a solution, constitute the subject matter of this invention. Numerous experiments have shown, however, that treating felspar by certain known methods introduces serious manufacturing difficulties, and limits the usefulness of the resulting cement. 1. The mixing of a small quantity of salts with a large quantity of felspar and lime is very difficult when dry-grinding is used, and to obtain the desired effect excessive quantities of these contact substances must be used. Even then it is well nigh impossible to make the two charges fire alike, notwithstanding the most careful application of pyrometric control. Mixtures made on a commercial scale yield a very indifferent cement. The difficulty of dry-grinding is well known in Portland cement manufacture, and it has led to the abandonment of the "dry slurry" for the "wet slurry" process. 2. If the proportion of contact salts is sufficient to allow a cement to be made, then this cement contains such a quantity of soluble salts as to cause "sweating" in a moist atmosphere, and to make the surface peel off after prolonged exposure. 3. A cement made from "raw" felspar contains too high a percentage of alkalies to weather well. 4. Moreover, when working with commercial qualities, it is utterly impossible to make the heat permeate the mass of dry powder, since the latter is practically a non-conductor. In view of these difficulties, the inventor has introduced potash extractions, and altogether abandoned the dry slurry process. As one example: 100 parts of felspar, 56 parts of slaked lime, and 40 parts of common salt, all finely divided, are carefully mixed together and heated in the well-known manner to 900° or 1,000° C. for about one hour. The resulting mixture is lixiviated with hot water, the solution is run off for crystallisation, &c. The wet insoluble mass is washed with hot water till the wet slurry shows contents of chlorine corresponding to approximately 0.25 per cent. of common salt, calculated on the dry weight of the residue. In a suitable mixing-machine is placed a quantity of lime, sufficient to adjust the hydraulic modulus, and gradually add the slurry whilst the machine is running. The water slakes the lime, and the heat evolved evaporates most of the excess, which leaves as steam. By careful adjustment of the quantity of water a nearly dry mixture results, with the soluble salts absolutely evenly distributed on the rest. Working to a paste is also permissible. With the above-mentioned proportions, a thoroughly washed, dried, and carbonated "residue" has the average composition:—

Soluble in hydrochloric acid.	Silica (SiO ₂) insoluble	60
	Alumina (Al ₂ O ₃)	7
	Lime (CaO)	24
	Carbon-dioxide (CO ₂)	6.5
	Alkalies	2.5
		100.0

By far the greatest part of the lime is chemically combined with silica, and the "residue" itself has the nature of a chemical compound, closely allied to natural calcium-trisilicate (adelforsite of Hisingen) impregnated by kaolin. In gauging the necessary quantity of lime to be added one must calculate on a total of 45 to 55 per cent. CaO in the finished cement. Weighing the lime before slaking, this means adding to 100 parts of residue calculated as a dry substance, from 40 to 70 parts CaO.

MR. F. W. ROBERTS, F.R.I.B.A., Taunton, has been elected as surveyor to the Taunton Town Trust in the place of Mr. J. Houghton Spencer, architect, who recently resigned through failing health, after holding the appointment for forty-four years.

PATENT SPECIFICATIONS PUBLISHED SEPTEMBER 5, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 16,277. July 14, 1911.—F. E. Matthews, Ph.D., F.I.C., 7 Staple Inn, W.C. Manufacture and production of varnishes and paints.

18,249. Aug. 12, 1911.—W. E. Hipkins, Soho Foundry, Birmingham. Weighbridges.

18,277. Aug. 12, 1911.—Alphonse Reis, 7 rue de Bom, Antwerp, Belgium. Vapour burners. (Producing gas from petrol.)

18,334. Aug. 14, 1911.—Thomas Judd and L. V. Riley, 115 Holloway Road, N. Electrical heating element.

18,372. Aug. 14, 1911.—C. T. Robinson, 12 Lutwyche Road, Catford, S.E., and S. J. Prescott, 45 Church Street, Camberwell, S.E. Valves, for facilitating the repair thereof.

18,486. Aug. 16, 1911.—William Anderson, Scotia Villa, Newport, Fife. Ball water-cocks for cisterns and the like.

18,724. Aug. 19, 1911.—W. J. Lamb, 15 Dinorwie Road, Anfield, Liverpool, and J. H. Clegg, 16 Blenheim Road, Liscard, Cheshire. Valves and valve seats.

18,765. Aug. 21, 1911.—C. H. Sparks, 23 Avenue Road, Forest Gate, E. Gutter bracket and wedge.

19,734. Sept. 5, 1911.—Reginald Murgatroyd, 10 Stephen Street, Stockport. Non-scorching baking and cooking tray, for use in ovens and the like.

19,960. Sept. 7, 1911.—Franz Jordy, 27 Stralsunderstr, Berlin, and Carl Harting, 7 Eisenacherstr, Berlin. Method of generating gas.

20,757. Sept. 20, 1911.—S. Carter, 10 Cardwell Road, Garston, Liverpool. Means for separating and removing liquid impurities from gas.

21,026. Sept. 23, 1911.—C. M. Holmquist, 52 Regent Street, W. Electric heating apparatus.

22,565. Oct. 12, 1911.—J. W. Murray, 53 Rayleigh Road, Wimbledon. Folding seats, tables, and the like.

23,704. Oct. 26, 1911.—C. H. Mower and Waldemar Hessling, 147 Queen Victoria Street, E.C. Drying apparatus.

24,397. Nov. 3, 1911.—Peter Fyfe, 23 Montrose Street, Glasgow. Gas fires, ovens, and registers in which gas is used as fuel.

25,527. Nov. 16, 1911.—J. M. Butterfield, Wentworth House, High Road, East Finchley, N. Acetylene and other gas generators.

25,826. Nov. 20, 1911.—John Badger, 15 Summer Row, Birmingham. Locks and latches for sliding doors.

25,906. Nov. 20, 1911.—Geo. Clements, 445 Eaglewood Avenue, Chicago. Vacuum cleaners.

26,131. Nov. 22, 1911.—L. H. Teale, 1 Heathfield Terrace, Far Headingley, Leeds. Domestic fireplaces.

27,783. Dec. 11, 1911.—A. C. Manifold, 186 Lewisham Road, Lewisham, S.E. Machinery for grinding, rubbing, and polishing surfaces such as mosaic, terrazzo, parquet flooring and the like.

28,619. Dec. 19, 1911.—J. P. Clifton, C. C. Trow, H. C. Redfearn, and P. L. Marvin, Buffalo, Erie, U.S. Jet suction apparatus for vacuum cleaning or ventilating.

29,284. Dec. 29, 1911.—R. T. Johnson, Trent Sanitary Works, Stoke-on-Trent. Means for supporting lavatory basins.

2,617. Feb. 1, 1912.—W. J. Watkins, Fort Worth, Tarrant, Texas, and the Oxine Gas Manufacturing Co., of same address. Manufacturing carburetted gas.

3,351. Feb. 9, 1912.—Edward Richards, 7 Cart Lane, Temple, Bristol. Stays for swing-winlows, fanlights, and the like.

4,621. Feb. 23, 1912.—H. F. S. Phillpot, 24 Church Street, Kidderminster, and William Johnstone, Central Chambers, Kidderminster. Vacuum sweepers or dusting devices.

5,648. March 6, 1912.—Date claimed under International Convention, March 8, 1911. M. F. Hoffmann, 21A Lachswehr-Allee, Lubeck, Germany. Water-closets.

5,818. March 8, 1912.—A. R. Poole, 9 Langholm Crescent, Darlington. Distributing tank for use in systems of heating by liquid circulation.

6,112. March 11, 1912.—E. T. R. Murray, Erie, Radlett, Herts. Manually or otherwise operated electric switches with automatic releasing mechanism.

7,354. March 26, 1912.—F. J. Nice, 49 Lake Street, Pontiac, Oakland, Michigan, U.S. Heating furnaces.

9,152. April 18, 1912.—W. F. Green, Modesto, Stanislaus, California, U.S. Condensers for use in acetylene gas plant.

16,157. July 10, 1912.—Nederlandsche Belonyzerbouw A.G., 35 Haadhuistraat, Amsterdam, and Jan Mijs Nieuwe's Gravelandscheweg 57, Bussum, Holland. Method of making concrete impervious to liquids.

VARIETIES.

GLAMORGANSHIRE Guardians are considering a scheme for the establishment of central homes for the care and education of the feeble-minded. It is proposed to erect an institution at a cost of £60,000.

THE Barnsley Town Council on Tuesday adopted the recommendation of their Finance Committee that steps should be taken to provide municipal offices and a Town Hall.

THE Blackburn Town Council last week unanimously approved of an important town-planning scheme, embracing a residential area covering several miles, bounded by the Preston Road, Brownhill, and Revidge districts.

MR. A. E. CORBETT, F.R.I.B.A. (of the firm of Messrs. Woodhouse, Corbett & Dean, architects, Manchester) has accepted an appointment of Government inspector of technical schools in the North of England. A presentation of a gold watch and a gold-mounted fountain pen was made to Mr. Corbett last week in the rooms of the Manchester Society of Architects.

TRADE NOTES.

UNDER the direction of Mr. R. T. Longden, Lic.R.I.B.A., Stoke-on-Trent, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "Air-Pump" ventilators and air inlets, has been applied to Rudyard Chapel, Rudyard, Staffs.

MESSRS. JOHN TANNER & SON, of Westminster and Liverpool, have been engaged by Mr. Alfred Butt and Mr. Walter de-Freeze, of the Palace Theatre, Shaftesbury Avenue, and directors of numerous other theatres, to execute the whole of the fibrous plaster work and decorations at the new music-hall which is now being erected on the site of the old White City, at Newcastle, from designs of Messrs. W. & T. R. Milburn, architects, of Sunderland and Newcastle. The theatre is unique in character to the extent that it has neither dress circle nor gallery, and will be capable of seating 3,000 people.

MESSRS. JOHN WARNER & SONS, LTD., of the Spitalfields Foundry, London, N.E., are to supply and erect a new bell, weighing 6 cwt., note D, to be rung by electricity, at the Church of the Holy Spirit, Clapham, S.W. This method is entirely new. The entire absence of ropes and pulleys and noise is a great boon, to say nothing of the fact that the speed of the bell can be regulated at will to suit all tastes. The ring of six bells of Wallasey Parish Church, near Liverpool, are to be rehung by Messrs. John Warner & Sons, who recently erected the new ring at the Church of St. Nicholas, Wallasey.

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Failsworth, Manchester, are carrying out the following warming and ventilating contracts: The Church National Schools, Beccles, and the Sibertswold Schools, near Dover, are being supplied with Shorland's warm-air ventilating patent Manchester grates; the Irlam New Picture Palace, Manchester, is being ventilated by means of their patent exhaust roof ventilators and special inlet ventilators; and the new Isolation Hospital, Staines, Middlesex, is being supplied with patent warm-air ventilating Manchester stoves with descending smoke flues, patent exhaust roof ventilators, and special inlet ventilators.

THE Committee of the Old Boys of the Rothesay Academy, Isle of Bute, Scotland, are going to provide an illuminated clock, showing the time upon three large external dials and striking the hours and quarter chimes, which will be erected by Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle. The contractors are also making a clock for Gateshead-on-Tyne and a hour striking clock for Tydd St. Mary, on the Lincolnshire and Cambridge borders, and a clock for Messrs. Jackson & Co., Ltd., Anlaby Road, Hull. Messrs. Potts & Sons recently erected clocks at Askham Parish Church, near Retford, Notts; West Butterwick Church, Lincolnshire; Hartshead Church, near Brighouse, West Yorks; and the Joseph Rowntree Trust clock and bell at the Schools, New Earswick, near York; new church clock, Carlisle; and King Edward Memorial clock and bell, near Appleby, Westmoreland; Abbey Town, Cumberland. King Edward Memorial clock and bell; and Scarborough College, new clock and bell.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

Works: **FALKIRK, N.B.**

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

IRELAND.—Sept. 30.—The Governing Body of University College, Dublin, invite architects to submit designs for new college buildings. The competition is limited to architects living and practising in Ireland. Mr. H. T. Hare, F.R.I.B.A., has been appointed to act as assessor. Applications for conditions must be accompanied by a cheque for £2 2s., which will be returned on receipt of a bona-fide design. Mr. J. W. Bacon, M.A., Secretary and Bursar, 86 St. Stephen's Green, Dublin.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Coleshill Terrace, Llanelly.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ALTRINCHAM.—Oct. 7.—For the erection of a public convenience in Kingsway. Mr. H. E. Brown, surveyor, Town Hall, Altrincham.

LEE's "All Time" sheet lead and asphalt damp course has been specified and extensively used on the new Southmead Infirmary, near Bristol.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS.

THE school, which was first opened in temporary premises in Regent Street in 1896, was established by the London County Council to provide instruction in those branches of design and manipulation which bear on the more artistic trades. In September 1908 the school was transferred to the present building, erected by the Council, at the junction of Southampton Row and Theobald's Road.

Thorough training is provided in the arts and crafts, but admission to the courses of instruction in various handicraft subjects is, within certain limits, extended only to those actually engaged in handicraft. Every opportunity is given to students to specialise in relation to their own particular calling. The school is intended to supplement, rather than supersede, apprenticeship by affording to students engaged in London art industries fuller opportunities for design and practice in various branches of their craft than can usually be obtained in the ordinary routine of a workshop.

The instruction given falls into nine main groups, each so far as possible being accommodated on a single floor:—

1. Architecture and the Building Crafts (ground floor and basement).
2. Silversmiths' Work and Allied Crafts (first floor).
3. Book Production (second floor).
4. Cabinet Work and Furniture (third floor).
5. Drawing, Design and Modelling, including Life (third and fourth floors).
6. Needlework (fifth floor).
7. Stained Glass Work, Mosaic and Decorative Painting (fifth floor), including painting in tempera.
8. Day Technical Schools for Boys in—(a) Silversmiths' and Jewellers' Work; (b) Book Production.
9. The Royal Female School of Art. This school, established in 1842, is now under the control of the Council, and has been incorporated in the Central School.

The session is divided into two terms—namely, September 23, 1912, to January 31, 1913, and February 1, 1913, to June 28, 1913. The inclusive fee for the evening classes is £1 1s. a session; but there are reduced fees to journeymen and others, while persons under twenty-one years of age who are bona-fide engaged in trades are admitted free.

The teaching staff in the evening classes for Architecture and the Building Crafts is as follows:—

Architectural design and drawing, S. B. K. Caulfield, F.R.I.B.A., and S. Woods Hill, A.R.I.B.A.; building construction, F. H. Mansford; structural mechanics, P. J. Waldram, F.S.I.; woodcarving, George Jack and F. Stüttig; ironwork, A. W. Elwood; bronze casting, G. Fiorini; shaded drawing, A. D. Davidson.

There will also be classes in letter cutting in stone and inscription carving, and also in ornamental leadwork, provided there are a sufficient number of applicants.

The teaching in the architectural classes is arranged to enable students to qualify for the examination held by the Royal Institute of British Architects and other professional examinations.

SCOTTISH BUILDING TRADES FEDERATION.

THE eighteenth annual meeting of the Scottish Building Trades Federation was held at Inverness last week. Mr. J. Farquharson, Aberdeen, President of the Federation, occupied the chair. There was a representative attendance of delegates. The report for the past year stated that another very quiet year in the building trade had been experienced. Little or no improvement had taken place, and as far as could be ascertained there was no sign of immediate revival. Relations with the operatives had been satisfactory. There had been a general increase in wages throughout the country, due to a great extent to the increased cost of living. Consideration of the working of the Workmen's Compensation Act was taken up with a view to an inquiry to prevent the abuses which had arisen. The subject, also under the consideration of the Industrial Council, as to how far and in what manner agreements which were made between representative bodies of employers and of workmen should be enforced throughout a particular trade or district, was dealt with by the meeting. Other subjects upon the agenda included the consideration of Government contract conditions and sole contracting. The financial report submitted by the Treasurer was approved of, and thereafter the following office-bearers for 1912-13 were appointed:—President, Mr. James Gray, junr., Inverness; Vice-president, ex-Bailie Forrest, Edinburgh. Mr. T. Ferguson, solicitor, Edinburgh, was re-elected secretary and treasurer.

CALCUTTA CITY ARCHITECT APPOINTMENT.

THE Corporation of Calcutta invite applications for the post of city architect and surveyor, on a salary of 1,350 rs., equivalent to about £90, per month, inclusive of travelling and other allowances. The duties of the post will be to (a) design and superintend the construction of all municipal buildings; (b) generally supervise the Building Department and give advice regarding plans to which objection has been taken; (c) personally sanction and check the construction in cases of large and important buildings; (d) control and advise on the general scheme of architecture throughout the town, with a view to securing harmony of design, dealing incidentally with questions of town planning, street improvement, &c.; and (e) to perform the duties incident to his post as municipal surveyor.

The selected candidate will be required to devote his whole time to the duties of his office, and will not be allowed to take up any outside work. He will be required to submit to a medical examination before joining his appointment. The Corporation will pay his passage (first class) from London. He will be required to take up his appointment by about January 1, 1913.

Applications will be received in England by the Hon. Mr. S. L. Maddox, C.S.I., I.C.S., Chairman of the Corporation of Calcutta, East India United Service Club, 16 St. James's Square, London, S.W.

PARIS CHEAP DWELLINGS COMPETITION.

THE city authorities of Paris have, according to *La Construction Moderne*, arranged important separate competitions for the design of two groups of cheap dwellings. The first project deals with a site in the Avenue Emile-Zola, the rue Nouvelle, and the rue de Javel, and which comprises 2,425 square metres; the second site is in the rues Henri-Becque and Brillat-Savarin, and has a superficial area of 1,408 square metres.

The first competition includes five types of dwellings arranged as follows:—

Type No. 1.—An apartment combining a dining-room and a kitchen, or a dining-room and a kitchen separate, a bedroom for the parents, three bedrooms for children, water closet, and hall. The minimum area to be 55 square metres.

Type No. 2.—The same arrangement, but with two children's bedrooms. The minimum area to be 45 square metres.

Type No. 3.—The same arrangement, but with one children's bedroom. The minimum area to be 35 square metres.

Type No. 4.—The same arrangement, but without any children's bedroom. The minimum floor area to be 25 square metres.

Type No. 5.—One room and a small kitchen. The minimum area to be 18 square metres.

The annual rent of these dwellings must not exceed 550 francs, 500 francs, 400 francs, 300 francs, and 200 francs respectively.

The second project is for dwellings comprising at least a common hall which would serve as both a dining-room and a kitchen, and a large room capable of being divided by a partition in order to form two rooms. The minimum area of each dwelling to be 30 square metres. The rent must not exceed 275 francs a year.

The author of the selected project will either be entrusted with the execution of the work or will receive a premium of 15,000 francs for the first competition and 10,000 francs for the second.

In addition, the following awards will be given:—

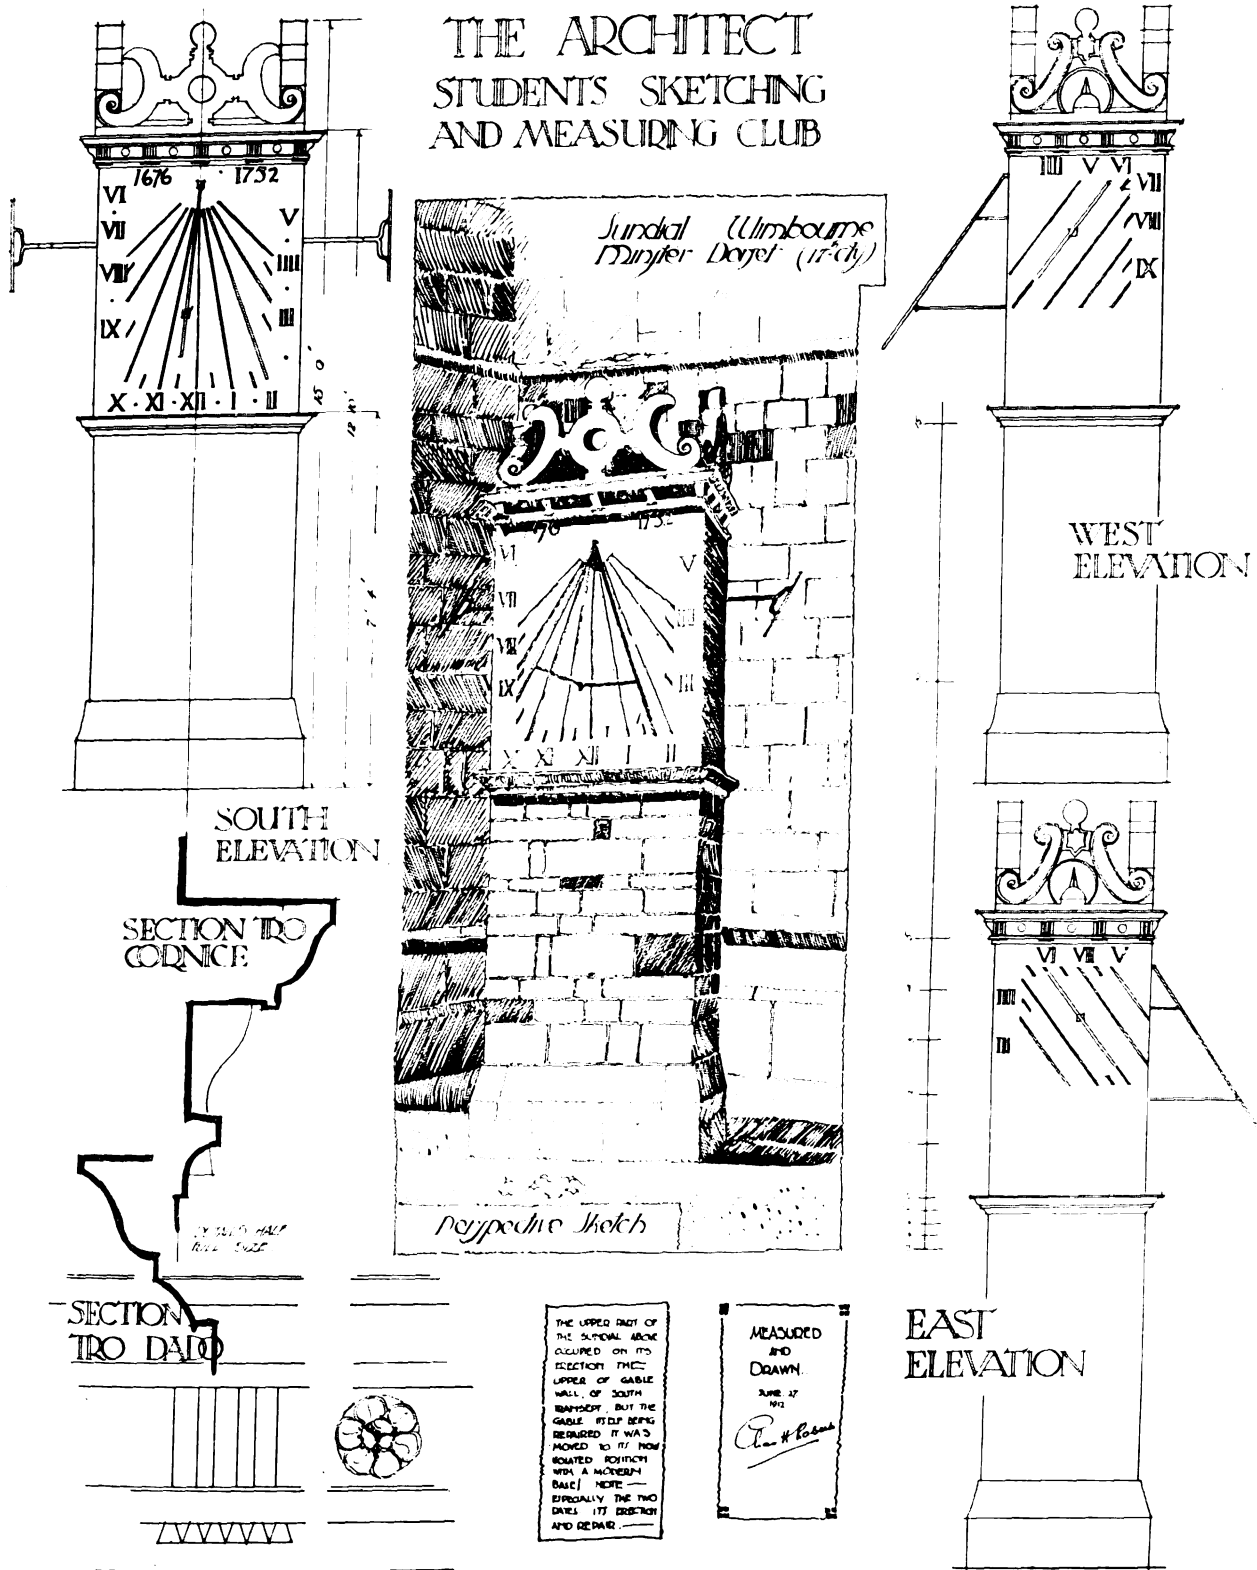

First competition: Second prize, 8,000 francs; third prize, 7,000 francs; fourth prize, 6,000 francs; fifth prize, 4,000 francs.

Second competition: Second prize, 6,000 francs, and three other prizes of 5,000, 4,000, and 3,000 francs respectively.

The competition closes on January 20, 1913.

A PICTURE PALACE, to accommodate about 1,000 people, is to be erected at Leigh, Lancs., in a central position of the town. Building operations will proceed at once. Messrs. J. C. Prestwich & Sons, of Leigh, are the architects.

THE late Mr. D. H. Burnham left a fund of \$50,000 for the establishment of a library of architecture at the Art Institute, Chicago. This was the sole public bequest contained in the will, disposing of an estate estimated at \$1,300,000. The fund will be used by the Art Institute in purchasing books on architecture at its discretion.

RENTS IN PARIS AND MADRID.

An American Consular report says, concerning the rise in Paris rents:—"During the period from 1890 to 1911 the population of Paris increased 455,173, or 19 per cent. During the same time the number of dwellings increased 182,836, or 22 per cent. It would appear at first glance that the number of vacant dwellings must necessarily have increased, but the contrary is true. The number of vacant dwellings in 1890 was 4.62 per cent. of the total number of dwellings in the city; in 1911 it was less than 1 per cent. of the total. This result, which at first seems abnormal, is said to be due to the decrease in the number of deaths and the increase in the number of single men. The great diminution in the number of dwellings is a cause of concern to the inhabitants of Paris, and one of the chief causes of the existing high rents. True, many dwellings are constructed each year in Paris, but the number demolished is almost as great; and, owing to the legal height limit of buildings, there is little or no more room in the new structures than in the old. It

is feared that if the population of Paris should increase in the same proportion—that is, 20,000 per year—and absorb each year, as in the period of 1901-11, 1,500 vacant dwellings, in five or six years there would be no more vacant dwellings, and owing to the natural law of supply and demand the inhabitants of Paris would find themselves facing two alternatives—to submit to the exactions of the property owners, or to move outside the city."

The report mentions that living is more expensive in Madrid than in any other city in Spain. Rents are about 50 per cent. higher, and other things about 25 per cent. This is easily accounted for by the fact that nothing is raised in the vicinity of the city, and that it is the home of practically all the wealthy people of the kingdom. Sanitary conditions in most parts of the city are excellent, and the older portions are rapidly being brought up to date in this respect. Large modern apartments cannot be had under £240 per annum, and there are few at that price. Modest apartments may be had as low as £150, and the most luxurious cost about £1,000.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

CHESHIRE.

Northwich.—Model dwellings for Messrs. Brunner, Mond & Co.

CORNWALL.

Lostwithiel.—Territorial Drill Hall, near the Parade.
Trevone.—Mission Church and curate's residence.

CUMBERLAND.

Carlisle.—Bakehouse, Bread Street: additions for Messrs. Carr & Co.

Thirty-nine self-contained dwelling-houses, Duke St. Post Office, Warwick Road.

Warehouse, Nelson Street, for Messrs. Buck & Sons.

Holme Head.—Additions to mills, for Messrs. Ferguson Brothers.

DERBYSHIRE.

Alvaston.—Council Offices.

DEVON.

Newton Abbot.—Hospital: Children's ward for eight beds.

Torquay.—Holy Trinity Church: parish room. Messrs. Watson & Watson, architects.

DORSET.

Poole.—Eleven cottages, Skinner and Pound Streets. Messrs. Bacon & Curtis, architects.

DURHAM.

Brancepeth (North) and Browney.—Council Schools: additions and alterations.

Chester-le-Street.—Infectious diseases hospital: new pavilion (£2,400).

Durham.—Workmen's dwellings.

Easington Colliery.—The Church of Ascension and Church Institute (£450).

Hetton.—Alterations to house, Pemberton Bank, for Mr. Logan.

Seventeen houses, Houghton Road, for Mr. J. Storey.

Alterations to houses, High Street, for Mr. Hudson.

Two houses, Church View Villas, for Mr. Place.

Stables and sheds, for the Co-operative Society.

Houghton-le-Spring.—House and shop, Bankhead, for Mrs. Davison.

Kelloe.—Primitive Methodist Church: vestries, schools, &c. Mr. J. W. Hayes (of Wingate), architect (£500).

Messrs. Regan Brothers (of Trimdon), contractors.

New Herrington.—Two villas, near St. Aidan's Church, for Mr. G. Cairns.

South Shields.—Workhouse, West Harton: extensions.

Mr. J. H. Morton, F.R.I.B.A., architect.

Sunderland.—St. John's Church Institute (£850).

HAMPSHIRE.

Bournemouth.—Congregational Church, Winton. (Accommodation for 650.) £5,000.

House, plot 25, Chessel Avenue, for Mr. J. Wright.

Two houses, plots 27 and 29, Seaward Avenue, for Mr. J. Houston.

House, plot 205, Berwick Road, for Messrs. A. Lambert & Son.

"Cliff Cottage," Wilfred Road: additions for Mr. J. M. Mackelvie.

"Oxford," Wolverton Road: additions for Mr. S. E. Jones.

Yateley.—"The Dog and Partridge" Inn: re-construction.

KENT.

Ashford.—Factory extension, Birling Road, for the Ashford Underwear Company.

Two houses, King's Avenue, for Mr. S. Howland.

No. 26 Albert Road: additions for Mr. W. F. B. Jemmett; also

Two houses, Jemmett Road.

Two houses, Hythe Road, for Messrs. Hinton & Paine.

Lodge, Beaver Lane, for Mr. G. F. Davis.

Leeds.—Three houses, Church Hill.

LANCASHIRE.

Blackburn.—Wesleyan Central Hall (£20,000).

Blackpool.—Public swimming baths: additions (£11,000).

LINCOLNSHIRE.

Louth.—Public Bath (£660).

NORFOLK.

Great Yarmouth.—Receiving Home, near Clarence Road. Messrs. Olley & Haward, A.R.I.B.A., architects.

Thetford.—Workmen's dwellings, Bury Road. Mr. S. J. Wearing, A.R.I.B.A. (of Norwich), architect.

NORTHAMPTONSHIRE.

Kettering.—Co. Exchange, Market Place: alterations. Garage, London Road: additions for the Pytchley Garage Co., Ltd.

Two houses, Kingsley Avenue, for the Industrial Co-operative Society, Ltd.

St. Gabriel's House, Broadway: Memorial Chapel for the Committee.

House, Tresham Street, for Mrs. H. Bosworth.

Offices, Union Street: extension for Mr. S. Patrick.

NORTHUMBERLAND.

Newcastle-on-Tyne.—Jewish Day School.

NOTTINGHAMSHIRE.

Retford.—St. Alban's Church: extension.

SOMERSET.

Taunton.—Twelve workmen's dwellings, String Lane. Borough surveyor.

STAFFORDSHIRE.

Bucknall.—Relief Office for the Stoke-upon-Trent Guardians.

Burton-on-Trent.—Christ Church: restoration (£1,500).

Stafford.—Eight houses, Oxford Gardens, for Mr. W. Skelthorne.

Two houses, Weston Road, for Messrs. Degg & Butters.

One pair of semi-detached villas, Corporation Street, for Mr. H. J. Clay.

Stoke-upon-Trent.—Workhouse Infirmary: Nurses' Home extension and Children's Pavilion.

Wolverhampton.—Messrs. Chubb's Safe Works, Wednesfield Road: extensions.

SURREY.

Richmond.—Dairy, Burdett Road. Messrs. Worsfold & Hayward (of London), architects.

"The Bungalow," Manor Road: additions. Messrs. Brewer, Smith & Brewer, architects; also

House, North Road; and also

No. 18 George Street: addition.

No. 2 St. Helena Terrace: additions for Mr. J. L. Middleton.

Three shops, George Street, for Mr. R. L. Pearce.

Weybridge.—Post Office, High Street and Elm Grove Road. Mr. F. J. Privett (of Southsea), contractor.

SUSSEX.

Bognor.—Sixty-four workmen's cottages.

House, Annandale Avenue, for Mr. Briggs.

Two houses, Nyewood Lane, for Mr. Fulford.

House, Nyewood Lane, for Mr. W. P. Pepper.

Brighton.—Convalescent Home, King's Cliff (£8,000).

Chichester.—Cottage Homes for the Board of Guardians, Stockbridge Road.

Cuckfield.—Workmen's cottages, London Road.

Firle.—Gage Memorial Reading-room.

WORCESTERSHIRE.

King's Heath.—Picture Theatre, Ladypool Road.

Pinvin.—Working-class dwellings.

YORKSHIRE.

Barnsley.—Municipal Offices and Town Hall, Church Street.

Leeds.—Municipal Offices.

WALES.

Llandudno.—Petty Sessions House and Police Headquarters, Oxford Road (£5,000).

Neath.—Conversion into business premises at Melincrythan, for the Briton Ferry Co-operative Society. Mr. H. A. Clarke (of Briton Ferry), architect.

Port Talbot.—Nine houses, Abbey Road, for Mr. A. James.

Six houses, Taibach, for Mr. W. Miles.

Ruthin.—Infirmary for the Workhouse.

SCOTLAND.

Cathcart.—School for defective children, Craig Road. Four tenements, Rannoch Street.

Dundee.—Royal Infirmary: Porter's Lodge and other works (£1,800).

Giffnock.—Villa, Greenhill Avenue, for Messrs. George Dixon & Sons.

Glasgow.—Theatre de Luxe, 421 Sauchiehall Street: additions and alterations.

Greenock.—Two hundred workmen's houses.

Hamilton.—Municipal Offices (£13,000).

Johnstone.—Public School, Elderslie: additions for the Paisley Landward School Board.

Kirkwall.—St. Magnus' Cathedral: restoration (£35,000).

SCOTLAND—continued.

Newton Mearns.—Public School: additions.
Pollokshaws.—Three tenements, Factory and M'Arthur Streets (£9,000).
Port Glasgow.—Fourteen tenements, Mary Street.
Saltcoats.—Ayrshire Consumptive Sanatorium: extension for twenty additional beds (£2,100).
 Theatre for 1,000 sittings, Hamilton Street (£2,000).
Wick.—Slaughter-house, Green Road (£1,700).

IRELAND.

Bray.—Working-class dwellings (£10,000).
Lismore.—Roman Catholic Church, Ballysaggart.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 18,384. Aug. 14, 1911.—Improvements relating to the building of concrete, cement, and like walls. William Calway, managing director of the Building and Estates Development Co., Ltd., 40 Archfield Road, Bristol. The inventor has before proposed to use for the purpose of constructing a concrete, cement, or like wall *in situ* and step by step a mould consisting of a stationary end-plate and side cheeks adapted to be expanded from and contracted towards said end-plate parallel to one another. In this invention a mould is used consisting of the above-mentioned essential parts, but the shape of the core is modified so that iron bonds or wall ties can be used. Figs. 1 and 2 are end views of a mould, fig. 1 showing the mould contracted and fig. 2

the mould expanded. Fig. 3 is a plan of said mould, and fig. 4 is a vertical section, on the line a-b of fig. 3, showing the shape of core now proposed to be used; 1 is the stationary end-plate of the mould, and 2 are the side-cheeks which are adapted to be expanded from and contracted towards the end-plate 1 parallel to one another. 3 is a core secured to the stationary end-plate 1. The core 3 is made of rectangular

shape, as shown in fig. 4. Iron bonds or wall ties 4, which are dropped at their central parts so as to accommodate a guide rail 5 and its timber support 6, are incorporated with the wall, thus enabling transverse concrete bonds to be dispensed with. The core 3, which would during the building of the different courses bear with its bottom edges against the edges of the cavities formed in the walls, is provided on its bottom face with a longitudinal groove for the accommodation of the upstanding web of the guide rail 5, and the end-plate 1 is cut away at 1x for the same purpose. In the case of walls of certain thicknesses two or more cores would be used. 7 is a rod which is passed through and fixed to the centre of the stationary end-plate 1 by means of a pin 8, and is provided at its ends with screw threads 9. 10 are nuts of loop shape, engaging with the screw threads 9 and bearing against the outer faces of the side-cheeks 2. 11 are plain rods which are secured by means of pins 12 to the end-plate 1 and, passing through corresponding holes formed in the side-cheeks 2, serve as guides for ensuring movement of the side-cheeks 2 parallel to one another. 13 are coiled springs which are housed in recesses 14 provided in the end-plate 1 and press against the side-cheeks 2, and thus constantly tend to expand or move towards the side-cheeks 2. Aug. 14, 1912.

PATENT SPECIFICATIONS PUBLISHED
 SEPTEMBER 12, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

- No. 18,511. Aug. 16, 1911.—R. H. Hutchinson, 98 Leith Mansions, Maida Vale, N.W. Footlight floats and the like theatre lighting appliances.
 24,668. Nov. 6, 1911.—William Schmahl and Magic Appliances, Ltd., both of 6 Farringdon Avenue, E.C. Electrically operated portable vacuum cleaners.
 27,862. Dec. 12, 1911.—Edgar Booth, 9 Heath Villas, Halifax, and N. R. Booth, 44 Manor Heath Road, Halifax. Series systems of incandescent lamp lighting.
 18,936. Aug. 23, 1911.—Date claimed under International Convention Aug. 30, 1910. Blaugas Patentgesellschaft, m.b.H., Augsburg, Germany. Manufacture of liquid illuminating gas.
 19,031. Aug. 24, 1911.—Sir Bradford Leslie, K.C.I.E., 5 Chester Gate, Regent's Park, N.W. New drawbridge.
 19,041. Aug. 24, 1911.—R. H. Hillman, 14 Vanguard Terrace, Keyham, Devonport. Automatic closing apparatus for doors and casements.
 19,867. Sept. 6, 1911.—A. W. Rammage, 59 Schubert Road, East Putney. Concrete building construction.

 20,619. Sept. 18, 1911.—H. J. Jarrett, Maitland, South Australia. Rivets.
 20,718. Sept. 19, 1911.—John Ball, 4 Crossley Terrace, Liverpool Road, N. Electric shade carrier tongs.
 21,572. Sept. 30, 1911.—Edgar Rhodes, The Briars, Scholes, near Leeds, and the Romapac Tramway Construction Co., Ltd., 2 East Parade, Leeds. Machines for fixing and cutting off the upper or wearing portions of combined tramway rails.
 21,671. Oct. 2, 1911.—Leonard Percival, 762 C. St. Tacoma, Washington, U.S. Locks or latches.
 21,772. Oct. 3, 1911.—J. R. Quain, Dacre House, Victoria Street, S.W. Alarms for preventing theft.
 22,183. Oct. 9, 1911.—John Berry, 106 Pitt Street, Oldham; W. T. Glover, 37 Grasmere Road, Oldham; and Meters, Ltd., 6 Mawson Chambers, Deansgate, Manchester. Valves for controlling gas and other fluids.
 23,204.—Oct. 20, 1911.—J. H. Woolliscroft, Shanklin, Grosvenor Avenue, Great Crosby, Liverpool. Door or gate checks.
 24,017. Oct. 30, 1911.—Leonard Newitt and F. P. Fletcher, both of H.M. Dockyard, Chatham. Electrical heating or cooking apparatus.
 1,466. Jan. 18, 1912.—C. A. Brinley, 247 South Sixteenth Street, Philadelphia. Pulleys.
 5,987. Oct. 5, 1911.—Copeman Electric Stove Co., Flint, Michigan, U.S. Controlling means for electric cooking apparatus.

NEW LONDON SHOWROOMS.

To the fact that still with most people "seeing is believing" London owes not a negligible part of its present commercial importance. It may not now be necessary for the detailed processes of industry to be executed under the eye of the purchaser, but it is necessary for its results to be on view. Without her showrooms London would certainly lose much of her attractiveness, and sink back into a kind of monstrous parochialism. Fortunately, there is no fear of that, for the metropolis is yearly becoming more and more the world's market place and business depot. A representative in London has for long been an essential part of every progressive British firm; nowadays such a representative is usually supported by a showroom. That simple process of development has been followed by Messrs. Hartley & Sugden, Ltd., of Halifax, who have just changed their office in Queen Victoria Street, E.C., for excellent showrooms and offices conveniently situated at 61 Great Portland Street, W. Here they are now prepared to talk "heating" business to architects, engineers and contractors, and also to initiate the layman into the mysteries of this branch of engineering.

The firm have been making boilers for a very large number of years. Their success is to some degree attested by the sixty-five gold and silver medals awarded to them, to a still further degree by the long lists of contracts they have executed, and most of all by their high reputation among their own craft. The "White Rose" cast-iron sectional boiler was, if we remember right, first put on the market nearly ten years ago. It commenced with Series "A," and has now reached Series "M 2." It is claimed that each possesses maximum heating powers, with a minimum consumption of fuel. Series "M 2" is an ingeniously arranged low-pressure steam boiler which if of four sections has a heating power, direct radiation, of 525 square feet, and if of nine sections gives 1,275 feet of radiation. These figures are considerably excelled by Series "H."

Various types of independent boilers for hot water supply are on view. Messrs. Hartley & Sugden are makers of range boilers; but they strongly advocate that where installed the ordinary range boiler should be removed, the cavity bricked up, and an independent boiler substituted. Among the types shown are the "Savile," "Malvern," "Vedette," and the "Domestic Heater." These cater for small as well as large installations from 38 to 2,240 gallons per hour.

The visitor to 61 Great Portland Street should be careful not to leave before inquiring into the small apparatus actually heating the showrooms. It has not yet received a name, but doubtless will soon do so—we would suggest "The Success." On the ground floor is an unobtrusive boiler (which may also be used as an open fire) from which are fed radiators in the basement below, as well as on the same floor, or as high as is necessary. The boiler will burn from ten to fifteen or even twenty hours without attention; it fits in the same size opening as the previous small register grate, and its pipes, of half the usual diameter, satisfactorily heat four good-size radiators. All this is accomplished by a patent arrangement in the water tank.

MR. J. CAMPBELL REID, A.R.I.B.A., late lecturer in the Technical College, Paisley, was entertained last week to a complimentary dinner in Glasgow. Mr. Reid has received an appointment as chief of the architectural section of the Northern Polytechnic Institute, London, and left on Saturday last to take up his new position.

A START has been made this week with the new sewerage scheme, which is to embrace all the Matlocks, Cromford, and adjacent districts, the commencement being at the outfall works, which are three miles below Matlock, near Lea. The scheme is to cost over £40,000.

THE Titan Lift Co., Ltd., will on and after Monday next have their offices at 9-11 Eagle Street, Holborn, W.C. A move from their former premises has been rendered necessary by the increase of business. In their new premises a Titan lift has been installed, running from the bottom to the top storey.

WE announce with regret the death in his seventy-seventh year of Mr. George S. Guy, which took place at his residence, "Rose Bank," Great Malvern, on Saturday last. Mr. Guy was chairman of Messrs. James Russell & Sons, Ltd., Crown Tube Works, Wednesbury. The deceased was a county magistrate for Staffordshire, and was for many years a member of the Staffordshire County Council.

VARIETIES.

THE Bradford Corporation Libraries, Art Gallery, and Museums Committee recommend the Council to acquire a site for a branch library in the Otley Road district.

A GERMAN firm of silk manufacturers are negotiating for a site of about nine acres at Beverley, on which they intend to erect mills.

THE Buxton Lime Firms Co. propose to erect extensive cement works between Dove Holes and Peak Forest for the manufacture of cement out of the waste product from the lime works.

MR. ROBERT CAMM, Mr. Walter H. Camm, and Miss Florence Camm are continuing the business in stained glass and mosaics carried on for many years by Mr. Thomas William Camm at Smethwick, Birmingham.

MESSRS. TENNANT & BARRS, engineers, Newcastle, have prepared a scheme for the installation in the Scarborough workhouse of hot water heating and service systems upon the centralised system, and electric lighting installation, and for installing of a water-softening plant at the laundry. The scheme, which is estimated to cost £5,150, has been deferred.

THE proposal to extend the Batley Electricity Works, at a cost of about £20,000, has given rise to much controversy. A strong section of the Town Council are in favour of buying current from the Yorkshire Power Company rather than incur new capital expenditure on generating plant. The Electricity Committee are going to call in an independent adviser.

H.M. TRADE COMMISSIONER for South Africa reports that the Johannesburg Municipal Council, having at their disposal for the purpose of building an art gallery £36,168 out of the £110,000 required, have now agreed to tenders being invited for the erection of two wings at a cost of £30,000, or of three wings at a cost of £45,000.

THE Orsett (Essex) Rural District Council invite competitive scheme or schemes for proposed sewerage and sewage disposal for the parish of South Ockendon. The population of the parish (1911) is 1,330. Assessable value for special expenses, £3,705. The Council offer premiums of £50 for the scheme placed first and £25 for the scheme placed second by the assessor, who has been nominated by the Institution of Civil Engineers. Conditions can be obtained from Mr. J. Beck, clerk, 2 Orsett Road, Grays, and schemes must be delivered to him not later than January 1.

MR. GEORGE WILSON, architect, of Messrs. Sydney Mitchell & Wilson, Young Street, Edinburgh, died on the 16th inst. at St. Andrews. Mr. Wilson had been in indifferent health for some time. He was long and honourably associated with the profession in Edinburgh, first in the capacity of assistant to Sir Rowand Anderson, and later as partner with Mr. Sydney Mitchell, with whom he co-operated in carrying out the numerous works undertaken by that firm. During the past few years he did not take an active part in business matters.

THE Roscrea No. 1 Rural District Council invite experienced sanitary engineers to submit plans, specifications, and estimates of a complete sewerage system for the town of Roscrea by November 1. Should the Council, after full consideration of the plans and of the estimates of the proposed sewerage scheme, decide not to undertake same, twenty guineas will be paid for the best plan, &c. Should the Council decide to proceed with the work, the twenty guineas mentioned will not be paid, but the engineer who submits the approved plan, &c., will be employed as engineer at a remuneration of 5 per cent. on the total contract. The employment, of course, will be subject to the sanction of the Local Government Board.

IN Liverpool, as in many other centres, there has been for some months past considerable dissatisfaction among certain sections of men engaged in the building trade. Negotiations have been in progress between the Liverpool Master Builders' Association and the District Committee of the Navvies, Builders' Labourers, and General Labourers, and have, after two conferences, just terminated in a manner satisfactory to both sides. The men, according to the *Liverpool Courier*, have gained increases in the rates of pay, and rules have been fixed for the payment of overtime at advanced rates. A minimum of 6d. an hour for navvies and labourers has been agreed upon, and overtime is to be paid at the rate of time and a quarter for the first four hours and time and a half afterwards. Work done on Saturday afternoons is to be paid for at the rate of time and a quarter for the first two hours, time and a half till Saturday midnight, and double time to 6 A.M. on Monday. Christmas Day, Good Friday, and Bank Holidays count as Sundays, double time being paid.

THE Architect and Contract Reporter.

FRIDAY, SEPTEMBER 27, 1912.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

P. A. GILBERT WOOD,

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Sept. 30.—The Llanelly Education Committee invite competitive designs and estimates for erection of boys', girls', and infants' school buildings for over 1,000 children, and also a domestic subjects centre, at Stebon Heath Terrace, Llanelly. Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle Street, Cardiff, will act as assessor. Full particulars of the competition will be issued on sending application and £3 3s. deposit to Mr. Ifor W. Watkins, clerk, Education Offices, Colleshill Terrace, Llanelly.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ALTRINCHAM.—Oct. 7.—For the erection of a public convenience in Kingsway. Mr. H. E. Brown, surveyor, Town Hall, Altrincham.

A JOINT deputation of the Fulham, Battersea and Wandsworth Borough Councils will shortly petition the London County Council to substitute a larger bridge for the present Wandsworth Bridge, which is closed to heavy traffic.

UNIVERSITY COLLEGE, DUBLIN.—CHAIR OF ARCHITECTURE.

THE following communication has been issued by the Royal Institute of Architects of Ireland:—

The founding of a Chair of Architecture in the National University, although a matter unlikely to attract much public attention, is a factor in the national life of Ireland which should not be overlooked. For many years several of the British Universities have had their Architectural Schools, but in this country the necessary means for the thorough training of a potential architect have hitherto been lamentably deficient. The educational efforts of the few professional societies, productive, as they have been of late years, of much good, naturally cannot approach in value the systematic instruction obtainable at a properly equipped University. Irish architects have, therefore, laboured under considerable initial difficulties, when compared with their professional brethren elsewhere, and it speaks well for their inherent ability that they have been able to more than hold their own in competition with their more happily circumstanced colleagues.

The new School of Architecture, under the guidance of Professor Scott, should go far to fit the student for his arduous career and for those responsibilities towards the public which are his, in a marked degree, and should materially help to train him in the multitudinous branches of specialised knowledge essential to the equipment of the modern qualified practitioner. One feature of the Irish School is unique in that no student can obtain his architectural degree without having previously served a term in an architect's office, thereby learning how to convert his theoretical acquirements into actual practice. The insertion of this proviso in the University Regulations proves how carefully the subject was considered by the Governing Body.

In order to emphasise the establishment of this School of Architecture, and to mark a departure so intimately connected with the progress of National Art, we are informed that the Royal Institute of the Architects of Ireland are convening a public meeting at 4 o'clock P.M. on Tuesday, October 15, in the Lecture Theatre of the Royal Dublin Society, at which his Excellency the Lord Lieutenant has intimated his intention of being present.

AN EXTENSIVE WATERWORKS FILTRATION SCHEME.

BETWEEN the Wessenden Valley reservoirs of the Huddersfield Corporation and the Woodhead reservoirs of the Manchester Corporation is the watershed of the Ashton, Stalybridge, Mossley and Dukinfield Joint Waterworks Board. In the valleys at Greenfield, Chew and Swineshaw are seven or eight huge reservoirs, which supply water to a population of 140,000 people, distributed over an area of fifty-two square miles. For some years past complaints of lead poisoning were prevalent, and to remedy this the Board undertook a scheme of filtration.

The work has been carried out at a cost of £30,000, and on the 19th inst. filtration stations at Greenfield, Saddleworth and Swineshaw—amongst the largest of their type in the kingdom—were officially opened. The two installations comprise thirty-six pressure filters, designed to purify collectively 5,352,000 gallons of water per day. The filters and the chemical plant have been supplied and erected by Messrs. Mather & Platt, Ltd., of Manchester. Practically the whole of the power in the filter houses is generated by water. The works were designed and supervised by the engineer for the Joint Committee, Mr. Fred J. Dixon, F.G.S., A.M.Inst.C.E. Mr. C. H. George, A.M.Inst.C.E., has acted as assistant-engineer.

ANSWERS TO CORRESPONDENTS.

SPECULATOR.—1. Although you do not state so, it is presumed the mortgage was in favour of the lessor, C., who, according to the arrangement subsequently made, has a right to sue R. for the value of the extra work done on the houses at the latter's request. 2. The mortgagee, C., can recover from the builder, W., in the County Court any exorbitant and unreasonable overcharge paid for the cost of materials. If the defendant goes into the witness box he may be cross-examined as to the two previous blunders he made regarding overtime and materials. It is not wise to take legal proceedings without the aid of a solicitor, who will agree beforehand as to the amount of his costs if asked to.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.**BUCKINGHAMSHIRE.***Buckingham.*—Council cottages.*Terriers.*—Church Hall.*Wycombe.*—Wesleyan Church, Victoria Road: additions.

Factory, West End Road: additions for Messrs. B. Goodearl & Sons.

Chair factory: additions for Mr. E. Gomme.

Chair factory, Abercromby Avenue: additions for Messrs. Joynson, Holland & Co.

Two houses, Desborough Park Road, for Mr. F. Nash.

Two houses, Lucas Road, for Mr. H. T. Dickens.

Laundry, Totteridge Road: additions for the High

Wycombe Steam Laundry Co., Ltd.

Store, Baker Street, for Mr. G. Cooper.

CHESHIRE.*Birkenhead.*—Technical instruction wing to the Lancashire (Navy League) and National Sea Training Home for poor boys, Liscard (£2,500).**CORNWALL.***Burraton and St. Mellions (near).*—Five workmen's cottages. Mr. H. A. Hosking (of Landrake), architect.**CUMBERLAND.***Carlisle.*—Elementary School for 400 places, Newtown (£6,500).*Etterby.*—Sixteen houses, Kingmoor Road. Mr. E. J. Hill (of Carlisle), builder.*Upperby.*—Five cottages for Mr. Briscoe (of Wreay). Mr. E. Musgrave (of Carlisle), builder.**DERBYSHIRE.***Dore and Totley.*—Union Church, Totley Brook Road.**HAMPSHIRE.***Portsmouth.*—The Convent of the Helpers of Holy Souls, Commercial Road, Landport.**HEREFORDSHIRE.***Ledbury.*—Infants' Council School.**ISLE OF WIGHT.***St. Helen's.*—Park House, St. John's Park: additions for Mr. C. Langdon.**KENT.***Dover.*—King's Hall, Queen's Gardens: additions for Mr. A. H. Steele.*Eastry.*—House, Knowlton, for Mr. F. E. Speed. Mr. G. Browning, builder.*Kennington.*—Two houses, Faversham Road, for Mr. W. J. Baker.*Willesborough.*—Three houses, Canterbury Road, for Mr. E. Garnett.

Works extension for Messrs. Earl & Bailey.

Worth.—Bungalow addition for Mrs. Kemp.*Wye.*—Motor garage, Bridge Street, for Mr. C. E. Taylor.**LANCASHIRE.***Heaton Park.*—Old Town Hall: re-erection of façade. City architect.*Liverpool.*—Picture palace, 210 Walton Road, for Mr. E. Roberts.

Picture palace, West Derby Road (near Empire Street), for Mr. J. Ellis.

Picture palace, Warbreck Moor and Barnston Road corner, Aintree, for Mr. T. Spencer.

Picture palace, 21-31 Marsh Street, Kirkdale, for Mr. W. Hutchinson.

Picture palace, West Derby Road and Lisburn Lane, Tue Brook, for Mr. J. Johnston.

MIDDLESEX.*Ealing.*—Wesleyan School chapel, Pitshanger (£1,600).*Hornsey.*—Salvation Army citadel, Tottenham Lane (£2,400).**MONMOUTHSHIRE.***Talywain.*—The "Commercial" Inn: alterations: Mr. T. Roderick (of Aberdare), architect.**NORTHAMPTONSHIRE.***Desborough.*—Church Day schools: improvements (£1,700).*Long Buckby.*—Co-op. Soc. houses, Holyoake Terrace.**NORTHUMBERLAND.***Newcastle-upon-Tyne.*—Mortuary, &c., Old Toll House, Swing Bridge. City surveyor; also

Post-mortem Room, under High Level Bridge.

Picture hall for 1,100 sittings, Chillingham Road and Tosson Terrace. Mr. P. L. Brown, architect.

NOTTINGHAMSHIRE.*Mansfield.*—Twenty-five houses for the Garden City Estate Co.*Nottingham.*—Baptist Church, Mansfield Road: Mechanics' Institute extension.*Retford.*—St. Alban's Church extension. (Accommodation for additional 250 sittings.) £2,000.*Sutton-in-Ashfield.*—Council School for 350 places.**SHROPSHIRE.***Oswestry.*—Workhouse: additional tramp-wards.**SOMERSET.***Taunton.*—Theatre and baths, &c., North Street. (Theatre accommodation for 1,500 sittings.) Messrs. Stone & Lloyd, architects.**SURREY.***Cobham.*—Parish Room.*Croydon.*—St. Stephen's Church.*Guildford.*—Girls' County School.*Leatherhead.*—Infants' school, Gravel Hill: conversion into picture palace.**SUSSEX.***Bexhill.*—Business premises, 57 Devonshire Road: additions. Mr. J. B. Wall, F.R.I.B.A., architect; also

House, Collington Lane.

Bungalow, Dalmeny Rd. Mr. H. Farnfield, architect.

House, Collington Avenue. Mr. B. Stevens, architect; also

Four semi-detached houses, Cranston Avenue.

"Granard," Rotherfield Avenue: additions. Messrs. Hicks & Co., architects.

"Trawalla," Rotherfield Avenue: additions. Messrs. Stevens & Son, architects.

House, Collington Avenue. Mr. P. D. Stonham, architect; also

House, Sutherland Avenue; also

House, Colebrook Road; also

House, Little Common Road; also

House, Warwick Road.

No. 4 St. Stephen's Villas: addition. Mr. J. H. Lye, architect.

Brighton.—Drill Hall and Headquarters, Sussex Place, for the Imperial Service Cadet Corps.

Sanatorium, Hove: additional ward block.

Chichester.—Cottage Homes, Stockbridge, for the City Guardians.*Hayward's Heath.*—Roman Catholic school.*Horsham.*—St. John's School, Springfield Road: additions and alterations.**WORCESTERSHIRE.***Broadway.*—Sixty cottages (£10,000).*Bromsgrove.*—Guardians' buildings for consumptive cases. Mr. A. Vernon Rowe, architect.*Tardebigge.*—Schools: additions for the Earl of Plymouth.**YORKSHIRE.***Cold Coniston.*—Council School alterations. Education architect, County Hall, Wakefield.*Harrogate.*—St. Mary's Church.*Hawes.*—Wesleyan Chapel (£2,000).*Thirsk.*—Workhouse alterations. Mr. J. Cooke (of Harrogate), architect.*Ulleskelf.*—Wesleyan Chapel (£1,500).**WALES.***Corris.*—Public Institute.*Denbigh.*—Bacon factory.

House: alterations for Mr. Dryhurst Roberts.

Llandrindod Wells.—Elementary school and headmaster's residence (£6,000).*Rhyl.*—Drill Hall and Instructor's residence, &c. (£4,000).*Treorchy.*—Four houses and a shop, Park Road, Cwmparc.

Mr. W. D. Morgan (of Pentre), architect.

SCOTLAND.*Beaully.*—Golf Clubhouse.*Dumfries.*—County buildings (£17,000). Mr. J. M. D. Peddie (of Edinburgh), architect.*Dundee.*—Cottage, American Muir Road, for Mr. R. Donn.

Semi-detached cottages, East Haddon Road, for Mr. T. C. Stocks.

Royal Infirmary: Lodge, &c., Barrack Road.

Semi-detached villas, Dalkeith Road, for Messrs. J. Foggie & Son.

Dunfermline.—Carnegie Trust Baths and Gymnasium: extensions.

Opera House: re-construction.

Works, Castleblair: partial rebuilding for Messrs. Inglis & Co.

Workshops, Castleblair Park, for Mr. J. Rintoul.

SCOTLAND—continued.

Glasgow.—Hall, No. 298 New City Road, for Miss E. Taylor (of Possilpark).

No. 44 Washington Street: additions and alterations, for Messrs. W. P. Lowrie & Co., Ltd.

Works, Parkhead. Messrs. W. Beardmore & Co., Ltd. Hospital at Stobhill: additions and alterations to offices, &c.

Fourteen villas, Overtoun Road, Upper Dalmaur. Mr. L. Kirk (of Clydebank), builder.

Lochee.—Wash-houses, Logie Street, for Guild's Trustees.

Paisley.—Works re-building, Seedhill, for Messrs. W. J. & W. Lang.

Portobello.—Town Hall (£7,000).

IRELAND.

Dublin.—Forty-four cottages, Carysfort Road.

Richmond.—Five cottages for the Asylum Committee.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 26,131. Nov. 22, 1911.—Improvements in or relating to domestic fireplaces. L. H. Teale, 1 Heathfield Terrace, Far Headingley, Leeds. This invention relates to domestic fireplaces of the type in which the ashes are removed and the bottom air supply regulated by way of a pit hollowed out of the rear of the hearth in front of the firegrate, the pit being fitted with a metal front shield or liner and being closed by a plate or lid. Fig. 1 is a sectional side elevation of a raised

hearth fireplace having the improvements applied. Fig. 2 is a plan partly in section and on a smaller scale. The rear of the raised hearth, A, is hollowed out in front of the firegrate to form a space or pit, C, in front of the ash chamber, D, to facilitate raking out the ashes, and is fitted with a corresponding shaped upright metal hearth shield, B, which

has an outer lip to protect the inner edge of the hearth tiling. The cleaning out pit, C, is covered by a loose trivet, E, which is fitted in front (or at front and sides) with small feet, F, resting upon the hearth tiles, the loose trivet, E, having also a curved upright back plate, G, which fits within the cleaning out pit, C, thus forming a further support for the back of the trivet, and at the same time serving as an economiser to restrict the admission of air beneath the fire and ensure slow combustion. The fireplace is fitted with a raised detachable grate, H. August 21, 1912.

PATENT SPECIFICATIONS PUBLISHED
SEPTEMBER 19, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 6,359. March 14, 1912.—Date claimed under International Convention Feb. 1, 1912. Firm C. F. Schroeder, Volmarstein, Westphalia, Germany. Locks.

7,446. March 27, 1912.—Otto Heidrich, Deutsch-Neukirch, Upper Silesia, Germany. Hollow bricks.

8,016. April 3, 1912.—Date claimed under International Convention April 29, 1911. Soc. Anon. des Manufactures des Glaces et Produits Chimiques de Saint-Gobain, Chauny and Cirey, of Ibis Place des Saussaies, Paris. Ornamentation of rolled plate glass.

9,484. April 22, 1912.—Frederic de Mare, 122 Boulevard Leopold II, Brussels. Ozone generating and air filtering fan.

14,740. June 21, 1911.—E. R. Calthrop, Eldon Street House, Eldon Street, London; L. E. Hill, Osborne House, Loughton; and H. W. Child, 112 Durants Road, Ponder's End, Middlesex. Production of sash bars and the like for glazing roofs, windows, and structures in general.

17,215. July 27, 1911.—F. C. York, 27 Waterloo Place, Leamington. Water purification plants.

18,951. Aug. 23, 1911.—A. G. Grice and Geo. Anderson & Co. (1905), Ltd., Carnoustie, Scotland. Apparatus for stone and marble cutting.

19,102. Aug. 25, 1911.—Geo. Chisholm, Providence Works, Fleet Street, Birmingham. Flanged metal pipes particularly applicable for effecting joints with water closet cisterns.

19,792. Sept. 5, 1911.—J. W. Duntley, Harvester Building, Chicago, U.S. Air washing and disinfecting apparatus.

19,916. Sept. 7, 1911.—H. A. Allen, "Ottawa," Setton Road, Northampton Road, Croydon. Stoves and fireplaces.

21,292. Sept. 27, 1911.—F. H. Sharpe, F.C.S., The Ferns, Cressington Park, near Liverpool. Method of and in apparatus for the manufacture of white lead.

22,977. Oct. 18, 1911.—A. J. Bell and P. A. G. Bell, Calder Ironworks, Ravensthorpe, York. Motors for use in adding chemicals to water, sewage, or other liquids for the purpose of purifying or softening same.

23,449. Oct. 24, 1911.—M. T. Medway, 175 Shardeloes Road, Deptford, S.E. Positive safety device or apparatus for lift and hoist openings.

23,917. Oct. 28, 1911.—William Knott, F. C. Giles, and A. Giles, all of 117 Scholefield Street, Birmingham. Casement fastenings.

24,070. Oct. 31, 1911.—Samuel Stott, 7 Dorset Street, Werneth, and J. T. Booth, 45 Gainsborough Avenue, Coppice, Oldham. Planks employed by painters and decorators.

24,831. Nov. 8, 1911.—Thomas Baird, junr., F.R.I.B.A., 134 Bath Street, Glasgow. Construction of floors for buildings.

25,082. Nov. 10, 1911.—F. W. Beard, 32 Winchester Avenue, Brondesbury, N.W. Refrigerating chambers.

25,230. Nov. 13, 1911.—C. J. Ford, 53 Copenhagen Road, Gillingham, Kent. Attachment for paint kettles.

25,251. Nov. 13, 1911.—Enrique Disdier, 95 Muelle, Malaga, Spain. Drying apparatus more particularly intended for the drying of sticky or pitchy substances.

26,403. Oct. 10, 1911.—Date claimed under International Convention Nov. 25, 1910. Dr. August Kahr, Kattowitz, Upper Schleswig, Germany. Machines for manufacturing hollow bricks closed on all sides.

29,166. Dec. 28, 1911.—Alldays & Onions Pneumatic Engineering Co., Ltd., and Oswald Scott, of Great Western Works, Sydenham Road, Birmingham. Radiators for heating buildings and the like.

2,046. Jan. 25, 1912.—Date claimed under International Convention Sept. 2, 1911. Otto Schultz, 70 Kurfürstendamm, Berlin. Construction of gratings, chain work, girders or other load-supporting means formed of metal strip welded together.

545. Jan. 8, 1912.—Harry Evershed, Salford Priors, Warwickshire. Appliances for removing, excavating, or transporting soil, mud, and the like.

7270. March 25, 1912.—Emil Barthelmess, 2 Breitestr., Neuss a/Rhein. Grinding or reducing apparatus.

8,415. April 9, 1912.—Victor Winkler, 133 Boulevard Magenta, Paris. Ruling and drawing devices.

9,757. April 24, 1912.—Johannes Baudenbacher, Sachsische, Privatblaufarbenwerke, Verein Niederpfannestiel, near Aue in Erzgebirge, Germany. Protective plating for safes, strongrooms, &c.

10,009. April 27, 1912.—Veritys, Ltd., King Street, Covent Garden, London, and W. G. Pipkin, 65 Francis Road, Erdington, Warwick. Electrically heated ovens.

12,151. May 22, 1912.—Frederick Hodgson, 24 Queen Victoria Street, E.C. Cabinets for dinner or service lifts.

12,487. May 25, 1912.—E. von Woisky, Basien, near Wormditt, Eastern Prussia. Self-feeding paint brushes.

14,942. June 26, 1912.—Date claimed under International Convention June 26, 1911. H. C. Seipp, Bessemer Building, Pittsburg, U.S. Safety tread.

15,921. July 8, 1912.—Maurice Freud, Alte-Jacobstr. 20, Berlin 68. Mounting or framing for sliding glass doors.

WATER SOFTENING.*

As far back as 1756 the natural zeolites are first described in the "Transactions" of the Academy of Sciences at Stockholm; but it was not until 1850 that Theodor Way, consulting chemist to the Royal Agricultural Society in London, established the fact that the zeolites placed in contact with salt solutions were capable of absorbing the bases contained in the dissolved salts, at the same time yielding up into solution the bases which they themselves contained.

Let me here repeat one of Way's experiments.

In this small glass filter you see a layer of natural zeolites; for convenience I took fuller's earth. I will pass through it a water of 10° hardness, and as you will see from the test I now make the hardness of the filtered water has been reduced.

The following reaction took place:—The bases contained in the hard water, calcium and magnesium, have been absorbed by the zeolites, and the latter have given up their own bases (sodium) to the water.

This experiment explains to a certain degree why a soft water of perhaps 7° is very often found at a depth of, say, 500 feet, while at a depth of 100 feet the hardness of the water out of the same borehole is 50°.

The explanation is that rain water passing through a strata of limestone, and thus becoming hard, afterwards passes through a layer of these natural zeolites, whose softening action you saw just now.

Dr. Gans, Professor at the Mining Academy of Berlin, and President of the Laboratory of Geonomy at the Berlin University, made a thoroughly scientific research of the natural zeolites, classified them, and published the constitution formulæ. I shall not bother you here with all the chemical formulæ; but anybody who cares to have them, I refer to the March number of the "Journal" of the Society of Dyers and Colourists.

Ultimately Professor Gans succeeded in producing zeolites artificially, and took out a patent to manufacture artificial zeolites on a commercial scale in the year 1906.

He named his artificial zeolites "Permutit" from the Latin "permutare," to exchange.

The great outstanding property of permutit, against the natural zeolites, is its greater power of exchanging its own base against other bases. This process of exchange follows closely the stoichiometric law of chemistry, and you can readily convert sodium-permutit into calcium-permutit, magnesium-permutit, ammonium-permutit, potassium-permutit, &c., by passing through it solutions of calcium, magnesium, ammonia, potassium.

The proof that only an exchange of bases takes place is shown by the fact that if you pass through a layer of calcium-permutit, magnesium-permutit, &c., a salt solution which contains the base sodium, you convert the calcium and magnesium-permutit back into sodium-permutit.

The following experiments will illustrate my previous remarks:—

I have here in this glass tube a layer of sodium-permutit,

which, as you see, is a grey, porous silicate, and will pass a hard water of 20° through the permutit. (The hardness consists of 10° bicarbonate of calcium and 10° sulphate of calcium.) You see the exchange takes place. The sodium-permutit has absorbed the calcium from the hard water and yielded its own sodium basis to the water. The filtered water is 0°.

To illustrate this further, I will pass a water of 20° through the same filter; the hardness in this case is due to magnesium sulphate.

You see, again, the filtered water is 0°, showing that the exchange of the base magnesium took place as readily as when calcium was removed.

The next filter contains a layer of calcium-permutit. Now, if I pass a solution of common salt (the basis of which is sodium) through the filter, the base calcium from the calcium-permutit enters the common salt solution and the sodium enters the permutit. As you will see, the solution leaving the filter contains the calcium which has been turned out of the permutit, as I will show you by adding ammonium-oxalate, which, in the presence of calcium, will form a white precipitate.

Gentlemen, these experiments disclose the whole Permutit process for water softening down to 0°, and the procedure of regeneration.

Let me repeat in words what we saw, and so describe this new process.

If a water of a given hardness is passed through a bed of sodium-permutit, the sodium in the permutit is replaced by the calcium and magnesium taken from the water giving a calcium-magnesium-permutit, while the acid radicles formerly united to the calcium and magnesium in the water unite with the sodium which is turned out of the permutit. There will obviously come a time when all the sodium in the sodium-permutit has been replaced by calcium and magnesium from the treated water. When this period is reached it is not necessary to renew the permutit which has become exhausted, but to regenerate or revivify it. This is done by the action of a solution of common salt on the exhausted permutit. The laws of chemical exchange again come into play, the interchange being in this case in the opposite direction, sodium from salt driving out the calcium and magnesium from the exhausted permutit and converting it back to sodium-permutit.

It is obvious that all the manufacturer of sodium-permutit plants has to do is to calculate how much sodium-permutit is necessary to take out the hardness of the water per hour and per day, and then to place the permutit into a cylinder.

Many methods have been, and still are, employed to soften a water—one precipitates the lime and the magnesia in the water by addition of lime and soda, the other by addition of lime and baryta, the third by addition of caustic soda.

But all these processes suffer from the disadvantage that in the softening of cold water the precipitation of the lime and magnesia does not take place instantaneously, but only after a comparatively long time. It is also impossible to obtain a complete softening down to zero degrees by any one of the said processes.

Gentlemen, if you take into account the fact that most of the water supplies in England are of a variable nature, the constituents changing daily, in some cases hourly, then you will agree with me that by the aid of a fully trained water chemist only is it possible to use any of the above-mentioned processes for softening water down to 4° without making it more injurious than the crude water, on the one hand, through an excess of the reagents used, and, on the other hand, by an insufficient quantity of chemicals, resulting in a partially treated and invariably turbid and cloudy water.

I have nothing to say against the above-mentioned three processes when they are worked by a trained water chemist, who makes the analysis of the water every hour and adjusts the amount of reagents according to his analysis, testing at the same time the composition of his reagents and controlling the softened water. If this trained water chemist is to succeed in softening the water down to 4-5°, and keep its alkalinity down, then his time is fully occupied the whole day long.

What I absolutely deny is the possibility of an automatically working lime and soda water-softening plant. This plant is built of invariably stock sizes for all waters, irrespective of their composition, although an analysis is generally made in the laboratory of the seller of the plants. The manufacturer is told to add so much lime and so much soda to the water, the settling time being generally calculated as sufficient with one hour, which is totally inadequate.

* A Paper entitled "Notes on Water Softening," by Dr. John F. Meyer, read at a South-Eastern District Meeting of the Institution of Municipal Engineers.

The manufacturer is very often left alone with it, and finds perhaps after six months that the scale in his boilers is not quite as thick as before, but hard like enamel. The economisers are choked up with a very fine powder; in the washing machines he finds a layer of a fine powder, the pipes are filled with this fine powder, the dyed goods are inferior to when using hard water, the wool washed with the softened water has become harsh, &c.

The manufacturer requires these defects to be put right, and, owing to this being impossible, comes to the conclusion that water softening is a thing not sufficiently advanced to be of any value. The manufacturer finds this automatically working apparatus cannot produce automatically a soft water, because the crude water changes every day, making it necessary to add different quantities of reagents, because the reagents have changed their composition, all of which he learns by experience; in the meantime, he has bought new machinery to put the first plant right, in order to do the impossible.

This goes on as long as the patience of the manufacturer lasts. In many cases the automatically worked water-softening plant ends in the works as a storage tank.

Gentlemen, every chemist can tell you that the composition of the permutitised water is such that these dangerous troubles which I have mentioned just now cannot possibly occur. It is chemically impossible, because there is no lime and magnesia left in the permutitised water, and this is the reason why the Permutit process for water softening claims superiority.

Please understand, however much the water may vary in hardness, it is always reduced to 0°, and, therefore, no incrustation can take place in economiser tubes or boilers, as always occurs in waters partly softened by other processes.

The permutitised water effects the largest possible saving in those industries or places where soap is used, and it is, along with distilled water, the only water which prevents the formation of sticky, insoluble lime, and magnesia soaps and the objectionable lime lakes in dyeing and finishing.

Permutitised water is, further, an excellent water for drinking purposes, confirmed by the most eminent medical doctors of to-day. Let me please explain why I say that a water-softening plant of the lime and soda system should not be installed without giving the buyer the chemical explanation why his plant cannot fulfil the claims made for it except under certain conditions, and why it happens that sometimes it cannot fulfil them at all.

There is no other country in Europe with such an enormous and flourishing industry as England. The consequence of which is that the available water becomes worse and worse, compelling the manufacturer to treat it artificially to make it suitable for his purposes. He knows full well that the question of water is a most serious one, upon which his entire business depends, and should be made aware of the whole of the difficulties and troubles liable to arise with any system of softening under all conditions and at all times.

If some of you had been with me during the last nine months through factories and mills in this country, you would have received ample proof of my statement that I did not in one single case come across a lime-soda plant automatically worked which was working satisfactorily, or giving for the manufacturer constant results. It is not always the fault of the seller of lime-soda plants, but he should acquaint the purchaser what to expect. He is not the only sufferer. Water softening gets an undeserved bad name, and I am sure there would not be half the failures there are with lime-soda plants were all points laid clear from the beginning as to what the actual, not theoretical, results would be.

A further phase of the Permutit process is the manganese-permutit, manufactured by precipitating heptoxide of manganese on a permutit by permanganate of potassium.

If I pass a water which contains iron or manganese through this filter all the iron and manganese salts will be oxidised and kept back in the permutit. The regeneration of the filter takes place by using a solution of permanganate of potassium. These manganese-permutit filters work excellently in those cases where every trace of iron and manganese has to be taken out of the water, and further to eliminate organic matter.

Another application of the manganese-permutit filters is to sterilise waters which contain harmful germs.

Since these plants can be worked at a high rate of filtration, the initial and working costs are very small, the working costs being about $\frac{1}{2}$ d. per 1,000 gallons of water treated.

It would be beyond the scope of this paper to deal with all the uses that permutit can be put to. Among many uses are:—

Manufacturing of salts of a certain base by double exchange.

The eliminating of dangerous alkaline salts from the diffusion juice in the sugar industry.

The obtaining of gold from very dilute solutions; and in different combinations permutit practically possesses an unlimited field.

VARIETIES.

THE will of Mr. Benjamin Morton, aged seventy-three, of Bakewell, Derbyshire, and of Manchester, builder and contractor, has been proved at £78,180 gross.

THE Pembroke (Co. Dublin) Urban District Council on Monday approved a scheme for providing 295 houses in the Delta district of Ringsend at a cost of £60,000.

THE Bristol Board of Guardians have approved the execution of works in connection with the substitution of electric lighting for gas lighting at the Stapleton Workhouse, at a cost not exceeding £1,016.

MESSRS. S. PEARSON & SONS, LTD., have received the first contract in the great scheme of dock extension and improvements projected by the Port of London Authority. The work to be proceeded with will cost about £2,350,000.

THE contract for the erection of a post office at Wick, N.B., has been obtained by Mr. A. Hall, Mile End Joinery Works, Aberdeen. The contract price is about £7,000. The buildings are to be ready within about a year. The new office is to be in Market Place.

THE Southampton Education Committee are about to apply for a loan of £18,400, being the estimated cost of a school accommodating 1,260 scholars in King Edward Avenue. The plans have been prepared by Mr. J. A. Crowther, the borough engineer.

A LOCAL Government Board inquiry was held last week at Stafford into an application for their approval of the appropriation by the Town Council of land in Backwalls South as a site for twenty working-class houses, and for sanction to borrow £3,200 for the erection of the dwellings.

THE Selby Urban District Council, meeting in committee on Monday, decided to offer to purchase land in Armoury Lane for the building of about 50 artisans' houses. The purchase of another plot in the Flaxley Road district for 57 dwellings, at a cost of £500, is under consideration.

THE Croydon Town Council on Monday agreed to apply to the Local Government Board for sanction to a loan of about £20,000, being Croydon's contribution to a proposed new road $3\frac{1}{2}$ miles long from Thornton Heath to Purley, which will relieve the congested main road. The total estimated cost is £55,000, and of this amount £30,000 will be given by the Road Board.

THE Council of the Historic Society of Lancashire and Cheshire have passed a resolution that, while supporting the erection of a memorial to his late Majesty King Edward VII. on a suitable site, they strongly protested against any scheme which involved the alteration of the southern base of St. George's Hall.

MESSRS. BALDWIN, LTD., iron, steel, and tinplate manufacturers, are projecting a scheme for their steelworks at Port Talbot. They propose to spend £300,000 on extensions, which will take the form of three new modern smelting furnaces of the Siemens pattern, another new plate mill and a section mill will also be constructed, and these, when completed, will provide additional employment for 200 or 300 men.

THE usual lectures on the history and architecture of St. Bartholomew the Great, West Smithfield, E.C., will be given on Saturdays, October 12 and 19, at 2.30 P.M. The stone coffin and the worked stones recently found on the site of the chapter-house will be on view in the cloister. No fees are charged, but a collection will be made for the Restoration Fund of the church, now greatly in need of support.

AT the present time the Berkefeld Filter Co., whose offices and showrooms are at 121 Oxford Street, London, W., are executing an order for the Egyptian State Railways for 750 "Berkefeld" germproof filters and spare cylinders. We have from time to time made reference in these columns to the value of the Berkefeld filter. In this country, fortunately, our water supplies are, generally speaking, fairly pure, and, in consequence, it requires an outbreak of typhoid or diphtheria before we consider the question of taking the precaution of ensuring that the water we drink is of absolute purity. This is not as it should be; "cure" is an excellent word, but "prevention" is a better one. The Berkefeld filter is so easily fitted, so reasonable, and so simple to keep clean that no house should be without one.

WEEK-END COTTAGES, BUNGALOWS, AND OTHER SMALL HOUSES.

We again have the pleasure of presenting a number of designs of varied character, both as regards treatment and cost, by different architects, whom the Editor will be pleased to introduce to anyone who would wish to build a house according to the sketches or a modification of them.

DESIGN NO. 55.

GARDEN FRONT.

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

SECOND FLOOR PLAN.

This house has an exceedingly compact and simple plan and contains two sitting-rooms and eight bedrooms, or three sitting-rooms and seven bedrooms, with excellent and well arranged kitchen and offices. Plenty of cupboards are provided and a pleasant loggia on the garden front, as shown in the view. Brick faced walls on the ground storey with hung tiling and half-timber work above are intended, with tile covered roofs. The cost of this house would be about £1,100.

DESIGN NO. 56.

ENTRANCE FRONT.

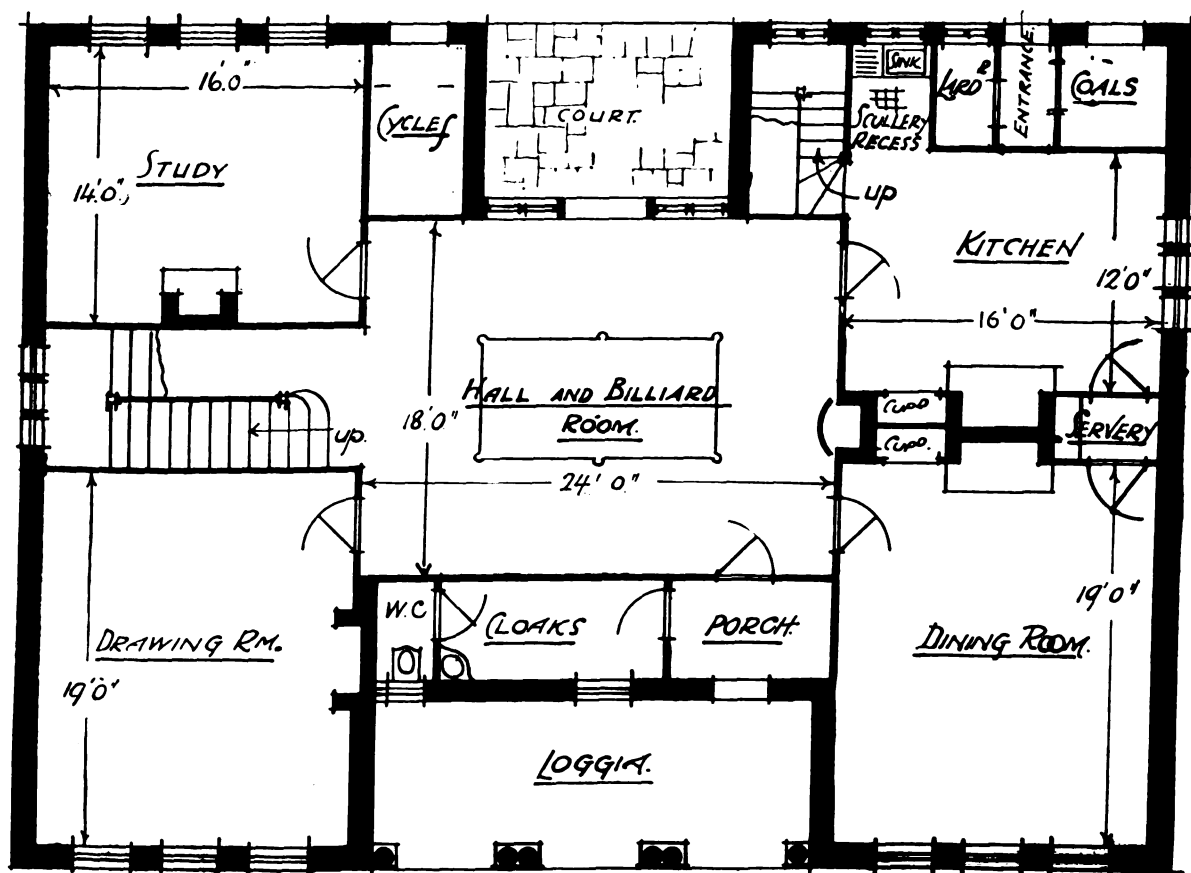

The dominant feature in the planning of this house is the provision of a hall twenty-four feet by eighteen feet, which is large enough to admit of a full-sized billiard table being used with comfort. Besides this hall there are a large dining-room, drawing-room and study, so that the house possesses four excellent reception rooms. As shown on the first-floor plan seven good bedrooms are provided, and a back staircase allows servants to reach the bedroom floor from the kitchen without passing through the hall. It is intended that this house should be built with red and purple bricks, with part of the upper storey rough-cast and grey Delabole slate for the roofs.

The cost of the house in these materials would be about £1,700.

DESIGN NO. 56—continued.

FIRST FLOOR PLAN.

GROUND FLOOR PLAN.

DESIGN NO. 57.

This house is intended for a suburban or country residence for a family of about six people, and comprises drawing-room, dining-room, and sitting-hall on the ground floor with the usual offices, whilst five bedrooms are provided on two upper floors, together with small room intended for a study. The walls would be built in narrow red bricks, with stone dressings to openings and angles, and the windows would be glazed with leaded glass in metal casements. The roof would be covered with green rustic slates. It is estimated that the cost would work out at about £1,200.

DESIGN NO. 57—continued.

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

SECOND FLOOR PLAN.

"LOCO"-GAS.

FOR ECONOMY AND BETTER LIGHT MAKE YOUR OWN GAS.

GLENVEAGH CASTLE.

"Loco" Air-Gas Installed May, 1909.

120 Lights.

UNSOLICITED TESTIMONIAL FROM THE OWNER.

"I must tell you how delighted I am with the installation of "LOCO" AIR-GAS at Glenveagh Castle. It is such a success. The light is so brilliant and soft; all my guests were also full of praises, and the cost is so wonderfully small compared with other lights. It is exactly suited to large country houses."

This simple little machine does all this lighting in a most satisfactory and economical manner (see testimonial), and is still running, and likely to continue for over twenty years. Select a machine not made of tin with soldered joints, or of galvanised iron, which materials are known soon to perish, but of substantial cast iron, solid drawn steel piping, and gunmetal, screwed together in a safe, permanent, and mechanical manner.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

• As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

LONDON.—Oct. 14.—The Wandsworth Borough Council invite competitive designs for a public swimming bath at Balham. A copy of the conditions of competition, schedule of accommodation to be provided, and plan of the site may on payment of £1 1s. deposit be obtained from Mr. P. Dodd, M.I.C.E., borough engineer, 215 Balham High Road, S.W.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ALNE.—Oct. 11.—For the erection of a schoolroom, vestry, and Wesleyan church, Alne, Yorks. Mr. J. F. Todd, architect and surveyor, Easingwold.

ASHTON-UNDER-LYNE.—Oct. 17.—For the erection of an elementary school to accommodate 400 children at Waterloo. Deposit £2. Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

BIRMINGHAM.—Oct. 10.—For erection of boundary walls on the site of the proposed Birmingham telegraph factory, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. J. Tosh, H.M. Office of Works, Pinfold Street, Birmingham, and H.M. Office of Works, &c., Storey's Gate, S.W.

BISHOP AUCKLAND.—Oct. 5.—The Auckland, Shildon, and Willington Joint Hospital Board invite sole tenders for erection of additional blocks at their No. 1 and No. 2 hospitals, situate respectively at Tindale Crescent and Helmington Row; and also a separate sole tender for erection of a caretaker's house at the No. 1 hospital. Send applications and £1 1s. deposit by Oct. 5. Mr. R. B. Thompson, architect, Bishop Auckland.

BLACKBURN.—Oct. 14.—For new tower and completion of St. Silas Church. Messrs. Austin & Paley, architects, Lancaster.

BOWDERDALE.—Oct. 10.—For alterations to the farmhouse, Bowderdale, Wasdale, Cumberland. Deposit £2 2s. Mr. J. H. Rea, Gatehouse, Eskdale, Cumberland.

BRISTOL.—Oct. 16.—For the formation of muniment rooms under the rates office at the Council House. Mr. P. Addie, city valuer, The Exchange, Bristol.

BURRATON AND ST. MELLION.—Oct. 9.—For the erection of five workmen's cottages near Burraton and St. Mellion, Cornwall (two separate tenders), for the St. Germans Rural District Council. Deposit £2 2s. Mr. H. A. Hosking, architect, Landrake.

CHELMSFORD.—Oct. 16.—For the pulling down and removal of part of the "Old White Hart" premises, at the corner of Moulsham Street and Baddow Road, the materials to be the property of the contractor. The Borough Engineer, Municipal Offices, 16 London Road, Chelmsford.

CHELTENHAM.—Oct. 10.—For repairs and renovations to Marlborough House, Winchcombe Street, for the Education Committee. Messrs. Chatters & Smithson, architects, 17 Regent Street, Cheltenham.

CHORLEY.—Oct. 14.—For renovating the Independent Methodist Church. Mr. A. Bennett, secretary, 99 Eaves Lane, Chorley.

GOLCAR.—Oct. 7.—For the various trades required in erection of one dwelling-house in East Street. Mr. A. Shaw, architect, Golcar.

HALIFAX.—For erection of extension to Kingston Toffee Mills, for Messrs. Riley Bros. Messrs. Glendinning & Hanson, architects, 15 Commercial Street, Halifax.

HARROW.—Oct. 12.—For the construction of two public conveniences, for the Urban District Council. The Surveyor to the Council, Council Offices, Harrow.

HENDON.—Oct. 21.—For erection of fifty artisans' dwellings at Child's Hill, for the Hendon Urban District Council. Deposit £3 3s. Mr. G. Hornblower, F.R.I.B.A., 2 Devonshire Terrace, Portland Place, London, W.

HENDON.—Oct. 21.—For erection of central fire station at The Burroughs, for the Hendon Urban District Council. Deposit £3 3s. Mr. H. A. Welch, 20 Golder's Green Parade, Golder's Green, Hendon.

HEPTONSTALL.—Oct. 18.—The West Riding Education Committee invite whole tenders for the following work at Heptonstall Council School—viz.: Playground. The Education Architect, County Hall, Wakefield.

HERNE BAY.—Oct. 16.—For erection of a pavilion and concert hall on the East Cliff, for the Urban District Council. The Surveyor, Town Hall, Herne Bay.

HUDDERSFIELD.—Oct. 10.—For the trades required in erection of a receiving home for children at the back of 32 Ramsden Street, and fronting Back Ramsden Street, for the Guardians. Messrs. Kirk & Sons, architects, Market Place, Huddersfield.

HUDDERSFIELD.—Oct. 21.—For the masons', joiners', plumbers', slaters', plasterers', painters', concretors', electricians', heating engineers', and iron and steel founders' works required in erection of two-storey warehouse and offices, St. Andrew's Road. Messrs. Abbey & Hanson, 11 Cloth Hall Street, Huddersfield.

IRELAND.—Oct. 9.—For the erection of the following cottages, for the Rathdown Rural District Council: (1) Two double cottages at Lower Rathdown; (2) two double cottages at Stilebawn; (3) one single cottage at Stilebawn; (4) one single cottage at Monastery. Mr. Patrick Cuniam, clerk, Loughlinstown.

IRELAND.—Oct. 10.—For erection and furnishing of National school buildings at Drumclugh, Bantry, co. Cork. Bantry Royal Irish Constabulary Barrack.

IRELAND.—Oct. 14.—For erection of an electric and general millwright shop at Dundalk, for the Great Northern Railway Co. (Ireland). Deposit £1 1s. The Engineer's Offices at Dublin and Belfast, and Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Oct. 14.—For erection of five houses adjacent to Tate's Avenue, Belfast, for the Great Northern Railway Co. (Ireland). Deposit £2 2s. The Engineer's offices at Dublin and Belfast. Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Oct. 14.—For erection of stables, cart sheds, and dwelling-houses, Beechfield Street, Belfast, for Messrs. Ferris & Co., cartage contractors. Mr. C. MacAlister, architect, Whitehall Buildings, Belfast.

IRELAND.—Oct. 15.—For erection of the following dwellings: (1) Forty-four three-room houses, in three blocks; (2) twenty two-room houses, in two blocks; (3) one four-room house, together with construction of roads, paths, water mains, sewers, &c., at Bray. (Mr. P. H. McCarthy, B.E., architect, 39 Westmorland Street, Dublin.) Send £2 2s. deposit to Mr. P. MacDonnell, clerk, Town Hall, Bray.

KEIGHLEY.—Oct. 10.—For the various works (except joiners' and painters' work) required in erection of bakery in Greengate Road. Messrs. J. Haggas & Sons, architects, &c., North Street, Keighley.

LEICESTER.—Oct. 14.—For alterations and additions to the Leicester Inland Revenue Offices, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. The Collector of Customs and Excise, Newark Street, Leicester, and H.M. Office of Works, &c., Storey's Gate, S.W.

LITTLE LANGDALE.—Oct. 19.—For the necessary work of erecting a stone arch bridge and making approaches at Fitz Ford, for the South Westmorland and Ulverston Rural District Councils. Mr. J. W. Nelson, surveyor, 5 Lowther Street, Kendal, and Mr. W. F. Y. Molyneux, surveyor, Town Hall, Ulverston.

LONDON.—Oct. 11.—For the builders' work necessary in erection of a new plumber's shop, alteration to stores, &c., at the waterworks yards, for the Croydon Town Council. The Borough Engineer, Town Hall, Croydon.

LONDON.—Oct. 15.—For the extension of Battersea district post office, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. J. Rutherford, 22 Carlisle Place, London, S.W.

DEVELOPMENT OF ROME.

THE British Consul for Rome, Mr. C. C. Morgan, in his annual report, says:—The fiftieth anniversary of the proclamation of the unity of Italy encouraged the Government and municipal authorities to organise during 1911 an International Exhibition of Fine Arts, to which were added archaeological, historical, and other sections. It was hoped that, quite independently of the patriotic aspect of the exhibition, the trade of Rome would have benefited by the influx of a large number of visitors. Unfortunately, an exaggerated scare as to the sanitary conditions of the country and other minor causes kept the long-expected visitors away from Rome. Few works of art, consequently, found a purchaser, and although accounts have not yet been published it is held that from a financial point of view the exhibition was not a success, despite the most praiseworthy activity displayed by the city authorities. By general consensus the British section was held to furnish the best examples of contemporary art among the numerous sections which constituted the exhibition.

Elsewhere in his report Mr. Morgan says:—One of the causes which in the past retarded the industrial development of Rome has been the want of fuel, which had to be imported from a distance, and its price consequently hampered would-be manufacturers. Of late years, however, the water resources of the district have been largely utilised. It is calculated that about 65,000 electric horse-power are at present available for private consumption. The aggregate quantity is 85,000 horse-power, of which 70,000 horse-power are hydro-electric and the rest obtained by steam. The tram company absorbs 6,000 horse-power, private consumption 14,000 horse-power, thus leaving over 60,000 horse-power available for general industrial purposes. The advocates of the progress of the Italian capital expect that as soon as the conditions will permit it, the Act granting certain fiscal exemptions to new industrial concerns in the Neapolitan districts will be extended to Rome. Such a course would undoubtedly give a powerful stimulus to local economy.

There is no indication, Mr. Morgan continues, of any abatement in the demand for apartments, and house rents continue to rule very high. The cost of commodities has risen with the rates of wages, for which the labouring classes have agitated for so long without their taking into proper account the inevitable sequel which has made their bread, their meat, and all the other necessities dearer to almost a prohibitive degree. The gradual increase of population has also contributed to raise the price of commodities, as has also the large number of well-to-do visitors who are not so fastidious in their expenditure, especially when they come here for a short stay. There is also the adverse factor that the bulk of supplies has to be imported from outlying dis-

tricts, local production in connection with edibles being quite inadequate. It is calculated that the cost of living has trebled in Rome during recent years.

The sanitary progress of the district is very markedly borne out by the following returns of deaths, giving comparative figures at certain dates:—Rate of mortality per 1,000 inhabitants: Rome, annual rate in the years 1871-75, 33.7, annual rate in the years 1906-10, 18.9; Perugia, 27 and 19.3; Macerata, 27 and 19.9; Ascoli, 27.2 and 19.7. There are very few large Continental cities that seem to be able to vie with the Italian capital in point of health, and great credit is due to the local authorities for their successful efforts in reducing the old high rate of mortality to the present figure.

TRADE NOTES.

LAKE HOUSE, Salisbury, which was recently destroyed by fire, is now being restored. Messrs. Cubitt & Co. are the builders. Chilmark stone is being used, and this is all being worked at the quarries by Messrs. T. T. Gething & Co., Ltd.

A USEFUL little booklet is being issued by the British Thomson-Houston Co., the proprietors of the Mazda lamp. The cost is clearly given on the cover as priceless. A postcard will purchase a copy. Ask for "The Lighting News"; contains electric light terms, how to read your electric light meter, and a light in the coal-cellar, &c.

MESSRS. WM. RIDER & SONS, LTD., the publishers of our contemporary *The Timber Trades Journal*, inform us that they are removing their London offices to Cathedral House, 8 to 11 Paternoster Row, E.C. Their telephone number is 647 Holborn, and their telegraphic address will, of course, remain as "Riderwood, London."

MESSRS. BENHAM & SONS, LTD., 66 Wigmore Street, London, W., are at present installing the "Perfect" system of hot-water heating at the following:—Hydro Hotel, Eastbourne (Mr. J. W. Woolnough, architect); offices, 31 and 33 Lime Street, Holborn, E.C. (Messrs. Fair & Myer, architects); Messrs. Jurgens' premises, Snow Hill, E.C. (Mr. Herbert Knight, architect); Avington Park, Alresford (Messrs. Millar & Cox, architects); The Gate of St. John, Ryde (Messrs. Albury, Rising & Morgan, architects); additional premises, Brooke Street, Holborn, W.C. (for the Prudential Assurance Co.); Flesk, Burnham, Somerset (for Mrs. Coxon); factory premises, Great Eastern Street, E.C. (for Mr. Charles Alstrom); All Saints Church, Goodmayes (Mr. P. K. Allen, architect); and Minerva Buildings, Tottenham Court Road (Mr. George Vernon, architect).

DOVER Harbour Board intend to spend £200,000 on increased dock accommodation, principally to deal with the coal export traffic.

OWAIN GLYNDWR'S PARLIAMENT HOUSE.—BACK VIEW BEFORE RESTORATION; (See page 196.)

A COMPREHENSIVE SUBWAY SYSTEM IN CHICAGO.

IN accordance with instructions from the City Council, the Harbour and Subway Commission of Chicago, in conjunction with a sub-committee of the committee on local transportation of the Chicago City Council, presented a joint report to the whole committee on September 10. In this report, says the *Engineering Record*, was outlined a proposed comprehensive system of passenger subways for the city of Chicago.

The sub-committee visited recently New York, Philadelphia and Boston. Its scheme for Chicago has been worked out on the theory, based on New York experience, that the capital cost of constructing Chicago's municipal subways can be provided for in full out of future earnings. The subway routes submitted are intended to be on a basis of absolute municipal ownership and control for all time of the leading arteries of transportation within the city limits. The initial routes have been laid out on the theory that they may prove to be trunk lines for future feeders and extensions.

A single universal 5-cent fare is proposed.

Considerable attention is paid to the financial aspects of the situation. If private capital is to be enlisted, alternative bids may be solicited on three proposals—first, for construction only; second, for construction and operation; and, third, for operation only. A sinking fund is proposed, so that at the end of a term of years the entire subway plants shall become the property of the people of Chicago.

A high level subway is proposed. There are to be no grade crossings, one subway dipping under another at street intersections.

The movements of the trains, supplemented by the action of centrifugal fans, is relied upon for ventilation.

As to utility galleries, no definite plans are proposed. In some cases it may be advisable to construct a compartment for this service, but generally the utilities may be diverted or placed in sub-surface space not required for subway use. Public service corporations have indicated a preference to move their underground utilities to other territory and to build and maintain their own conduits rather than to pay their proportion of the cost of a compartment in the subway. In Boston and New York no provision has been made in the subways for utilities.

The total cost of the subways proposed in the joint report is \$96,257,000. In addition to this the estimated cost of equipment is \$34,844,000. The equipment will be furnished by the operating company.

Alternating-current generation and distribution and direct-current operation of car motors are included in the proposal.

Steel cars with an approximate seating capacity of sixty passengers are contemplated.

The joint report recommends the construction of 56.42 miles of subway on a number of the principal streets of Chicago. Four track subways are suggested for Lincoln Avenue and in South State Street. All other subways are two-track construction. The longest single subway in a straight line is planned for Halsted Street, extending twelve miles. Besides the streets mentioned, subways are proposed in portions of fourteen other principal streets. It is calculated that the longest through ride on any subway line will be on the twelve-mile Halsted Street subway from Fullerton Avenue to Seventy-Ninth Street, and will take 40.2 minutes for local trains. On express trains it will take 18.7 minutes to go from Lawrence and Evanston Avenues to the centre of the city, and 29.3 minutes to go from Seventy-Ninth Street and Cottage Grove Avenue to the loop district.

The capacity of the subway system outlined in the report is estimated to be 180,000 seats per hour.

At the meeting of the full committee on September 10 it was voted that the report of the sub-committee be received (but not adopted) and that 25,000 copies be printed. It is probable that there will be full discussion of the report in the committee and in the City Council before any action is taken.

THE St. Helens Education Committee are informed that the Local Government Board has sanctioned the borrowing of £16,900 for the erecting of the Liverpool Road Council school.

THE Worcestershire City Council have instructed their Health Committee to prepare various schemes for the provision of central baths in addition to the two already submitted, which are estimated to cost £15,000 and £7,000 respectively.

DEVELOPMENT OF ROME.

THE British Consul for Rome, Mr. C. C. Morgan, in his annual report, says:—The fiftieth anniversary of the proclamation of the unity of Italy encouraged the Government and municipal authorities to organise during 1911 an International Exhibition of Fine Arts, to which were added archaeological, historical, and other sections. It was hoped that, quite independently of the patriotic aspect of the exhibition, the trade of Rome would have benefited by the influx of a large number of visitors. Unfortunately, an exaggerated scare as to the sanitary conditions of the country and other minor causes kept the long-expected visitors away from Rome. Few works of art, consequently, found a purchaser, and although accounts have not yet been published it is held that from a financial point of view the exhibition was not a success, despite the most praiseworthy activity displayed by the city authorities. By general consensus the British section was held to furnish the best examples of contemporary art among the numerous sections which constituted the exhibition.

Elsewhere in his report Mr. Morgan says:—One of the causes which in the past retarded the industrial development of Rome has been the want of fuel, which had to be imported from a distance, and its price consequently hampered would-be manufacturers. Of late years, however, the water resources of the district have been largely utilised. It is calculated that about 65,000 electric horse-power are at present available for private consumption. The aggregate quantity is 85,000 horse-power, of which 70,000 horse-power are hydro-electric and the rest obtained by steam. The tram company absorbs 6,000 horse-power, private consumption 14,000 horse-power, thus leaving over 60,000 horse-power available for general industrial purposes. The advocates of the progress of the Italian capital expect that as soon as the conditions will permit it, the Act granting certain fiscal exemptions to new industrial concerns in the Neapolitan districts will be extended to Rome. Such a course would undoubtedly give a powerful stimulus to local economy.

There is no indication, Mr. Morgan continues, of any abatement in the demand for apartments, and house rents continue to rule very high. The cost of commodities has risen with the rates of wages, for which the labouring classes have agitated for so long without their taking into proper account the inevitable sequel which has made their bread, their meat, and all the other necessities dearer to almost a prohibitive degree. The gradual increase of population has also contributed to raise the price of commodities, as has also the large number of well-to-do visitors who are not so fastidious in their expenditure, especially when they come here for a short stay. There is also the adverse factor that the bulk of supplies has to be imported from outlying dis-

tricts, local production in connection with edibles being quite inadequate. It is calculated that the cost of living has trebled in Rome during recent years.

The sanitary progress of the district is very markedly borne out by the following returns of deaths, giving comparative figures at certain dates:—Rate of mortality per 1,000 inhabitants: Rome, annual rate in the years 1871-75, 33.7, annual rate in the years 1906-10, 18.9; Perugia, 27 and 19.3; Macerata, 27 and 19.9; Ascoli, 27.2 and 19.7. There are very few large Continental cities that seem to be able to vie with the Italian capital in point of health, and great credit is due to the local authorities for their successful efforts in reducing the old high rate of mortality to the present figure.

TRADE NOTES.

LAKE HOUSE, Salisbury, which was recently destroyed by fire, is now being restored. Messrs. Cubitt & Co. are the builders. Chilmark stone is being used, and this is all being worked at the quarries by Messrs. T. T. Gething & Co., Ltd.

A USEFUL little booklet is being issued by the British Thomson-Houston Co., the proprietors of the Mazda lamp. The cost is clearly given on the cover as priceless. A post-card will purchase a copy. Ask for "The Lighting News"; contains electric light terms, how to read your electric light meter, and a light in the coal-cellar, &c.

MESSRS. WM. RIDER & SONS, LTD., the publishers of our contemporary *The Timber Trades Journal*, inform us that they are removing their London offices to Cathedral House, 8 to 11 Paternoster Row, E.C. Their telephone number is 647 Holborn, and their telegraphic address will, of course, remain as "Riderwood, London."

MESSRS. BENHAM & SONS, LTD., 66 Wigmore Street, London, W., are at present installing the "Perfect" system of hot-water heating at the following:—Hydro Hotel, Eastbourne (Mr. J. W. Woolnough, architect); offices, 31 and 33 Lime Street, Holborn, E.C. (Messrs. Fair & Myer, architects); Messrs. Jurgens' premises, Snow Hill, E.C. (Mr. Herbert Knight, architect); Avington Park, Alresford (Messrs. Millar & Cox, architects); The Gate of St. John, Ryde (Messrs. Albury, Rising & Morgan, architects); additional premises, Brooke Street, Holborn, W.C. (for the Prudential Assurance Co.); Flesk, Burnham, Somerset (for Mrs. Coxon); factory premises, Great Eastern Street, E.C. (for Mr. Charles Alstrom); All Saints Church, Goodmayes (Mr. P. K. Allen, architect); and Minerva Buildings, Tottenham Court Road (Mr. George Vernon, architect).

DOVER Harbour Board intend to spend £200,000 on increased dock accommodation, principally to deal with the coal export traffic.

OWAIN GLYNDWR'S PARLIAMENT HOUSE.—BACK VIEW BEFORE RESTORATION; (See page 196.)

A COMPREHENSIVE SUBWAY SYSTEM IN CHICAGO.

In accordance with instructions from the City Council, the Harbour and Subway Commission of Chicago, in conjunction with a sub-committee of the committee on local transportation of the Chicago City Council, presented a joint report to the whole committee on September 10. In this report, says the *Engineering Record*, was outlined a proposed comprehensive system of passenger subways for the city of Chicago.

The sub-committee visited recently New York, Philadelphia and Boston. Its scheme for Chicago has been worked out on the theory, based on New York experience, that the capital cost of constructing Chicago's municipal subways can be provided for in full out of future earnings. The subway routes submitted are intended to be on a basis of absolute municipal ownership and control for all time of the leading arteries of transportation within the city limits. The initial routes have been laid out on the theory that they may prove to be trunk lines for future feeders and extensions.

A single universal 5-cent fare is proposed.

Considerable attention is paid to the financial aspects of the situation. If private capital is to be enlisted, alternative bids may be solicited on three proposals—first, for construction only; second, for construction and operation; and, third, for operation only. A sinking fund is proposed, so that at the end of a term of years the entire subway plants shall become the property of the people of Chicago.

A high level subway is proposed. There are to be no grade crossings, one subway dipping under another at street intersections.

The movements of the trains, supplemented by the action of centrifugal fans, is relied upon for ventilation.

As to utility galleries, no definite plans are proposed. In some cases it may be advisable to construct a compartment for this service, but generally the utilities may be diverted or placed in sub-surface space not required for subway use. Public service corporations have indicated a preference to move their underground utilities to other territory and to build and maintain their own conduits rather than to pay their proportion of the cost of a compartment in the subway. In Boston and New York no provision has been made in the subways for utilities.

The total cost of the subways proposed in the joint report is \$96,257,000. In addition to this the estimated cost of equipment is \$34,844,000. The equipment will be furnished by the operating company.

Alternating-current generation and distribution and direct-current operation of car motors are included in the proposal.

Steel cars with an approximate seating capacity of sixty passengers are contemplated.

The joint report recommends the construction of 56.42 miles of subway on a number of the principal streets of Chicago. Four track subways are suggested for Lincoln Avenue and in South State Street. All other subways are two-track construction. The longest single subway in a straight line is planned for Halsted Street, extending twelve miles. Besides the streets mentioned, subways are proposed in portions of fourteen other principal streets. It is calculated that the longest through ride on any subway line will be on the twelve-mile Halsted Street subway from Fullerton Avenue to Seventy-Ninth Street, and will take 40.2 minutes for local trains. On express trains it will take 18.7 minutes to go from Lawrence and Evanston Avenues to the centre of the city, and 29.3 minutes to go from Seventy-Ninth Street and Cottage Grove Avenue to the loop district.

The capacity of the subway system outlined in the report is estimated to be 180,000 seats per hour.

At the meeting of the full committee on September 10 it was voted that the report of the sub-committee be received (but not adopted) and that 25,000 copies be printed. It is probable that there will be full discussion of the report in the committee and in the City Council before any action is taken.

THE St. Helens Education Committee are informed that the Local Government Board has sanctioned the borrowing of £16,900 for the erecting of the Liverpool Road Council school.

THE Worcestershire City Council have instructed their Health Committee to prepare various schemes for the provision of central baths in addition to the two already submitted, which are estimated to cost £15,000 and £7,000 respectively.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

BERKSHIRE.

Reading.—Kendrick Boys' and Girls' Schools, Sidmouth Street and London Road.

BUCKINGHAMSHIRE.

Boveney.—House for Mrs. Tough.

Cippenham.—Two cottages, Cippenham Lane, for Mr. S. Westron.

Denham.—House for Mr. F. Burness.

Iver Heath.—Additions to "Dell Cottage" for Mr. T. Mosley, C.B.

Langley.—Two pairs of houses, Elmhurst Road, for Mr. W. J. McCormack.

Alterations to "Love Hill House," for Mr. J. Wardrop.

Wymcombe.—Two houses and workshop, Desborough Road and Richardson Street, for Mr. A. W. Nash.

House and additions to works, London Road, for Mr. Bateman.

CORNWALL.

Truro.—Diocesan Training College: Chapel (£1,200).

Vernan.—St. Symphorian Church restoration (£1,300).

CUMBERLAND.

Maryport.—National Schools: alterations and improvements.

DERBYSHIRE.

Belper.—Mission Church, Cow Hill (£1,300). Messrs. Hunter & Woodhouse, architects.

DEVON.

Barnstaple.—Four houses, Yeo Vale Road. Messrs. Oliver & Son, architects; also

Alteration to house, Orchard Terrace.

Parish Room, St. Mary's Churchyard.

Exeter.—Devon Bacon Factory.

"Falmouth Inn," Cowick Street: re-building. Mr. C. Cole, architect.

DORSET.

Bridport.—Eleven working-men's model cottages (£2,100).

DURHAM.

Gateshead.—Workhouse Laundry: alterations. Messrs. Newcombe (F.) & Newcombe (A.R.I.B.A.), of Newcastle-upon-Tyne, architects.

Ushaw Moor.—St. Luke's Church. Mr. W. H. Wood, F.R.I.B.A., superintending architect (£2,000). Messrs. Rutter & Sons (of Esh), contractors.

ESSEX.

Barnston.—Church of England schools: improvements.

Brentwood.—Girls' Secondary school.

Chadwell St. Mary.—Council school for 250 places.

Harwich.—Elementary Council school for 500 boys and girls.

Ilford.—Dust destructor, Seven Kings.

Leyton.—Mission Hall, Bloxhall Road, for All Saints' and Emmanuel Church (£1,700).

South Benfleet.—Council school enlargement (£1,850). Mr. L. Weasey, architect.

Southend-on-Sea.—County High school for 300 girls (£18,700).

West Thurrock.—Infants' Council school for 200 places.

GLOUCESTERSHIRE.

Oldland.—Parish Club and Hall (£1,600).

Thornbury.—Workhouse Infirmary extension (£950).

KENT.

Erith.—House, Lesney Park Road, for Mr. A. Downton. Alterations to Offices, Manor Road, for the British Fibro-Cement Syndicate. Messrs. G. H. Gunning & Sons, architects.

Gravesend.—Six houses, Cross Lane, for Mr. W. R. Barton.

Sevenoaks.—Houses, Bradbourne Road, for Mr. G. E. Presland.

House, Vine Avenue, for Mr. F. Brooker.

LANCASHIRE.

Manchester.—His Majesty's Theatre, Deansgate.

Turton.—Cotton weaving shed for the Turton and Edgworth Mill Building Co.

Wigan.—Sanatorium.

Council school, Beech Hill. Messrs. J. B. & W.

Thornley, architects.

Girls' High school.

Winwick.—Asylum: Nurses' Home extension (£2,200).

LEICESTERSHIRE.

Hinckley.—Ten working-class houses. Council surveyor.

MIDDLESEX.

Harefield.—"The Swan" P.H.: rebuilding, for Messrs. T. Wethered & Sons.

MONMOUTHSHIRE.

Talywain.—The "Commercial Inn": alterations. Mr. T. Roderick (of Aberdare), architect.

NORTHAMPTONSHIRE.

Raunds.—Public Elementary school. Messrs. Blackwell & Riddey (of Kettering), architects.

NORTHUMBERLAND.

Willington Quay.—St. Aidan's R.C. Church: infants' school (£1,400).

NOTTINGHAMSHIRE.

Nottingham.—Mansfield Road Baptist church and schools, Gregory Boulevard and Sherwood Rise. Messrs. Sutton (F.R.I.B.A.) & Gregory, architects. Mr. J. Wright, contractor (£8,000).

Booth Memorial Hall.

Y.M.C.A. Building.

Walsingham.—Infectious diseases hospital.

SOMERSET.

Taunton.—Cinematograph Theatre, Swimming and Turkish Baths, North Street (£10,000).

SURREY.

Camberley.—Wesleyan Church (£2,500).

Croydon.—St. Stephen's Church, Norbury: completion (£3,700). Mr. W. S. Weatherley, F.R.I.B.A. (of London), architect. Mr. E. J. Saunders, contractor.

Guildford.—House, Ennismore Avenue, for Messrs. Rutter & Co.

House, Weston Road, for Mr. G. Reeve.

Stoughton.—Three pairs of cottages, Barrack Road, for Messrs. R. Wood & Son.

SUSSEX.

Hastings.—"The Convent of the Holy Child," Magdalen Road: additions. Messrs. Adams & Jarrett, builders.

"The Metropole," Robertson Terrace: additions and alterations. Mr. F. Plowman, architect.

No. 26 Robertson Street: alterations. Mr. H. Ward, A.R.I.B.A., architect.

Laundry, York Road: additions. Messrs. A. W. Jeffrey & Son, architects.

WARWICKSHIRE.

Birmingham.—Workhouse: alterations and extensions, Western Road (£6,100).

Destructor works, Aston Church Road, Nechells: additional stabling (£2,300).

Electricity generating station, Summer Lane: Boiler-house (£12,900).

Chilvers Coton.—Church near Edward Street.

Erdington.—Public Elementary school.

WORCESTERSHIRE.

King's Norton.—Destructor works, Lifford: additional stabling (£4,700).

YORKSHIRE.

Cowling.—House, Fold Lane. Mr. J. Hartley (of Skipton), architect.

Hebden Bridge.—Royal Electric Theatre: extensions, for Messrs. Wadsworth & Shaw.

Hemsworth.—Workhouse: additions (£8,400).

Linthwaite.—House and shop, Hoylehouse. Mr. A. E. Rodgers (of Milnsbridge), architect.

Malton.—"New Globe Inn": additions and alterations.

Rotherham.—Rescue Station, Effingham Street and St. Ann's Road.

WALES.

Llanelli.—Boy Scouts' Hall, Murray Street (£4,000).

Port Talbot.—The "Temple of Fashion," Aberavon. Mr. F. B. Smith, architect.

Swansea.—Cinema Theatre, High Street.

SCOTLAND.

Airdrie.—Court House extension.

Dundee.—St. John's (Cross) Parish Church, Blackness Avenue. Messrs. H. & F. Thomson, architects.

Dunfermline.—Carnegie Trust College of Hygiene and School Clinics (£20,000).

Glasgow.—Electricity and generating station and water-cooling tower, Clutha Works, M'Lellan Street, Plantation, for Messrs. P. & W. M'Lellan.

Picture house and shops, Nos. 729 and 731 Govan Road, for the Govan Central Picture House, Ltd.

Works, No. 50 Helen Street: extensions for Messrs. R. Potter & Sons.

SCOTLAND—continued.

Greenock.—Showrooms, West Blackhall Street, for the Greenock Gasworks (£2,000).
Harris.—Academy extension (£15,000).
Riccarton Junction.—Board School.

IRELAND.

Ballymena.—Workhouse Infirmary. Messrs. Patterson & Grahame (of Belfast), architects.
Belfast.—Three houses, Ulster Avenue, for Mr. B. Stafford.
 House, Knutsford Drive, for Messrs. R. J. McConnell & Co.
 House, Onslow Gardens, for the Martin Estate Co., Ltd.
 Two houses, Kerrsland Parade, for Messrs. T. Henderson & Co.
 House, Ravenhill Park, for Messrs. R. J. McConnell & Co.
 Two houses, Oldpark Road, for the Print Works Co., Ltd.
 House, Westland Road, for Messrs. R. J. McConnell & Co.
 Nine houses, Bristol and Court Streets, for Mr. H. Barron.
 School, Edinburgh Street, for the Ulsterville Presbyterian Church.
 National School. Mr. J. L. McDonnell, M.R.I.A.I., architect. Messrs. R. Corry, Ltd., contractors.
Brittas.—Sanatorium, Crooksling: extensions for the Dublin Joint Hospital Board.
Cork.—Cinematograph Theatre. Messrs. A. & H. Hill, architects.
 Cinematograph Theatre, Merchant Quay. Mr. Magahy, architect. Mr. D. Hegarty, contractor.
Dublin.—Sixty-three working-class dwellings, Weavers' Square (£11,500).
Pomeroy.—Church. Messrs. W. H. Byrne & Son (of Dublin), architects.
Queenstown.—Working-class houses (£7,000). Council engineer.
Tuam.—Artisans' dwellings (£8,000). Mr. P. Costelloe, C.E. (of Galway), architect.
Waterford.—Working-class dwellings (£21,000). Borough surveyor.

BUILDING CONSTRUCTION IN SOUTH CHINA.

THE United States Consul-General at Hong Kong, in a recent report to his Government, states that methods of building construction in Hong Kong and South China ports have undergone a great change during the last year or two. Formerly most buildings were made of brick or stone, and the use of steel in construction was exceptional, but very few big buildings have been constructed recently in which structural steel was not used, and the use of reinforced concrete is becoming more and more general. European metal is preferred for concrete reinforcement of heavier types, but American materials are chiefly used for the reinforcement of floors, ceilings, and non-bearing walls, also for bridges, galleries, verandahs, &c. Plans for construction work of all kinds in both Government and private enterprises under the new régime at Canton and in other ports call for an increased use of these materials. There are no reliable data as to the present volume of this demand, but it is considerable, and will, according to the report, undoubtedly increase greatly in the near future.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Root, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 28,888. Dec. 22, 1911.—Improvements in Concrete Piles for Foundations and similar purposes. G. C. Vernon-Inkpen, 40 Commercial Road, Portsmouth, Hants, architect. This invention has for its object the employment of steel of ordinary commercial sections to resist tensile and torsional strains for the reinforcement of concrete screw piles so arranged and disposed as to be easily and economically assembled to simplify its construction, and so capable of being formed together without requiring specially skilled labour for the purpose in the construction of a completed

reinforced concrete pile or column. This invention particularly relates to worms, flanges, or blades for use in secur-

FIG. 1.

FIG. 2.

ing foundations for walls, piers, columns and quays for works of a subaqueous nature, or in soils above the surface of water, particularly through marshy or boggy stratus. Fig. 1 is a sectional elevation of the pile shaft and reinforcement of the concrete screw flanges or blades. Fig. 2 is a sectional plan of the same. Fig. 5 is an elevation of the pile.

FIG. 5.

h is the helical coil reinforcement of the pile shaft to resist torsion wound in the reverse direction to that of the screw thread, being continuous in length and preferably formed with a number of metal rods interlaced, or otherwise perforated or expanded metal strands of wire or bands is the steel-pointed shoe. i is the steel rod or bolts with forked end. j is the radiating arm passing through concrete pile mass. k is the radiating arm with split or forked end in concrete pile mass. July 24, 1912.

PATENT SPECIFICATIONS PUBLISHED SEPTEMBER 26, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 19,234. Aug. 28, 1911.—G. L. Gilberthorpe, Claude Street, Chatswood, and H. C. Marshall, Fullers Road, Chatswood, near Sydney, New South Wales. Collapsible sliding gates and barriers.

19,280. Aug. 29, 1911.—Percy Knowles, 2a Church Street, Isleworth, Middlesex. Surfaces for the transmission of heat.

19,462. Aug. 31, 1911.—Date claimed under International Convention Sept. 20, 1910. August Wolf, Government architect, 7 Jockmanstr., Liegnitz, Germany. Tools for boring earth and soft rocks.

19,927. Sept. 7, 1911.—W. J. Earles, the Alexandra Palace Hotel, Station Road, Wood Green, N.; Hugh Robertson, High View, Enfield Highway, N.; F. F. Mote, 90 Woodside Road, Bowes Park, N.; and T. A. Cartwright, 76 Woodside Road, Bowes Park, N. A turpentine substitute for paint, &c.

19,939. Sept. 7, 1911.—Parkinson and W. & B. Cowan, Ltd., Bellbarn Road Works, Birmingham, and S. B. Langlands, 52 College Street, Glasgow. Lighting devices for street and analogous incandescent gas lamps.

19,972. Sept. 7, 1911.—J. Stone & Co., Ltd., Deptford, S.E., and E. C. MacCormac, 122 Harborough Road, Streatham. Flushing syphon especially applicable to sewage tanks.

20,137. Sept. 11, 1911.—Florencio Escalada, the Waldorf Hotel, Aldwych. Lifts, hoists, water-raising devices, and so forth.

20,155. Sept. 11, 1911.—Date claimed under International Convention March 8, 1911. Daimler-Motoren-Gesellschaft, Fabrikstr., Unterturkheim, Germany. Anti-vibration or jamming device for doors.

21,103. Sept. 25, 1911.—James McCulloch, 1 Maxwell Place, Glasgow. Stoking device for use in connection with grates, stoves, and the like.

21,605. Sept. 30, 1911.—S. W. Cole, Wenlock Brewery House, Wenlock Brewery, City Road, N. Apparatus for washing or purifying and cooling air and gas.

21,939. Oct. 5, 1911.—Walter Jones, Titan Works, Amblecote, Staffs., and S. J. Sigismund Mills, Rose Cottage, South Avenue, Stourbridge. Double-faced sluice valves.

22,085. Oct. 6, 1911.—W. C. Johnson, Broadstone Farm, Coleman's Hatch, Sussex. Means for extinguishing fires.

22,792. Oct. 16, 1911.—Chas. Hickling, 90 Burford Road, Nottingham, and G. J. Tomlinson, 41 Orzen Street, Nottingham. Extraction of gases from sewage.

23,115. Oct. 19, 1911.—Georg Schiefferdecker, 21 Louisenstr., Posen, Germany. Window fastenings.

25,217. Nov. 13, 1911.—J. B. Kirby, Whitney Power Block, Cleveland, Ohio, U.S. Pneumatic cleaners.

25,439. Nov. 15, 1911.—Edward Ballard, 81 Avenue Road, King's Heath, Birmingham. Device for preventing the shaking and rattling of windows.

27,755. Dec. 11, 1911.—John Shanks, Tubal Works, Barrhead, Renfrewshire. Valve fittings for cisterns for flushing water closets, urinals, and the like.

4. Jan. 1, 1912.—George Emmerson, 3 Brook Road, and W. R. Moberley, Woodsetton, Worcestershire. Brick perforating machines.

CORRESPONDENCE.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Architects and Surveyors' Approved Society.

SIR,—I shall be glad if you will kindly grant me a short space to remind those who have applied for application forms for membership of the above Society that it is advisable that these forms should be filled in and returned at once, so that cards for the ensuing quarter (commencing October 13) may be issued to them. The daily additions to the membership list are exceedingly gratifying, but there are many persons connected with the architectural and surveying professions who are not yet members of any Society for the purposes of the Insurance Act, and I would urge them to apply for membership forms at once, as it is hardly necessary to point out that it is to their interest to join a Society which has been formed solely for their benefit.—Yours faithfully,

F. R. YERBURY,

Hon. Sec. (pro tem.).

18 Tufton Street, Westminster, S.W. :
October 3, 1912.

VARIETIES.

THE Scarborough Spa Company have sanctioned the expenditure of £8,000 on improvement schemes, which include the widening of the promenade and erection of a café.

A LOCAL GOVERNMENT BOARD inquiry has been conducted at Stamford into the application of the Town Council to borrow £5,500 for the extension of the sewage disposal works.

MR. ALFRED HANDS, M.I.E.E., F.R.Met.S., has been engaged to deliver lectures, illustrated by lantern slides and experiments, on "Thunder and Lightning," in a large number of towns in different parts of the country between October 7 and December 16.

THE Howden Rural District Council on Saturday decided to apply for a provisional order to acquire a site for a trial boring at Dale plantation, South Newbald, in connection with a water scheme estimated to cost £56,671. The engineer for the scheme is Mr. Percy Griffith, Parliament Street, Westminster.

MR. A. B. ROWE, architect, Worcester, has been appointed architect to the Worcestershire Territorial Association. The War Office have sanctioned the building in the county of drill halls at Bromsgrove, Redditch, Evesham, Pershore, and Tenbury, and have agreed to improvements to the Moseley Road (Birmingham) drill hall.

THE Perth School Board recommend the Education Department to approve a site at Muirton Bank as a site for the proposed academy for 700 pupils.

THE Bolton Electricity Committee have approved a scheme prepared by the borough electrical engineer for the construction of a large generating station at Back-o'-the-Bank. The cost, inclusive of plant, is put at £120,000.

A MEETING of the Orsett District Sub-committee was held at Grays last week. Tenders were opened for the erection of new Tilbury (Upper Ward) Council school. The lowest was that of Messrs. Brown Bros., for £3,150, as against the architect's estimate of £2,565. It was agreed that the tender should be referred to the architect.

THE Notts Education Committee, on the recommendation of the Buildings Sub-committee, as an economising experiment, have approved of a timber-framed school to accommodate sixty-four children at Bilsthorpe, the tender being let to Mr. J. Greenwood, of Mansfield, for £567 16s. 11d.

At a meeting of the Newcastle-on-Tyne Estate and Property Sub-Committee last week a plan was put forward for the development of the Walker Estate on garden city lines, fifteen houses to the acre. A suggestion for the erection of 9,000 modern houses was also put forward. No decision was come to, the matter being left for a printed report to be placed before the full Committee.

THE Local Government Board have officially communicated with the Town Clerk of Nottingham with reference to the improvement scheme of the City Council under the Housing Acts in respect of the Carter Gate and Manvers Street area. The Board have decided to confirm the scheme, and in due course a draft of the Order will be forwarded to the Council for their observations. The cost of the scheme is estimated at £139,933.

THE Chester Town Council have approved of a scheme under the National Insurance Act for a joint sanatorium district for the County of Cheshire and the county boroughs of Chester, Birkenhead, Stockport, and Stoke-on-Trent, and the borough of Wallasey. It is proposed to build a sanatorium for 150 beds at a cost of £25,000. Application will now be made to the Local Government Board to constitute a joint committee.

THE Staffordshire Education Committee have decided to recommend the County Council to purchase 4,840 square yards of land (mines and minerals being reserved) as the site of a new Council school at Halmerend, the price being 1s. per square yard; to purchase 5,657 square yards of land (including mines and minerals) at Fazeley for £300 as the site of a new infants' school; and to purchase 2,000 square yards of land (mines and minerals reserved) at 2s. a square yard, near Mount Pleasant Council school, as the site of a special subject centre at Quarry Bank.

LARGE new County school buildings at Hyde have recently been opened by the Chairman of the Cheshire County Council. For the exterior, red stock brick facings with biscuit-coloured terra-cotta dressings of varying shades, have been used, and a sea-green Westmorland slate for the roof. The design has as its distinguishing characteristic a symmetrical arrangement; simplicity and directness mark the plan. The general contractors were Messrs. S. Robinson, of Hyde. The whole work was from the designs and under the supervision of Mr. G. H. Willoughby, F.R.I.B.A., of Manchester.

Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie—Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the

second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ABERGAVERN.—Oct. 21.—For erection of a domestic arts centre at Abergavenny, for the Monmouthshire Education Committee. Deposit £1 1s. Mr. John Bain, F.R.I.B.A., County Council Offices, Newport.

Sun Patent Co.	890 0 0

PONTESFORD.

For the construction of new stables and garage. Messrs. DICKENS-LEWIS & HAYNES, architects, Shrewsbury.

Pace	£1,000 0 0
Bickerton	990 0 0
Bowdler & Co.	980 0 0
TREASURE & SON (accepted)	972 0 0

All of Shrewsbury.

PORTLAND.

For the erection of pumping station and cottage and other works, for the Urban District Council. Mr. R. S. HENSHAW, waterworks engineer, Portland.

Chamberlain	£8,541 0 0
Conway & Co.	8,419 0 0
JESTY & BAKER, Portland (accepted)	8,163 0 0

ROCHFORD.

For alterations and additions at the female infirmary block at the workhouse infirmary, for the Guardians. Mr. W. J. WOOD, architect, Southend-on-Sea.

MYALL BROS. (accepted)	£2,970 0 0
----------------------------------	------------

STONE.

For carrying out the Lightwood sewerage scheme.

TAYLOR & SON, Basford (accepted)	1,570 15 6
--	------------

SUTTON COLDFIELD.

For the erection of a lodge at Boldmere entrance to the park.

J. C. HILL, Sutton Coldfield (accepted)	£478 0 0
---	----------

WALES.

For erection of workhouse infirmary, for the Bangor and Beaumaris Guardians. Mr. FRANK BELLIS, architect, Bangor.

THORNTON & SONS, Liverpool (accepted)	£17,589 0 0
---	-------------

For the erection of thirty-one houses, for the South End Building Club, in continuation of Arthur Street, Tredegar. Mr. A. F. WEBB, M.S.A., architect and surveyor, Blackwood.

Arrowsmith	£253 7 6
Vodden	246 12 0
Newcombe & Son	220 0 0
W. & J. Jenkins	213 0 0
T. DICKINSON, Tredegar (accepted)	204 15 0

At a meeting on Tuesday of the Gloucester Board of Guardians it was reported that seventeen tenders had been received for the erection of the proposed workhouse infirmary, to accommodate 149 beds, for which Mr. W. B. Wood, A.R.I.B.A., of Gloucester, is the architect. The lowest tender was from Messrs. Byard & Son, Gloucester, amounting to £24,457, including provisional items such as heating, electric lighting, and sanitary fittings, cost of fencing and road making, bringing the total to £25,990. The highest tender was that of Messrs. Allen & Co., Westminster, £32,280, other tenderers including Messrs. Barnsley & Sons, Birmingham, £30,314; Messrs. Collins & Godfrey, Tewkesbury, £28,728; Messrs. Tilt Bros., Bromsgrove, £28,424; Messrs. Bowen & Sons, Birmingham, £27,829; and Messrs. Crane & Co., Ltd., Nottingham, £27,322. It was decided that, subject to the sanction of the Local Government Board, Messrs. Byard & Son's tender be accepted.

MR. RALPH HUDSON has been selected out of forty-six applicants for the post of surveyor and inspector of nuisances at Skegness. Mr. Hudson is at present chief assistant to the city engineer and surveyor at York.

PROPOSED COMPLETION OF "THE QUADRANT" REGENT ST. W., IN WITH

— Note — IT IS PROPOSED TO REMOVE THE 2 EXISTING ARCHES

INSTITUTION OF MUNICIPAL ENGINEERS.

A MEETING of the northern district of the Institution of Municipal Engineers was recently held in the Town Hall, Newcastle-on-Tyne.

A letter from Mr. Wyand respecting allowances to members for attending meetings in London came up for further discussion, and the following resolutions were passed:—

(1) "That the district secretary be deputed to attend a meeting of the Council with a view to discussing the question of the payment of at least a proportion of the travelling expenses of the distant members; (2) that the Executive Council be asked to consider the advisability of amending the rules of the institution with a view to adopting a system whereby each district would elect their own representatives on the Executive Council, the number of representatives to be in proportion to the number of members in each district; (3) that the meetings of the Council be movable, and at least one in every quarter be held in —."

It was agreed to hold a joint meeting with the Yorkshire division at Harrogate on October 19.

The Secretary introduced the question of securing grants from the Road Board for secondary or district roads, and explained the position in the county of Durham, at the same time pointing out that the probability of any Council obtaining a grant for district roads was very remote unless Councils and their surveyors protested very strongly against the Road Board allowing the County Council to have entire control of monies allotted to that county. It was decided to take the application for a grant for Morton Palms Road in the Darlington rural district as a test case, and members present pledged themselves to see the county representatives representing their various districts before the County Council meeting, and endeavour to persuade them to vote in favour of giving a grant to this particular road.

THE REBUILDING OF THE QUADRANT, REGENT STREET, W.

A suggestion for the rebuilding of The Quadrant, Regent Street, W., as a continuation of and in harmony with the design of the Piccadilly Hotel, by Messrs. James Young & Sons, architects.

In any design for the completion of The Quadrant, the Piccadilly Hotel being accepted as a *fait accompli*, two main points have to be considered—namely, first, that the continuation shall be suitable to the trade requirements of a large drapery concern, as no doubt the firm now occupying the major portion of the block would acquire the whole; and, secondly, that the architectural treatment at Air Street and the proper linking up of the hotel with the new block forms the key of the situation.

Accepting the position of trade requirements as a consideration requiring no discussion (as derelict property in all quarters and in quarters which would command premium rentals go to prove), the question is the combination of architecture and business, which ought not to be insuperable, and, so far as our solution goes on trade requirements, the tradesman might be the best judge.

From the architectural standpoint, and taking Air Street as the key of the situation, a central arch with side wings on either side, and with the building and roof carried over Air Street, as provided in the original design, is an absolute necessity, and no lowering of the roof at this point can be done without showing the end gable of hotel—which was, of course, never intended.

Taking this view in preparing our design, the difficulty was at once apparent—namely, that if the existing arch at the corner of Air Street were repeated on the other side, the carrying on of the present massive treatment of the hotel, with the inevitable repeat at the other end, at Piccadilly Circus—if no more—was involved. So to gain complete harmony with the main body of the hotel we commenced by removing the arch under the existing wing and substituting

WITH THE PICCADILLY HOTEL.

REPEATS FROM CENTRE LINE TO VIGO ST.
WITHOUT ARCHES & WITH $\frac{w}{2}$ SHOPS AS AT OTHER END.

THE Devon Education Committee were informed last week that tenders received for various works were from 10 to 50 per cent. above the estimates. Mr. P. Morris, A.R.I.B.A., the county education architect, stated that a dozen or more jobs have to be postponed owing to the amounts of the tenders exceeding the estimates.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

CHESHIRE.

Crewe.—Council School, Derby Street, for over 1,000 places.

Stockport.—District dispensary.

Wilmslow.—Conservative Clubhouse.

CORNWALL.

Falmouth.—Pair of semi-detached houses, Western Terrace. Mr. C. R. Corfield, A.R.I.B.A., architect.

Pair of semi-detached houses, Western Terrace, for Messrs. H. Thomas & Son.

Newquay.—Ten workmen's dwellings, St. John's Road. Council surveyor.

St. Austell.—Technical Institute, West Hill.

DERBYSHIRE.

Bakewell.—Council School.

Codnor Park and Ironville.—Conservative Clubhouse.

DURHAM.

Durham.—St. Margaret's Church hall (400 sittings). Mr. W. H. Wood, F.R.I.B.A., architect. Mr. C. W. Gibson, contractor.

ESSEX.

Coggeshall.—Council School.

Cold Norton.—Council School for eighty places.

High Ongar.—Children's Homes for the Board of Guardians, Herd's Farm site.

Hornchurch.—Cottages. Romford Council surveyor.

Maldon.—Sixteen houses, Cherry Garden Road (£2,640).

Mr. T. R. Swales, Borough surveyor.

Witham.—Infectious diseases hospital, Howbridge Hall Lane.

GLOUCESTERSHIRE.

Kempey.—Parish Church restoration (£1,600).

HAMPSHIRE.

Bournemouth.—Houses, plots 293 and 294, Bloomfield Avenue, for Mr. A. R. Houlton.

House, plot 72, Chessel Avenue, for Mr. T. Cole.

House, plot 19, Chessel Avenue, for Mr. R. Old.

House additions, corner of Grand and Pine Avenues, for Mr. E. G. Evans.

House, plot 13, Truscott Avenue, for Messrs. A. & W. King.

Houses, plots 4 and 16, Wentworth Avenue, for Messrs. Burridge & Bovill.

House, plot 5, Portman Crescent, for Mr. G. Dolman.

House, Belle Vue Road, for Captain Griffiths.

Additions to "Bracken Court," Branksome Wood Road, for Mr. G. R. McDougall.

House, plot 21, Cardigan Road, for Mr. A. Ellison.

Additions to "The Grange," Grange Road, for Mr. C. W. L. Jensen.

Four houses, plots 19-22, Guildhill Road, for Mr. J. Newbury.

House, plot 14, Herberton Road, for Mr. T. Coles.

House, plot 385, Lowther Road, for Messrs. Lambert & Sons.

House, Maxwell Road, for Mr. H. T. Welch.

Additions to No. 9 Naseby Road, for Mr. A. Harris.

Additions to "Overstrand," Roslin Road, for Mr. E. K. Cross.

Three houses, plots 51 and 62, Scotter Road, for Mr. J. Stacey.

Pair of houses, plot 38, Spurgeon Road, for Mr. J. Stacey.

House, plot 144, Strouden Road, for Mr. C. V. Miller.

Additions to No. 30 Tower Road, for Mr. T. Pope.

Additions to "Cotford" and "Worcester," West Hill Road, for Mr. W. Saunders.

Pair of houses, plot 208, Wheaton Road, for Mr. H. Lazenby.

Pair of houses, corner of Wheaton and Rebbeck Roads, for Mr. W. T. Boys.

Alterations to premises, corner of Old Christchurch and Post Office Roads, for Messrs. Parris Bank, Ltd.

Portsmouth.—Church of St. Alban, Copnor.

HEREFORDSHIRE.

Hereford.—Market Hall: alterations and repairs (£1,100).

Masonic Temple, Castle Street (£2,000).

KENT.

Faversham.—Baptist Church extension.

Gillingham.—The "Jolly Sailor" P.-H.: re-building.

St. Michael's.—House, Woodside, for Mr. Chase.

Tenterden.—Alterations to No. 2 Oaks Place, for Mr. R. Avery.

Council School.

National Schools: alterations.

Westgate-on-Sea.—Cottage, Waterworks Road, for Mr. Hutchins.

LANCASHIRE.

Bolton.—Cotton shed, Weston Street, for Messrs. Winder & McKean.

Additions to houses, Hawthorn Street, for Mr. R. G. Jones.

Twelve houses, Markland Hill Lane, for Messrs. J. Massey & Sons.

House, Junction Road, Deane, for Dr. J. E. Gould.

Twenty-four houses, Nunnery Road, Deane, for Mr. J. Higson.

Stretford.—Council School, Second Avenue, Trafford Park: enlargement by an additional eighty places.

LINCOLNSHIRE.

Lincoln.—Barracks: additions and alterations (£1,250). Workhouse infirmary.

MIDDLESEX.

Wood Green.—Town Hall: alterations and additions (£7,000).

NORTHAMPTONSHIRE.

Earls Barton.—Church Institute, Station Road (£600).

Mr. H. W. Sheffield, architect. Messrs. Elson & Knight, contractors.

Higham Ferrers.—Council Schools: re-modelling (£2,450).

SHROPSHIRE.

Dawley Parva.—St. Luke's Church: Sunday School.

STAFFORDSHIRE.

Cannock.—West Hill Council Schools: enlargement.

Rocester.—Council School for 122 places.

Tunstall.—Church.

Walsall.—Council Schools, Chuckery.

SURREY.

Croydon.—St. Paul's Church, Norfolk Road: additions, for Mr. J. H. Henwood.

Young People's Hall, Brighton Road, for Mr. W. Booth.

Four houses, Ashburton Avenue, for Messrs. Paish, Tyler & Co.

Eight houses, Ederline Avenue, for Mr. J. Watts.

Eleven houses, Kilmartin Avenue, for Mr. P. Richardson.

House, Grecian Crescent, for Mr. E. G. Soper.

House, Pollard's Hill North, for Mr. W. A. Brown.

Five houses, Blenheim Park Road, for Mr. J. Crampton.

Eleven houses, Headcorn Road, for Mr. W. Darnell.

Six houses, Northway Road, for Mr. G. J. Hall.

Three houses, Silverleigh Road, for Mr. P. Richardson.

Six houses, Whitworth Road, for Mr. C. S. Banks.

Three houses with shops, Shirley Road, for Mr. W. Hine.

Redhill.—Congregational Church: Sunday school alterations and extensions (£2,500).

SUSSEX.

Barns Green.—Congregational Mission Church.

Brighton.—Headquarters for the Imperial Cadet Corps (£2,500).

Haywards Heath.—Post Office, Boltro Road.

WARWICKSHIRE.

Bulkington (Nuneaton).—Council Elementary Schools: extension (£850).

Coventry.—Municipal Buildings. Messrs. Garratt, Simister, Buckland & Farmer (of Birmingham), architects. Messrs. Willcock & Co. (of Wolverhampton), contractors.

WESTMORLAND.

Kendal.—House, Old Hospital grounds. Mr. J. Stalker, architect.

YORKSHIRE.

Barnoldswick.—Parish Church.

Congregational Church and school, Gisburn Road (£6,000).

Birkenshaw.—House, Drub Lane. Messrs. Howorth & Howorth (of Cleckheaton), architects.

YORKSHIRE—continued.

Deusbury.—"Crown and Cushion" Inn, Bradford Road: re-building. Mr. J. L. Fox, architect.
Hulifax.—Cottage-flats, Wheatley. (Accommodation for 80 persons.)

WALES.

Blaenrhondda.—District and Fernhill workmen's Branch Institute. Mr. W. D. Morgan (of Pentre), architect.
Rhuddlan.—The "New Inn": extensions.

SCOTLAND.

Cupar.—House, Bonnygate, for Mr. J. J. Campbell. Separate trade contractors.
Dunbar.—Barracks: additions. Messrs. W. Cruickshanks & Sons (of Edinburgh), contractors.
Dundee.—Hippodrome Picture Theatre, Hawkhill: addition for Mr. A. Binnall.
Alterations to shop, Perth Road, for Messrs. A. & R. Licksey.
Stobswell Works: addition for the Buist Spinning Co., Ltd.
Edinburgh.—Sheriff Court extension.
Glasgow.—Twelve self-contained houses. Mr. G. Allan, builder.
Greenock.—Artisans' and asylum attendants' houses (£5,000).
Phthisis isolation blocks for the Combination Hospital Board.
Monkton and Prestwick.—Church Hall, Alexandria Avenue, Prestwick (£1,200).
Rosyth.—Naval Institute (£15,000).

IRELAND.

Ardglass.—Shop and dwellings. Messrs. Browne Bros., architects.

PATENT SPECIFICATIONS PUBLISHED
OCTOBER 3, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 3,441. Feb. 10, 1912.—J. E. Caps, 329 Fourth Street, Wilmette, Cook, Illinois, and C. A. Cartwright, 500 W. Huron Street, Chicago, U.S.A. Systems of heating water and an apparatus therefor.

8,154. April 4, 1912.—W. & F. Walker, Ltd., and J. T. Freestone, Colonial House, Water Street, Liverpool. Charging air with sanitary or hygienic or aromatic vapour.

9,638. April 23, 1912.—Carter White and J. W. Patterson, 121 Grosvenor Park, S.E. Manufacture of white lead.

10,710. May 6, 1912.—Josef Weicht, Sebnitz, Saxony. Window and like fastenings.

10,844. May 7, 1912.—J. A. Dunning, Bertie, North Carolina, U.S.A. Dies for machines for working clay.

13,200. June 5, 1912.—J. C. Harrison, William Killey, and H. P. M. Fenton, Monarch Works, 12 Charles Street, Chorlton-on-Medlock. Flushing tanks.

13,477. June 8, 1912.—Eduard Schmelz, 39 Emmersanstr., Mayence, and August Schnepf, Bretzenheim, near Mayence, Germany. Repairing corrugated iron roofs.

16,526. July 15, 1912.—Rudolf Bachmann, 18 Kettenbrückengasse, Vienna IV. Ruling devices for preparing drawings.

19,853. Sept. 6, 1911.—Date claimed under International Convention Sept. 6, 1910. Emile Klée, 12 Rue de la Pepiniere, Brussels. Hollow reinforced concrete floors and ceilings.

20,172. Sept. 11, 1911.—A. F. Berry, 27 Woodville Road, Ealing, W. Electrically heated cooking ovens.

20,196. Sept. 12, 1911.—J. H. Bennetts, 228 Maryvale Road, Bournville. Method of securely fixing door and similar furniture to their respective latch and the like spindles.

20,202. Sept. 12, 1911.—J. W. Moseley, Pennine Edge, Romiley, Cheshire. Wall constructions for houses and other buildings.

20,267. Sept. 12, 1911.—A. H. Mitchell, 25 Wrottesley Road, Plumstead. Luffing cranes.

20,535. Sept. 16, 1911.—A. Wiefenbach, 1730 First Avenue, So. Seattle, King, Washington, and M. J. Farrell, 300 Thirty-Fifth Avenue, So. Seattle, Washington, U.S.A. Composition for plaster.

20,630. Sept. 18, 1911.—F. Skillbeck, The Bungalow, Etherley Lane, Bishop Auckland. Plastic composition for roads, footpaths, roofs, &c.

21,200. Sept. 26, 1911.—F. C. Le Bailly, 15 Bond Street, St. Helier, Jersey. Mode of glazing roofs, windows and the like.

21,550. Sept. 30, 1911.—F. H. Shorland, the Manchester Stove Works, Oldham Road, Failsworth, near Manchester. Fireplaces.

21,866. Oct. 4, 1911.—I. H. Storey, White Cross Mills, and W. E. McCalla, Queen's Mill, Lancaster, and A. Griffiths, Burton Grange, Burbage Road, Herne Hill. Facing plates for attaching to the surfaces of walls.

23,524. Oct. 24, 1911.—William Goodwin, 36 Lime Street, E.C. Elevator.

NEW CATALOGUES.

MESSRS. CHANCE BROTHERS & CO., LTD., Glass Works, near Birmingham, are to be warmly congratulated on the catalogue de luxe which illustrates their vitreous tiles and mosaic. Vitreous tiles are available for walls, floors, ceilings, and fireplaces. It is unfortunate that this highly artistic method of decoration is as costly as it is. Apparently it must still remain outside the reach of the humbler houseowner so long as the only quality is the best. Messrs. Chance make their tiles of solid glass throughout, and the colour goes right through the substance. It is, of course, on their colour and grain that this material depends for effect. The catalogue convincingly shows how well the architect is now served. Some of the dado designs are as remarkable for beauty as for restraint, the colours subtly blending and the patterns pleasantly contrasting. The tiles, being non-absorbent, are available for exterior, as well as inside use. They are made in two forms: (1) with regular edges, and (2) with antique rough-cut edges, giving an irregular jointing. A special feature is made of the regular-edge moulded tiles, cappings, and skirtings. The second half of the catalogue is devoted to vitreous mosaic, which is manufactured both in square cubes and in irregular-shaped tesserae. Besides making an artistic flooring, the mosaic can be very effectively employed for fascias, signs, name-boards, &c. Here, again, the makers get a wide variety of tints, and are enabled to provide an infinite variety of pattern. The catalogue is most excellently produced, and is worthy of the reputation of the firm. A copy will be sent to any architect on application.

Although the Old Delabole Slate Co., Ltd., possess quarries which were being used some centuries ago, it is obvious that the present year finds them as much alert and as eager to oblige as if they had to establish a new business. Their latest booklet, No. 96, is in every way an attractive compilation. It is full of wise saws, interesting photographs, and convincing arguments. The ordinary half-tone or black and white illustration cannot do justice to a roof covering, which necessarily depends for its effect on texture. Realising this fact, the Company have included a very delicately coloured representation of three varieties of the slates obtained at Delabole—viz., the uncommon "Greens," the still rarer "Reds," and the familiar "Green-Grey." No one can now say that slates must be hard and unsympathetic in appearance. If rightly selected and rightly used, this material is capable of most artistic results. There is a special art in designing a slate roof, as well as in choosing the best covering. The Old Delabole Slate Co. help the architect in no small degree by laying out his roof. If a plan of the roof is sent to them, no matter what the shape, their "roof-planning department" lay it out in graduated courses with slates of varying lengths and breadths. These Cornwall quarries have a fine record behind them, and we believe the future will bring even greater success.

Modern liners have often been called floating hotels, and the story of their sumptuousness has long aroused the wonder, if not the envy, of the untraveller. But there is one convenience which is no longer a luxury, for it has almost become a necessity, and that is a lift. The pioneers in this class of engineering work are Messrs. R. Waygood & Co., Ltd. An illustrated pamphlet, entitled "Lifts on Liners," gives a comprehensive survey of their many achievements in this direction. The first ocean liner to be provided with an electric passenger lift was the ss. *Amerika*, of the Hamburg-American line. The same company are installing three Waygood passenger lifts on the *Imperator*, which will be the largest passenger vessel afloat. The huge *Olympic* (the largest steamer afloat at the present time) has three first-class passenger lifts, one second-class lift, and four Waygood service lifts.

A DEVELOPMENT IN GAS ENGINE DESIGN.

It has been generally understood that Messrs. Mather & Platt, Ltd., after experimenting with a new design of vertical gas engine, have progressed so far as to have five in successful operation, three of them running day and night at a large local works, while the last, after a series of most exacting trials in their shops, is now in course of erection at a local colliery.

The engine was described before the Iron and Steel Institute last week by Mr. A. E. L. Chorlton, the inventor. It is claimed for the new design that it possesses features destined in a large measure to extend the application of gas power. Summarised, the claims are:—(1) That the new engine is a very beautiful example of mechanical design. (2) That it possesses features in regard to simplicity and facility for overhaul quite unique as compared with all other gas engines. (3) That it solves the problem of designing a high-power vertical gas engine without excessive multiplication of parts.

Three important advantages rising out of this design are:—

1. Every stroke is a driving stroke; therefore, the engine is both smaller and less costly than any other of equal rating. It is, indeed, anticipated that this design will place the gas engine on an equal footing with the steam engine in regard to capital cost per unit of power.

2. The cylinders are castings of the simplest outline and character, mounted bodily within a casing which forms the water jacket. They are quite free from intricate passages, thick flanges, or ribbing, such as introduce internal foundry stresses, and, being symmetrically heated and cooled during working, it is confidently anticipated that they will relegate that bugbear of the gas engine maker—cylinder cranks—to ancient history.

3. There is not a valve of the mushroom type on any part of the engine. The sleeve valve controlling the gas and air charges deals with these in cool condition, and, even if the worst happens—that is to say, if they occasionally have to run on tarry gas—less trouble is anticipated than with earlier arrangements.

These engines possess numerous other features of interest. The firm propose to manufacture the Duplex engines in powers up to 4,000 b.h.p., and higher should the necessity arise. They will be designed to run at fairly high speeds, and will thus be applicable to all duties for which vertical steam engines are now used.

COMPETITION NEWS.

GOOLE.—The Urban District Council, who intend erecting municipal offices in Goole Market Place, has adopted the final report from the assessor, Mr. C. B. Flockton, F.R.I.B.A., regarding the eighty designs submitted. The two premiums, respectively £30 and £15, are both awarded to Mr. Ernest E. Fetch, A.R.I.B.A., of London.

TRADE NOTES.

THE lead glazing for the new choir boys' hostel, Clumber, for the Duke of Newcastle, has been executed by Mr. Andrew Stoddart, The Studio, Nottingham, under the direction of Mr. F. E. Littler, A.R.I.B.A. Mr. Stoddart is also supplying all the steel casements and leadlights for the Secondary School, Ilkeston, in course of erection.

THE heavy rains of August and September will no doubt cause much trouble through the flooding of basements, cellars, garage pits and stoke-holes. Damp walls are being complained of both from rising dampness and from penetrating rains. The present time is, therefore, a good opportunity to try one of the well-known waterproofing preparations, which are mixed with the cement and the usual aggregates. These products give glowing accounts of their results, and we have every reason to believe they have been successful for the purpose of waterproofing cement.

UNDER the direction of Mr. H. R. Finn, Lic.R.I.B.A., architect, St. Albans, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "Air-pump" ventilators and air inlets, has been applied to the new Adult School, St. Albans.

THE whole of the heating, ventilating, hot-water supply, and cooking apparatus at the United Service Club, Pall Mall, S.W., is being carried out by Messrs. Benham & Sons, Ltd., under Messrs. Thompson & Walford, architects, and Messrs. Kirkland & Capper, consulting engineers. Messrs. Benham's "Perfect" accelerators are being used on the heating apparatus.

VARIETIES.

THE Local Government Board have sanctioned a provisional order to enable the Darlington Town Council to borrow a sum of £50,000 for waterworks.

THE Newcastle-on-Tyne Town Council have authorised their Property Committee to call in an architect to advise them as to the best method of reconstructing the Town Hall buildings.

THE Stoke-on-Trent Education Committee have received the sanction of the Local Government Board to the borrowing of £16,000 for the erection of the proposed central School of Science and Technology.

UNDER the Town-planning and Housing Act the Ellesmere Port District Council, sitting in committee, have decided to limit the number of houses built hereafter to twenty-four to the acre. The present average in streets within the district is forty.

THE Home Secretary has appointed a committee to inquire and report as to the precautions necessary in the use of celluloid in the manufacture and the handling and storage of celluloid and celluloid articles. The names of the committee are:—The Earl of Plymouth (Chairman), Professor J. J. Dobbie (principal Government Chemist), Captain Maurice B. Lloyd, Mr. H. M. Robinson (Deputy Chief Inspector of Factories), and Mr. Edwin O. Sachs (Chairman of the Executive of the British Fire Prevention Committee).

BOTH for sentimental and practical reasons, the approaching sale of the materials which were once the G.P.O. Buildings at St. Martin's-le-Grand must be of unusual interest. For nearly a century Sir Robert Smirke's bold design has been the admiration of all who saw it. It appears that this fine façade would be disposed of by special arrangement, or, failing that, the lofty and handsome Ionic columns will be for disposal separately. For builders, contractors and buyers there will be vast quantities of building material in good condition for sale on the site, including granite blocks, Portland stone (about 100,000 feet super in good plain square blocks of all sizes), forty nearly new 27-feet steel girders, roof principals, three glass covered ways, a ten-ton weighbridge, wood beams about 500 squares of York landings, splendid old stock bricks and screened broken brick. This important sale is in the hands of B. Goodman, housebreaker and cartage contractor, 38 Haggerston Road, Kingsland Road, N.E.

THE Council of the Institution of Civil Engineers have made the following further awards for papers read during the session 1911-12:—A Watt gold medal to Professor W. H. Burr (New York), and the Crampton prize to Professor R. J. Durley (Montreal). They have also awarded the following Telford premiums for papers published in the proceedings without discussion during the same session:—To Messrs. Paul Seurot (New York), David Anderson and Harry Cunningham (London), S. P. Smith, D.Sc. (Birmingham), E. G. Rivers, I.S.O. (Richmond) and E. H. Morris (Manchester), and Professor A. H. Gibson, D.Sc. (Dundee). The Howard Quinquennial prize for 1912 has been awarded to Mr. J. H. Darby (Sheffield), in recognition of improvement introduced by him in iron and steel production, and the Indian premium for 1912 to Mr. H. H. G. Mitchell (Madras). The Council have made the following awards in respect of students' papers read during the session 1911-12:—The "James Forrest" medal and a Miller prize to Mr. E. P. Curral, B.Sc. (Birmingham), and Miller prizes to Messrs. J. H. Taylor (Glasgow), W. P. Warlow, B.Sc. (Bristol), G. Ingram (London), E. F. Hunt, B.E. (London), H. J. F. Gourley, B.E. (London), H. G. Hoskings (London), E. A. Cross, B.Sc. (Birmingham), and J. & W. Legg (London), and the "James Prescott Joule" medal to Mr. V. E. Green (Birmingham).

THE Liverpool Cathedral Committee held a meeting on Monday at the Church House. It was reported that the chancel, the vestries, chapter house, and the ambulatory of the cathedral could be finished within three years, and that the committee had all the furniture and fittings promised, with the exception of the Bishop's throne. The chancel will accommodate a congregation of 417 without the side aisles. The committee have sufficient funds in hand to enable them to complete this portion of the work, but after that there will be only about £14,000 available towards providing adequate accommodation for the congregation. The committee have, nevertheless, decided to proceed with the building of the first of the transepts at a cost of £79,000, and thus afford further accommodation for about 1,500 persons. This particular work will be completed in about three years, so that the transept will be consecrated at the same time as the chancel. The committee will thus have to raise a further £65,000 within the next three years.

THE Architect and Contract Reporter.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers.

All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie-Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the

second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ABERFORD.—For the various works required in the additions to Aberford National schools, near Leeds. Mr. A. P. Harrison, M.S.A., architect, High Close, Keighley.

BANBURY.—Oct. 21.—For erection of forty cottages at Paradise Road (Messrs. G. Lucas & A. Lodge, architects, 14 Hart Street, Bloomsbury Square, W.C.). Send applications and £2 2s. deposit by Oct. 21 to Mr. A. Stockton, town clerk, Town Hall, Banbury. (See advertisement.)

BARNSELY.—For the whole or separate trades for the extension of the public baths in York Street. Send applications and £2 2s. deposit to the Town Clerk, Barnsley.

BRADFORD.—Oct. 22.—For erection of branch post office at St. James's Market, for the Corporation. The City Architect, Town Hall, Bradford.

BRADFORD.—Oct. 23.—For extension of Bradford County Court, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. The Registrar at Bradford

County Court, and H.M. Office of Works, &c., Storey's Gate, S.W.

CARLTON.—Oct. 22.—For the various works required in pulling down of existing property and the erection and completion of four cottages in Station Road, for the Urban District Council. Deposit £1 1s. Mr. J. Cracroft Haller, C.E., engineer and surveyor to the Council, Station Road, Carlton, Notts.

THE REGISTRATION OF PLUMBERS.

THE General Council for the National Registration of Plumbers met last week at the Council House, Bristol, the High Sheriff (Mr. R. E. Bush) presiding in the absence of the Lord Mayor. Representatives of public authorities and plumbers were present from all parts of the kingdom.

The High Sheriff said: "Everybody must agree that efficient plumbing work is a matter of vital importance from a health point of view, and the National Registration of Plumbers deserves all the aid and encouragement which can be given to it, not only by the authorities, but by everyone who has any regard for his own health and for the health of his neighbours."

The Council adopted the recommendation of a committee that, "In order that the public may have greater security for the efficiency of the sanitary appliances and water service in their houses, the work connected with such appliances and services may be so marked by registered plumbers that the names of the master plumbers or other employers, and also of the operative plumbers employed to execute the work, may be identified and recorded, and a check may thus be placed on the employment of unqualified or irresponsible persons to execute plumbers' work."

At the conclusion of the conference the Chairman (Mr. H. D. Searles-Wood, F.R.I.B.A.) made a statement with regard to the position of the building trade and the National Insurance Act, in which he said that one of the most important functions of the Act was the improvement of the public health. *Inter alia*, the Act empowered the insurance officers to arrange for the testing of the skill and knowledge of any insured workman whose repeated failure to obtain or retain employment appeared to be due to defects in those respects, and in suitable cases to pay out of the employment funds all or any of the expenses incidental to the provision of his instruction. If that was construed, as it was anticipated to be construed, in its relation to the public health, the test and instruction of the plumber would call for the consideration of the General Council of the National Registration of Plumbers.

A notable confirmatory view was expressed in Scotland on Monday, when Sir James Crichton-Browne, in presenting prizes to the successful students in the plumbers' classes at Dumfries, said: "It is the laudable aim of the Plumbers' Company at the present day, as in the past, to prevent bad and defective plumbing, and in their enterprise we must all heartily wish them God-speed. An Englishman's or a Scotchman's house isn't his castle if it is riddled with secret passages through which the legions of disease may pour in upon him. Innumerable lives have been lost by bad plumbing and draining work. Let us put a final stop to that, and insist that all new men who have been qualified by long experience shall have diplomas of fitness. The man who holds a diploma becomes something more than an artisan. He is really an artist, takes a pride in his calling, and tries to place it on a higher footing."

GLASGOW BUILDING TRADE.

At a recent sitting of Glasgow Dean of Guild Court Mr. Francis Henderson, the retiring Dean of Guild, made the customary annual statement. The general trade of the country had, he said, recently been experiencing better times. But the wave of prosperity had not yet reached those trades with the work of which a Dean of Guild Court was more intimately concerned. The building trades of Glasgow were still far from the enviable position which they occupied some years ago. That might be due to many things. It might be that in those years there was to some extent over-building. But if ordinary conditions had prevailed they would have heard less of this cry of over-building. Ordinary conditions had not prevailed. He found from the report on the census of 1911 by the City Medical Officer of Health that whereas the natural increase of population—that was, the excess of births over deaths—for the decade ending in 1911 was 91,202, the actual increase was only 8,902. In other words, instead of a percentage of 11.8, the actual increase showed only a percentage of 1.1. The loss to the city by emigration and by overflow into suburban areas was rather apt to be forgotten by unsympathetic critics of builders. Be that as it may, however, the building trades during the past year had had nothing to boast of, which, no doubt, was to some extent owing to the fact that there were still within the old city boundaries 18,620 unoccupied houses and 4,620 unoccupied shops, &c. The returns for houses generally, for warehouses, shops and offices, for churches and halls, for

schools and for public buildings, all showed marked decreases in value. There had been a very great and, to his mind, satisfactory decrease in the number of houses consisting of one apartment. The returns for houses of three and four apartments and for single shops and workshops, &c., showed slight increases. But the past year was seen at its best in the returns for alterations and additions. Though the number of cases for these was much the same as in the previous year, the valuation of the work involved had risen from £105,885 to £169,213.

The statistics for the year he was dealing with were as follows:—For warehouses, shops and offices, there were forty linings, six being for new work and thirty-four for additions and alterations. The valuation of the new work was £84,631 and the valuation of the additions and alterations £27,007. For workshops, manufactories, stores, stables, sheds, &c., there were 140 linings, seventy-one being for new work and sixty-nine for additions and alterations. The valuation of the new work was £112,308 and the valuation of the additions and alterations was £59,704. For churches and halls there were six linings, equally divided between new work and alterations and additions. The valuation of the new work was £8,764, and the valuation of the additions and alterations was £220. For schools there were ten linings, three being for new work and seven for additions and alterations. The valuation of the new work was £22,985, and the valuation of the additions and alterations was £6,461. For public buildings there were forty-two linings, eighteen being for new work and twenty-four for additions and alterations. The valuation of the new work was £127,602, and the valuation of the additions and alterations was £65,826. For new streets there were only three linings, the length authorised being only 249 lineal yards—the lowest record during the past twenty-eight years. For houses and shops there were seventy-eight linings, fourteen being for new work and sixty-four for additions and alterations. The valuation of the new work was £51,139, and the valuation of the additions and alterations was £9,875. Of the eight districts into which the city was divided, Queen's Park again took the lead with twenty-seven linings, Maryhill coming second with seventeen, and the Central coming last with none. During the year six houses of one apartment, 120 of two apartments, fifty-three of three apartments, thirteen of four apartments, six of five apartments, and two with six or more apartments were authorised. Single shops to the number of twenty-five and double shops to the number of six were also authorised. The total valuation of new houses and shops amounted only to £51,139. In respect of houses and shops they had reached the lowest point in the forty years for which they had statistics.

He noticed in the report he had already referred to that the average house in Glasgow contained 2.550 rooms, that the average number of occupants in each house was 4.658, and the average number of persons per room was 1.827. The average number of rooms per house had come down a little from the corresponding figure of ten years ago. But in judging of sanitary conditions the density per room was the better guide. The figures given as to the average number of persons per room was still higher than what one would like to see, but in comparison with the figures of twenty and thirty years ago they showed a very marked improvement. Apart from that, sanitary and other conveniences had made great strides. The percentage of unlet rental was on the increase. In 1902 it was only 2.29 of the total rental. In 1907 it had risen to 5.35, and this year it had reached the high figure of 6.34. Over and above the cases spoken of, the Court had last year disposed of fifty-four cases at the instance of the Procurator-Fiscal or the Master of Works. In these cases 373 proprietors were concerned. The cases which dealt with the repair of roads and pavements involved an expenditure of £6,150, and those dealing with sewers an expenditure of £685. Together these sums amounted to £6,835, as against £4,902 in the previous year. In three cases fines were imposed for Guild offences.

The visitations by the Court during the year had been in connection not only with controversies between neighbours, but to a great extent with the exercise of statutory powers and particularly with what were known as hollow squares. These statutory powers were no doubt complicated and vested in the Court a large discretion, but in the discussion of this matter the special constitution of the Court seemed not to be always known or kept in view. It would be difficult to imagine any body better fitted to exercise a wise discretion or to hold the balance equally between the municipality on the one hand and the citizens on the other than a Court constituted as that one was. In his opinion, says the

Glasgow Herald, it was as nearly as it was possible for human ingenuity to devise a perfect instrument for the carrying out of the purposes for which it was originally established, and where the interests and welfare of the inhabitants of Glasgow were concerned no Court in the United Kingdom had a clearer vision. He referred a year ago to some alterations and improvements in the procedure of the Court which had been instituted for the facilitating of their business. Further steps in the same direction had been taken this year, and the regulations of the Court were now so systematised that there should be very little possibility of difficulty or misunderstanding arising in future.

REBUILDING OF HANKOW.

In his trade report for the year 1911, an abstract of which appears in the *Board of Trade Journal*, the Commissioner of Maritime Customs at Hankow states that, as a result of the revolution in China, the once rich and prosperous native city of Hankow is a heap of charred ruins—an area of two square miles, formerly occupied by a network of streets full of fine shops and teeming go-downs, having been utterly destroyed. To attempt to assess the damage would be futile—100 million taels or 500 million taels might equally be near the mark. The blotting out of the city has been the cause of untold misery to thousands of its former inhabitants; but the cloud is not without some silver lining. The city consisted of a congested mass of buildings of all sizes, with the usual narrow lanes and insanitary conditions, and only its destruction would ever have made possible the city on modern lines, which is absolutely required for the proper development of the port. Much raising of the land behind will be necessary before the new city can be built, but plans are being drawn up to utilise the old site with a view to future extension. With local desolation and general disturbance, it is hard to prophesy when Hankow will recover. An old experienced Chinese merchant holds that not less than thirty years will be required; the writer, with eight years' experience of its growth under great difficulties, expects that the third year of a settled government will see its trade greater than ever. Immense sums will have to be spent on the new city, but it is only reasonable to suppose that China as a whole will come to the aid of the place which has been destroyed in establishing the Republic. The local leaders have shown wisdom throughout, and may be expected to re-build the city properly. The old site is too small: the new city should be planned with a view to using the triangle between the railway and the rivers entirely for business purposes, and driving both the residential and poor quarters to the other side of the railway.

An excellent thing for Wuhan would be an electric tube under the river, the power plant also lighting Wuchang and driving trackless cars; it appears to offer few difficulties, and a double line would cost under £1,000,000, perhaps only £700,000. It would provide the needed means of communication both for the present and when the Canton Railway reaches Wuhan, and would relieve the congestion at Hankow by the waste hills and lands on the Wuchang bank of the river being taken into residential occupation, the enhanced price for which the Government could sell such land going far to pay the cost of laying the line. Such a tube would be far more effective than the constantly mooted bridge, which a competent foreign engineer has estimated to cost £6,000,000, apart from cost of land approaches, and which would cost a large sum for upkeep.

MR. THOMAS ARNOLD, architect, F.R.I.B.A., of 22 Brougham Street, Edinburgh, who died on July 12 last, left personal estate in the United Kingdom valued at £4,356, of which £2,015 is in Scotland.

MESSRS. MACMILLAN & Co. will publish shortly "Byzantine Churches in Constantinople, their History and Architecture," by Dr. Alexander Van Millingen, Professor of History, Robert College, Constantinople; with the assistance of Mr. Ramsay Traquair, A.R.I.B.A.; Mr. W. S. George, F.S.A.; and Mr. A. E. Henderson, F.S.A. The book constitutes a fresh study, undertaken with the object of confirming what is true, correcting mistakes, and gathering additional information. *Sta Sophia* is not dealt with, partly because there were many obstacles in the way of a proper treatment of it, and partly because earlier writers had made the attempt seem superfluous. The book has 92 page plates and 132 plans and illustrations in the text.

STAINED-GLASS DOOR PANELS, DESIGNED BY CLAIRE GAUDET, AND EXECUTED BY MESSRS. E. & C. O'NEILL
Exhibited at the St. Louis and New Zealand Exhibitions and the Old Salon, Paris, 1912.

THE Brixham Urban District Council have adopted a scheme of further extending the breakwater at a cost of over £40,000. The plans have been prepared by Sir John Wolfe Barry & Partners, Westminster. Messrs. W. Hill & Co., of Victoria Street, Westminster, who carried out the recently completed extension, have been awarded the contract without competition.

MR. FRANK MATCHAM is preparing a scheme of extensive alterations to be carried out to the hotel on Tagg's Island, near Hampton Court.

MR. E. S. PRIOR, M.A., F.R.I.B.A., Slade Professor of Fine Art, has been elected into an Honorary Fellowship at Gonville and Caius College, Cambridge, of which college he was formerly scholar.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

BUCKINGHAMSHIRE.

Terriers.—Church Room.

CHESHIRE.

Bredbury.—Two houses, Mill Lane, for Messrs. E. & H. Bridge.

Warehouse extension, Chadkirk, for Messrs. Sydal Brothers.

Works extension, Britannia Works, Redhouse Lane, for Messrs. Pollock & Macnab.

CUMBERLAND.

Newtown.—Junior Council School (£6,000).

Penrith.—Council School.

Talkin.—"Blacksmiths' Arms" Inn: additions and alterations. Mr. J. Leslie (of Carlisle), architect.

DERBYSHIRE.

Matlock.—U.M. Church Schools (£500).

DEVON.

South Molton.—Artisans' dwellings (£1,800).

DORSET.

Winterborne Abbas.—Pair of cottages on the "Poor Lot" site.

DURHAM.

Boldon.—Twelve (or more) homes for aged miners, Hedworth Road. Mr. J. H. Morton, F.R.I.B.A. (of South Shields), architect.

Chopwell.—Workmen's dwellings (£5,300).

Hartlepool.—Drill Hall and Headquarters for the Boys' Brigade (£3,000).

South Shields.—Thirty (or more) homes for aged miners. Mr. J. H. Morton, architect. (See above, "Boldon.")

Usworth.—Fifty-seven working-men's houses (£12,800).

GLOUCESTERSHIRE.

Bristol.—Council School for 500 places, Baptist Mills.

HAMPSHIRE.

Bournemouth.—Savoy Hotel additions, West Cliff, for Mr. W. L. Taylor.

"Merivale Hall," Meyrick Road: additions for the Imperial and Grand Hotels Co., Ltd.

No. 19 Ashley Road: additions for Mr. D. L. Ballard. House and stables, Branksome Hill Road, for Mr. A. Frewin.

House, Castlemain and Paisley Roads corner, for Mr. H. C. Coates.

"Tenanova," Milner Road: additions for Mr. C. S. McKay.

"Castle" Laundry, Castle Road: additions for Mr. R. Bevington.

Lock-up shop, No. 30 Commercial Road, for Messrs. Usher's Brewery Co.

Southampton.—St. Mary's Church tower (£4,500).

KENT.

Ashford.—Kiln, Dover Place, for Messrs. Eastes & Loud.

Gillingham.—Bungalow, Bredhurst Road, Wigmore, for Mr. E. M. Morris.

Bungalow, Hempstead, for Mr. E. French.

House, Eva and Ivy Roads corner, for Mr. Fairbrass.

House, Gillingham Road, for Mr. Carrington.

House, Napier Road. Mr. E. J. Hammond, architect.

House, Wigmore Road, for Mr. E. Towers.

Gravesend.—House, Parrock Road. Messrs. Bridgland & Clay, A.R.I.B.A., architects.

Sevenoaks.—House, Solefields.

Building additions for the Anglo-American Oil Co., Goods Station Yard, Tubs Hill.

Tunbridge Wells.—Ice factory, Vale Road, for the Tunbridge Wells Ice and Cold Storage Co., Ltd.

Church Army premises, Upper Grosvenor Road: additions.

St. Mark's Church Hall, Bayham Road.

Two houses, Culverden Down, for Mr. A. E. Avon.

"Bellevue," Forest Road: additions for Mr. A. Badcock.

House, Forest Road, for Mr. F. Bell.

Sixteen houses, Lime Hill Road, for the Tunbridge Wells Ice and Cold Storage Co., Ltd.

"Yewbank": additions for General Suart.

House, Oakdale Road, for Mr. E. Winchester.

Five houses, St. John's Road, for Mr. L. Ide.

Five pairs of houses, Whitefield Road, for Mr. A. E. Avon.

Avon.

LANCASHIRE.

Blackburn.—St. Michael's Parish Hall.

Bolton.—Bungalow, Lower Heys, Doffcocker, for Mr. Hampson.

Mill extension, Gilnow Lane, for Messrs. Salmon & Taylor.

Halliwell Mills extension, off Weymouth Street, for Messrs. Greenhalgh & Shaw, Ltd.

Works additions, Markland Hill, for the Ferrorock Stone Co., Ltd.

Works additions, Gibraltar Street, for Messrs. J. Deorden & Co.

Liverpool.—Cathedral transept (£79,000). Mr. G. G. Scott, F.R.I.B.A. (of London), architect.

Ulverston.—Coronation Memorial Hall (£3,000).

LINCOLNSHIRE.

Lincoln.—St. Peter-in-Eastgate: church improvements (£1,800).

House, Church Lane, for Mr. P. W. Robson.

Thirteen houses, Burton Road, for Mr. J. H. Harrison.

House, Monks' Road, for Mr. R. L. Holland.

Fifteen houses, Dorset Street, for Messrs. Oldfield & Hayes.

Four houses, Scorer Street, for Lincoln Land and Building Society.

House and shop, No. 260 High Street: alterations for Mr. J. Buttery.

Two houses and stabling, Olive Street, for Mr. W. F. Berry.

MIDDLESEX.

Hampton.—Cottage Hospital, Upper Sunbury Road. Mr. F. G. Hughes, architect.

NORFOLK.

Great Yarmouth.—Additions to premises, Riverside, Gorleston, for the Royal National Mission to Deep Sea Fishermen.

NORTHAMPTONSHIRE.

Corby.—Council School (£4,750).

Crick.—Council School.

Irthlingborough.—Baptist Schools, Meeting Lane.

Kettering.—Factory additions, Carrington Street, for Messrs. Mobbs & Lewis, Ltd.

Workhouse, London Road: Men's day room.

Towcester.—Council School (£3,000).

SOMERSET.

East Compton.—Public Elementary School.

STAFFORDSHIRE.

Audley.—Bradwell Joint Hospital (£5,000).

Hanley.—Baptist Church (500 sittings) and Schools (400 places), Old Hall Street.

Bushbury Lane, Fazeley, and Halmer End.—Council Schools.

Newcastle.—Seven cottages, Stanier Street. Borough surveyor.

Cinema Theatre, High Street: completion for Messrs. Coop & Co.

Rushall.—Infants' school (for 228 places) and drill hall.

Stafford.—Parish vestry and diocesan library, St. Mary's Churchyard.

Stoke.—Northcote Memorial Catholic Day School for boys (£4,000).

SURREY.

Dorking.—St. Martin's Church: Chancel aisle. Mr. B. Champneys, F.R.I.B.A., architect. Messrs. Bunning & Fitton Adams (of Godalming), contractors (£1,215).

Epsom.—Police Court (£3,500).

Woking.—Working-men's cottages.

WORCESTERSHIRE.

Dudley.—Mission Church.

YORKSHIRE.

Alne.—Wesleyan Church: Schoolroom, Vestry, &c. Mr. J. F. Todd (of Easingwold), architect.

Bridlington.—Workmen's dwellings for twenty-five families.

Pickering.—Conservative Club: alterations.

Sheffield.—Coroner's Court and Mortuary, in Nursery Street, Wicker and Nursery Lanes (£5,000).

WALES.

Garnant.—Council School (£6,800).

Llanelly.—Public Hall.

Fifty municipal houses.

Neath.—Joint hospital for thirty beds (£11,400).

Swansea.—St. Jude's Church: extension.

St. Joseph's R.C. School: alterations. Mr. G. E. T. Laurence, A.R.I.B.A. (of London), architect.

SCOTLAND.

Ayr.—Y.M.C.A. rooms, High Street (£5,000).
Chryston.—Four tradesmen's houses, Epileptic Colony, East Muckroft. Glasgow Parish Council.
Dunbar.—Cavalry barracks, Castle Park.
Edinburgh.—Y.M.C.A. buildings (£50,000).
Greenock.—Governor House, Battery Park, for the Corporation Gas Department.
Tenement, Belleville Street, for Messrs. R. Aitkenhead & Sons.
Board School.
Lowvalleyfield.—Ten workmen's dwelling-houses.
Millerston.—Double cottage, Mossbank Industrial School, for Glasgow Juvenile Delinquency Board.
Perth.—Postal Sorting Office, St. Andrew Street.
Portobello.—Town Hall. Mr. J. A. Williamson, A.R.I.B.A. (City Superintendent), architect. Accommodation for 1,000 sittings (£6,000).
Wick.—Lifeboat house (£1,100).

IRELAND.

Killiney.—Working-class houses (£1,800).

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 5,818. March 8, 1912.—Distributing tank for use in systems of heating by liquid circulation. A. R. Poole, 9 Langholm Crescent, Darlington. This invention has reference to an improved system of circulating heated water, the object being to enable pipes and radiators to be warmed or heated when installed below the level of the boiler, without the assistance of steam, pumps, injectors, or other mechanical power, thus enabling the boiler to be placed at any level. Fig. 2 is an elevation of distributing tank showing the various pipes for supplying and distributing or circulating the water. The distributing tank is fitted with the usual supply pipe a^1 for cold water, which is connected to the usual cold water storage tank (not shown), the latter

being fitted with automatic controlling valve and overflow. A back pressure valve may be fitted in cold water supply pipe, a^1 , to prevent the return flow of water from the tank to the cold water storage tank. The distributing tank is sealed or entirely covered, and passing to this tank direct from the boiler is a pipe, a^2 , for conveying the hot water. The pipe, a^2 , which extends up into the tank above the water level, has a continuous opening or openings, extending from just below water level, B^1 , before water is heated to and above a point equal to water level, B^2 , when water is heated and expanded. The end of pipe a^2 above water line B^2 is left open. The hot water is conveyed from tank through the outlets a^3 , of which there may be one or more. The tank is fitted with the usual vent pipe, also manhole for inspection. A gauge glass may be fitted to the tank to show level of water. When the water in the boiler is heated it flows up pipe a^2 into the tank through openings in pipe a^2 . When circulation starts, the water passes through the restricted portion of opening or openings in pipe a^2 , at and slightly below water level B^1 , and as the whole of the water in the apparatus becomes heated and circulated it expands and

risers to water level B^2 in the tank, and discharges through the opening or openings in pipe a^2 of increasing area. The water in the tank circulates through the outlets a^3 throughout the system and finally back to the boiler, and so on continually. By this means it will be seen that a constant circulation is maintained between the distributing tank and the boiler as it passes throughout the entire system, thus enabling pipes, radiators or the like to be warmed either when situated above or below the boiler. August 21, 1912.

PATENT SPECIFICATIONS PUBLISHED
OCTOBER 10, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 24,764. Nov. 7, 1911.—E. W. Brown, 17 High Street, Colne, Wiltshire, and C. J. Watts, Westbury, Banister Road, Southampton. Combined screen and stove or radiator.

27,232. Dec. 5, 1911.—Daniel Murphy, 52 Ashburnham Road, Greenwich, S.E. Bolts for doors, gates and the like.

27,754. Dec. 11, 1911.—John Shanks, Tubal Works, Barrhead, Renfrewshire. Supply connections for cisterns of an installation of water closets and the like.

27,858. Dec. 12, 1911.—G. Andina, Trofarello, and J. W. Bottomley, Whitehouse Engineering Works, Leeds. Kilns for burning or firing bricks, tiles or other earthenware, fireclay or like goods.

28,040. Dec. 13, 1911.—William C. Stephens, Climax Drill Works, Carn Brae, Cornwall. Unions for couplings for cocks.

909. Jan. 11, 1912.—Joseph Schwend, 13 Moller Strasse, Strassburg i E. Chimney pots.

1,358. Jan. 17, 1912.—A. G. Watkins and C. A. Llemm, Harrisburg, Dauphine, Penn., U.S. Methods of reinforcing wood.

1,711. Jan. 22, 1912.—Ellen Chandler and Emily Corin, 2A The Boulevard, High Road, Balham, S.W. Sinks.

2,251. Dec. 8, 1911.—T. Boyd, 289 Featherstall Road, North, Oldham. Attachments for glazing bars.

2,786. Feb. 3, 1912.—Richard Ames, 145 Ditchling Road, Brighton. Pipe joint.

8,832. Feb. 3, 1912.—Richard Ames, 145 Ditchling Road, Brighton. Flexible joint for spigot and socket pipes.

4,318. Feb. 21, 1912.—E. M. Knight, 11 Southampton Buildings, W.C. Filters.

5,507. March 5, 1912.—Hall & Kay, Ltd., D. Hall, and J. H. Kay, Stockport Road, Ashton-under-Lyne. Means for uniting the ends of sheet metal tubes.

10,709. May 6, 1912.—John Carlson, 1295 Gay Street, Portland, Oregon, U.S. Mortising machine.

10,788. May 7, 1912.—L. Mitchell, Town Hall, Bolton, and G. T. Hamer, 69 Morningson Road, Bolton. Pipe couplings.

13,479. June 8, 1912.—John Caldwell, 48 East Eighty-Ninth Street, New York. Door locks.

20,652. Sept. 18, 1911.—Martin Hatz, Bauspengerei-u-Installations-geschäft, Chur, Switzerland. Metal roofing sheets.

20,731. Sept. 19, 1911.—Florenca Escalada, the Waldorf Hotel, Aldwych, London. House for tropical climates.

20,749. Sept. 19, 1911.—Ogleslav Kosstovitch, Malaya Rybatzkava, Sloboda 150, St. Petersburg. Manufacture of composite boards, slabs and plates of wood.

20,886. Sept. 21, 1911.—Samuel Abram, North Lodge, Mytton Road, Whalley. Brick and like moulding machines.

21,107. Sept. 25, 1911.—Tom Smith, Uxbridge Engineering Works, Uxbridge Street, Burton-on-Trent, and A. H. O'Brien, 3 Duffield Street, Leicester. Apparatus for heating air and water.

21,162. Sept. 25, 1911.—C. H. Waithman, A.M.I.C.E., Durham House, All Saints Road, Newmarket. Windows.

23,258.—Oct. 21, 1911.—C. H. Hubbard, The Oaks, Prenton Road West, Birkenhead. Fastening or securing means for doors, gates, cupboards or the like.

24,391. Nov. 2, 1911.—Alex. Siewert, Kaiser Wilhelmstr. 6, Lankwitz. Metal beams.

27,539. Dec. 8, 1911.—Thomas Boyd, 289 Featherstall North Road, Oldham. Glazing bars.

28,948. Dec. 22, 1911.—A. D. Mosby, 7113 Normal Avenue, Chicago, Illinois, and H. M. Capron, Ridge Avenue, Winnetka, Illinois, U.S.A. Concrete mixer drums.

279. Jan. 3, 1912.—Solomon Barnes, 189 St. James Street, Montreal. Sand hoppers for moulding machines.

1,589. Jan. 19, 1912.—W. H. Whitmill, Cliftonville, Coniston Road, Earlsdon, Coventry. Means for forcing air into water supply and like systems.

2,252. Dec. 8, 1911.—Thomas Boyd, 289 Featherstall Road North, Oldham. A bar for collecting condensed water from windows or the like.

6,156. March 12, 1912.—Date claimed under International Convention Oct. 11, 1911. Mrs. W. Frank, 148 Krefeldstr., Dusseldorf-Heerd, Germany. Plaster-carrying device for ceilings, walls and the like.

6,684. March 18, 1912.—Date claimed under International Convention March 16, 1911. Armand Avril, 68bis rue du Poteau, Paris, architect. Means for securing metal balusters to the springboards or supports of staircases.

9,833. April 25, 1912.—Hector Verschaffel, rue de l'Harmonie, Haine St. Pierre, Belgium. Means of separating the water from the slurry in the manufacture of Portland cement.

11,066. May 9, 1912.—W. M. Venable, 1204 Westinghouse Buildings, Pittsburgh. Moulds for casting columns *in situ*.

OSRAM WEEK.

NEARLY a year ago the General Electric Co. inaugurated the Osram week campaign, manufacturer, wholesaler, and dealer combining to direct the attention of the public to the most up-to-date methods of electric lighting. In connection with this movement most of the leading electrical contractors, stores, and ironmongers are again holding an exhibition of lighting in their establishments and displaying in their shop windows Osram lamps of various candle powers and voltages, with various other up-to-date electric lighting appliances of every description. When the lamp was introduced it at once effected a saving in current of 75 per cent. compared with the then universally used carbon lamps. It also gave a considerably better light. The most recent addition to the better lighting epoch has been the introduction of a new filament into the Osram lamp. This lamp is now made with a filament of pure drawn tungsten wire, wound in one continuous jointless length.

VARIETIES.

MR. B. T. BATSFORD will shortly publish "A Short Critical History of Architecture," by Mr. H. H. Statham, F.R.I.B.A.

THE Epsom Urban Council has decided to expend £6,194 on a scheme for increasing the sewer capacity in the town so as to prevent flooding.

THE Water Committee of the Tynemouth Town Council has decided upon the provision of a special filtration plant in connection with the borough's water undertaking, to remove the dark stain of the peat and heather from the water. The scheme will cost about £11,500.

THE Gloucester Corporation have recently purchased by auction for £3,500 the building in Southgate Street, near the Cross, known as "The Old Blue Shop and City Tea Warehouse," one of the city's historic houses. The elaborately carved façade of the building is one of the "sights" of Gloucester. The present building is about 260 years old, and has been continuously used since 1746 as a grocery.

It is with sincere regret we record the death of Mr. Vaughan Pendred, for so many years the Editor of our contemporary *The Engineer*. Mr. Pendred became Editor of *The Engineer* in 1865, and retired in 1905 through ill-health, when his son, the present Editor, succeeded him. A man of unflinching courtesy, fine presence, and a scholarly writer, Vaughan Pendred was a man who inspired respect and esteem, and his loss will be felt by many friends in the professions, both of engineering and journalism.

THE committee of the British Constitution Association at a meeting held at its offices, 11 Tothill Street, on the 4th inst., unanimously passed the following resolution:—"That this committee, acting in the interests of individual liberty and personal responsibility, cordially welcomes the recent circular of the Local Government Board in favour of securing the more flexible application of building by-laws in rural areas, and engages itself to do its best to influence the sanitary authorities to give the subject their most careful attention."

THE Royal Institute of the Architects of Ireland held a Council meeting at 31 South Frederick Street, Dublin, last week. The President (Mr. A. E. Murray, R.H.A., F.R.I.B.A.) was in the chair. A large amount of correspondence was dealt with, including letters from the Not-

tingham Architectural Society, the Master Builders' Association, the Surveyors' Institute re Insurance Act. Several names in connection with the election of Hon. Secretary and Hon. Treasurer were considered by Council.

THE Newbold and Whittington Urban Council have been informed that plans and estimates are almost ready for the new sewage disposal works, costing over £7,000.

MESSRS. GEORGE NEWNES, LTD., announce two forthcoming books in their "Country Life" Library. The first is "Gardens for Small Country Houses," by Gertrude Jekyll and Lawrence Weaver, and will be published at 15s. net. The other is a new volume of "English Homes," edited by Mr. H. Avray Tipping, M.A., F.S.A. (42s. net). This will consist entirely of homes of the Early Renaissance period, and show the internal character, furniture, and adornments of notable Elizabethan and Jacobean houses with their gardens.

THE Plans and Works Committee of Edinburgh Town Council last week discussed a letter from the secretary of the Edinburgh, Leith and District Building Trades' Association regarding the fair wages clause in city contracts, and protesting against "the inquisitorial interference in the conduct of their business." In the course of their letter, the Association suggested the rescinding of the resolution regarding the supplementary clauses, and urged the reversion to the old clause in connection with the contracts. This latter clause provides for the payment of "the standard rate of wages or such wages as are generally accepted as fair in the trade," while in the supplementary clauses it is provided that during the three months prior to the date of a tender the contractor must have paid his workpeople not less than the standard rate of wages, and that "in the event of this fair wages clause being broken in any particular, the contractor shall be bound to refund to his workpeople the difference between the amount paid to them and the standard rate of wages, and the Town Council shall be entitled to deduct the amount of the accountant's fee and any other expenses caused through a breach of this contract." The matter was remitted to a sub-committee for consideration and report.

TRADE NOTES.

MR. F. J. BARNES, proprietor of the Portland Stone Quarries, Portland, Dorset, has been honoured with the order for the whole of the Portland stone required for refacing Buckingham Palace. Sir Aston Webb, C.B., R.A., is the architect.

THE bells of Marston Biggott, near Frome, Somerset, are to be retuned and rehung in a new steel frame, complete with the most modern fittings. The work of restoration has been entrusted to Messrs. John Warner & Sons, Ltd., of the Spitalfields Foundry, London. Messrs. John Warner & Sons have in hand a new bell weighing 7½ cwt., note C, for the church of Our Lady of Ransom, Eastbourne.

A LARGE clock has been erected in Maulden Church Tower, Bedfordshire, which shows time on one large dial, plays the Westminster quarter chimes and strikes the hours. The work has been carried out by John Smith & Sons, Midland Clock Works, Derby, who recently erected a similar clock at Silsoe Church, in the same neighbourhood.

MESSRS. GEORGE MILLS & CO., LTD., Radcliffe, Manchester, have received instructions to protect with the "Titan" patent automatic sprinkler the new design of cotton safes that are being erected for the Trafford Park Estates, Manchester, to store 50,000 bales of cotton.

LINDSAY'S PADDINGTON IRONWORKS, LTD., is the name under which in future the old-established business of Lindsay, Neal & Co. will be carried on. Thorough reorganisation of the works has been effected on modern lines, and new plant has been laid down, ensuring prompt delivery of work entrusted to them. The telegraphic address, "Troughing," London, and the telephone number, 74 Paddington, remain as before.

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Failsworth, Manchester, have supplied some of their warm-air ventilating patent Manchester grates to Llanryre Hall, Llandrindod Wells, and to the Milford Haven Catholic Schools; the Eastleigh and Bishopstoke Isolation Hospital is being supplied with Shorland's exhaust roof ventilators; the extensions to the Grammar School, Brigg, are being fitted with their Manchester grates, patent exhaust roof and special inlet ventilators; and the Spittlesea Hospital, Luton, is being supplied with Shorland's warm-air ventilating Manchester stoves, with descending smoke flues and exhaust roof ventilators.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie—Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CANADA.—Nov. 1.—The Government of the Dominion of Canada invite from artists who are British subjects competitive designs (in the form of plaster sketch models) for a monument to be erected at Ottawa, to His Late Majesty King Edward VII. The total cost of the monument must not be more than 35,000 dollars. The author of the best design will be awarded the commission of the work, and the second best will receive a prize of 1,000 dollars. All communications must be addressed to The Secretary, Public Works Department, Ottawa, Canada.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

GLASGOW.—Oct. 29.—The Glasgow Corporation invite architects to submit preliminary sketch designs, in competition, for an extension of the Municipal Buildings. The assessor appointed is Mr. John J. Burnet, LL.D., A.R.S.A. The conditions of competition, with full particulars of the accommodation required, and plans of the present buildings and of the site of the extension, can be obtained from the Town Clerk on payment of £1 1s., which will be refunded on receipt of a bona-fide design, or on the return of these documents within three weeks. From the sketches submitted the authors of not more than five designs will be selected to submit completed drawings in a final competition at a honorarium of 100 guineas each. Mr. J. Lindsay, town clerk, City Chambers, Glasgow.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HUDDERSFIELD.—Oct. 31.—The Housing and Town Planning Committee of the Corporation invite competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb. The following prizes are offered—namely, first prize, 100 guineas; second prize, 50 guineas; third prize, 25 guineas. Copies of the conditions and other particulars may be obtained on application to the Borough Engineer upon depositing £2 2s. The deposit will be returned on the receipt of bona-fide designs, together with all documents. Mr. K. F. Campbell, M.Inst.C.E., borough engineer, 1 Peel Street, Huddersfield.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

WALES.—Oct. 31.—The Llandudno Urban District Council invite designs for laying out land adjoining the Happy Valley, Llandudno, about 20 acres in extent. A ground plan of the site may be inspected at the office of the Surveyor to the Council, Town Hall, Llandudno. A premium of 50 guineas will be awarded to the author of the design which may be considered the most suitable. Printed particulars and conditions may be obtained from Mr. Alfred Conolly, clerk, Town Hall, Llandudno.

CONTRACTS OPEN.

ALBURY.—Nov. 6.—For building six cottages at Albury, Herts., for the Hadham Rural District Council. Mr. E. T. Watts, surveyor, London Road, Bishop's Stortford.

BARNSELY.—Oct. 31.—For the following works, for the Barnsley Town Council—viz.: (Contract No. 1) erection of wholesale shops off Midland Street, Barnsley; and (2) providing and fixing iron fenceings, hurdles, gates, and other works of paving, draining, &c., required in the conversion of a part of the present wholesale greengrocers' market into a cattle market in Midland Street. Mr. J. H. Taylor, M.I.C.E., borough surveyor, Manor House, Barnsley.

BARTLEY GREEN.—Nov. 18.—For erection of a Council School in Brook Lane, Woodgate, for the Birmingham Education Committee. (Messrs. Crouch, Butler & Savage, architects, 39 Newhall Street, Birmingham.) Send names and £2 deposit by Oct. 20 to the Finance Department, Education Offices, Council House, Birmingham.

BATH.—Nov. 4.—For the complete construction and erection of masonry retaining wall, stone balustrade, &c., in the Orange Grove, for the City Council. Deposit £2 2s. The City Surveyor's Office, Guildhall, Bath.

BOLTON.—Nov. 4.—For the cottage homes extensions and for the conversion of the Townley's House into a receiving home, for the Guardians. Deposit £5. Mr. J. Ward, architect, 24 Mawdsley Street, Bolton.

CHELTHENHAM.—Oct. 26.—For domestic science buildings at Gloucester Road and Naunton Park schools. Send names before Oct. 26 to Messrs. Chatters & Smithson, architects, 17 Regent Street, Cheltenham.

CLEETHORPES.—Nov. 11.—For erection of a bandstand at the end of Kingsway and two shelters in the bastions of the Parade. Mr. C. H. Waithman, A.M.I.C.E., engineer and surveyor, Council House, Cleethorpes, Lincs.

EXETER.—Nov. 7.—For additions and alterations to the Royal West of England Institution for the Deaf and Dumb. Mr. J. Jerman, F.R.I.B.A., architect, 1 Bedford Circus, Exeter.

GLEDHOLT.—Nov. 1.—For the various works required in erection of a detached house in Grasmere Road. Messrs. J. B. Abbey & Son, architects and surveyors, 34a New Street, Huddersfield.

EMSWORTH.—Oct. 30.—For the demolition of seven cottages at Emsworth, for the West Sussex County Council. Mr. H. W. Bowen, A.M.Inst.C.E., County surveyor, Horsa-ham.

GRAVESEND.—Nov. 6.—For erection of an additional building to the vagrant wards at the workhouse, for the Guardians of Gravesend and Milton Union. Mr. E. J. Bennett, A.R.I.B.A., architect, 191 Parrock Street, Gravesend.

HARROGATE.—Oct. 28.—For the respective trades of mason and bricklayer, carpenter and joiner, plasterer, painter, and furnisher in connection with alterations to the end wings of the Victoria Baths, for the Corporation. Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Harrogate.

HOLMFIRTH.—Oct. 29.—For the various works required in erection of a hippodrome in Eldon Yard. Mr. P. N. Brown, architect, Hawthorn Bank, Holmfirth.

IRELAND.—For completion of premises at Cushendall, for Mr. P. McAllister. Mr. J. A. Hanna, architect, Ocean Buildings, Belfast.

IRELAND.—Oct. 29.—For erection of a fisherman's shelter at the dockyard, near the stone bridge, for the Wicklow Harbour Commissioners. Mr. F. W. MacPhail, secretary, Town Hall, Wicklow.

IRELAND.—Oct. 31.—The Pembroke Urban District Council invite tenders for the erection of a pier, promenade, sea and other baths, and pavilion, and repairs to existing pier, and all works incident to and connected therewith, at Mer-rion, co. Dublin. Deposit £3 3s. Mr. J. C. Manly, clerk, Town Hall, Ballsbridge, Pembroke, co. Dublin.

IRELAND.—Nov. 1.—For erection of fifty artisans' and labourers' houses in two blocks of seven and two of eight each at Carrignafoy, and in four blocks of five each at Ballyvoloon, with necessary walls and fences, laying out grounds, and all other prescribed work, for the Queenstown Urban District Council. Deposit £2. (Mr. J. A. McCarthy, C.E., Timoleague.) Mr. J. H. Campbell, town clerk, Town Hall, Queenstown.

IRELAND.—Nov. 1.—For the erection of a new day room and a heating system at the sanatorium, Crooksling, Brittas, county Dublin, for the Dublin Joint Hospital Board. Deposit £1 1s. Mr. T. F. McNamara, C.E., architect, 192 Great Brunswick Street, Dublin.

IRELAND.—Nov. 4.—For erection and furnishing of National school buildings at Coolnoohill, Kilgarvan, co. Kerry. The Office of Public Works, Dublin, and Kilgarvan Royal Irish Constabulary Barrack.

IRELAND.—Nov. 8.—For erection and furnishing of National school buildings at Knockroe, Boyle, county Roscommon. The Office of Public Works, Dublin, and Royal Irish Constabulary Barracks, Boyle.

IRELAND.—Nov. 11.—For the erection of a masonry market house 100 feet by 40 feet at Ardara, county Donegal, for the Congested Districts Board. Mr. W. Chambers, Woodhill, Ardara, county Donegal.

LEEK.—Oct. 28.—For erection of a Council School to accommodate 454 children, for the Staffordshire Education Committee. Send applications and £1 1s. deposit to Mr. Graham Balfour, director of education, County Education Offices, Stafford.

LICHFIELD.—Nov. 15.—Tenders are required by the War Department for repairs and materials from Dec. 26, 1912, until March 30, 1914, at Lichfield. Send application by Oct. 31 to the Commanding Royal Engineer, R.E. Office, 13 Wenlock Terrace, York.

LONDON.—Nov. 1.—For erection of boundary wall, iron railings, and gateways at the Victoria Tower Gardens, London, S.W., for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. H. A. Collins, H.M. Office of Works, &c., Storey's Gate, S.W.

LONDON.—Nov. 6.—For demolishing 155 and 157 Peckham Rye, Peckham, S.E., for the Metropolitan Asylums Board. Deposit £1. Mr. W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, Office of the Board, Embankment, E.C.

LYMINGTON.—Oct. 30.—For alterations to the cells, the provision of a prisoner's w.c. and lavatory, together with other work, at Lymington police station, Hants. Deposit £2 2s. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

MAIDENHEAD.—Nov. 2.—For certain additions to the engine house buildings at their electric light station in Braywick Road, for the Town Council. Mr. P. Johns, borough surveyor, Guildhall, Maidenhead.

MANCHESTER.—Oct. 28.—For males' and females' conveniences at Phillips Park. Deposit 10s. 6d. The City Architect, Town Hall, Manchester.

NEWBRIDGE (MON.).—Nov. 1.—For the erection of ten pairs of semi-detached houses (more or less), for the Bryn Building Club. Messrs. Jenkins, James & Co., architects, Newbridge and Crumlin, Mon.

NORWICH.—Nov. 22.—For erection of a shelter at the cemetery in place of the one recently destroyed by fire, for the Burial Board. Mr. A. E. Collins, M.I.C.E., city engineer, Guildhall, Norwich.

PONTLLANFRAITH.—Oct. 28.—For erection of Council offices, caretaker's house, and outbuildings at Pontllanfraith, Mon., for the Mynyddislwyn Urban District Council. Mr. W. A. Griffiths, architect, Post Office Chambers, Pontllanfraith, Mon.

THE NEW WATERLOO STATION.

ENGLISH railway stations are not the cause of much national pride, for it is generally admitted that they do such things better abroad. There have been numerous contributory causes for this regrettable fact, one of them being a too great reliance placed upon the artistic ability of railway engineers. Another was their haphazard growth. Even in America this lack of foresight is apparent, and we find re-arrangement of the railways to be one of the leading features of plans prepared for the improvement of Washington and Chicago. Perhaps the most glaring instance of "how not to do it" which will occur to visitors to London is Waterloo Station. Commenced in 1848, this terminus was considerably enlarged in 1860 by a North station and again in 1878 by a South station. The result was extraordinarily confusing. About twelve years ago the London and South-Western Railway Company obtained Parliamentary powers to enlarge and improve their station. The huge work is not yet completed, and will probably involve an outlay of £2,000,000 at least.

It is worth while paying a visit to Waterloo just now in order to see the metamorphosis in actual progress, and so contrast the old with the new. A considerable amount of the old metal-framing still remains in position, enclosed like a doll's house under the fine new building. Architecturally, Waterloo is extremely interesting; its engineering aspect has clearly been allowed to dominate—as was perhaps inevitable. But the difficult problem has been courageously tackled, and the result reflects great credit on the Company's staff. In no respect is the improvement more striking than in the amount of daylight which now floods every platform. In the old days this station was of the most melancholy and gloomy description. All this has been changed, and it is now a veritable crystal palace. Of the construction of the ridge and furrow type of roof we need not speak. Glazing five bays of 120-foot span and one of 80 feet over successive railway platforms was no light task. The whole of this (as well as various screens) has been carried out by Messrs. W. E. Rendle & Co., Ltd., 5 Victoria Street, S.W., with their "Invincible" glazing. The firm have fixed millions of feet of glass roofing in many parts of the world. At Waterloo Station the area when completed will be 450,000 feet superficial. Another large and successful contract in London is Victoria Station, a third is at the Victoria and Albert Museum. The three chief points about their system is no painting, no putty, no leaking. The firm will be congratulated wholeheartedly by all who remember the old station and know the new.

THE Sheffield master builders have given the advance in wages from 9½d. to 10d. an hour asked for by the bricklayers. The increase will affect about 1,500 men, and will commence in October 1913.

MR. GEORGE TUNSTAL REDMAYNE, of Haslemere, Surrey, formerly in business in Newcastle as an architect, left estate of the gross value of £30,210 13s. 7d., of which the net personality has been sworn at £21,273 9s. 6d.

GLASGOW INSTITUTE OF ARCHITECTS.

THE quarterly general meeting of the Glasgow Institute of Architects was held last week in the secretary's chambers, 115 St. Vincent Street—Mr. John Watson, Lic.R.I.B.A., Vice-President, in the chair. Mr. C. J. MacLean, the Secretary, reported what the Council had done as to the following among other matters which had been dealt with since the last meeting:—(1) Housing and town planning conference; (2) Royal Institute requiring full affix to be used by licentiates; (3) several public competitions, the conditions of which have been found unsatisfactory, were barred by the Institute, but in some cases the conditions were amended; (4) deputation to Town Council regarding proposed carrying out of extension of Municipal Buildings by City Engineer, which had the effect of getting the Town Council to decide that competitive plans and designs be invited from outside architects for the erection of these buildings; (5) revision of rules for measurement and conditions of contracts; (6) report that Aberdeen Society was prepared to recommend a special rule as to architectural competitions on the lines recently adopted by the Glasgow Institute. The Glasgow Institute prize for the best set of measured drawings and sketches by pupils in the Royal Technical College has been awarded to Mr. A. G. Glen. The report of the Council was approved.

VARIETIES.

THE Rhyl Town Council have decided to invite qualified engineers to submit competitive schemes for repairing the pier at a cost of £10,000.

THE Pershore Rural Council have appointed Messrs. Dicks & Waldron, of Evesham, as architects for the proposed housing scheme at Pinvin. Plans are to be prepared for sixteen cottages costing £150 each.

THE Metropolitan Water Board on Friday last decided to provide new works in the Kent district at a total cost of £89,395, including a new well and pumping machinery at Shortlands to cost £30,000, and a new main between Addington Road and Lock's Bottom.

THE Tynemouth Town Council have accepted a scheme for the installation of a special filtration plant at an estimated capital expenditure of £12,650, to eliminate the brown stain from the water supplied from the Corporation's Font Waterworks.

THE Leeds City Council last week instructed the Parliamentary Committee to include in their next Bill powers for acquiring a site of six acres in South Accommodation Road for an electricity and refuse destructor station at a cost of £60,000. The proposed new electrical works are estimated to cost £595,000.

DETERMINATION to run no risks was wisely shown by an architect just recently when he specified that all the cement work required for a Carnegie Library about to be erected from his design should be treated with "Pudlo." It is essential that a library should be absolutely damp-proof—hence the wisdom of employing this powder for rendering the cement water-proof.

MESSRS. CLEMENT TALBOT, LTD., automobile engineers, Barby Road, W., have received by the last mail official intimation of a remarkable success in a petrol-consumption test held at Sydney by the Automobile Club of Australia. In this test a 12-h.p. Talbot was driven over the course of thirty miles on 2.3 pints of petrol. This is equivalent to no less than ninety-six miles to the gallon. Such an extraordinary performance will add still more interest to the Invincible Talbot Stand, No. 69, at the forthcoming Motor Show at Olympia, where representative cars will be exhibited.

THE premises of Messrs. Fowler & Brock, of King Street, South Shields, have recently been altered and enlarged at a total cost of £3,500. The buildings, with their floor space of 2,420 square yards, are now amongst the largest and most convenient in the district. Mr. Jas. Carruthers, of South Shields, was the general contractor, and the architect was Mr. H. Grieves, A.R.I.B.A., of Albany Chambers, South Shields.

THE Brompton Rural District Council have accepted the scheme of sewerage and sewage disposal for Castle Carrock prepared by the engineers Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.I.C.E.), of Newcastle and Birmingham. The sewage will gravitate to the outfall, and be disposed of in modern bacterial works. Application for the necessary loan is to be made at once to the Local Government Board.

THE North-East Lancashire building labourers, following the example of the local masons and wallers, have lodged a number of demands with the employers. The chief of these are: That the current rate of wages for builders' and bricklayers' labourers be 7d. per hour all the year round, with the exception of overtime; overtime to be paid at the following rates—time-and-a-quarter for the first two hours, time-and-a-half to midnight, double time on Sunday, Christmas Day, and Good Friday, time-and-a-half for work on general mill holidays; a labourer to carry not more than nine bricks at once up the ladder and not more than ten on the floor; no navy to be allowed to carry bricks on the floor; in cases of dispute five employers and five employees to act as a committee to settle the disputes, their decision to be final; the current rate for plasterers to be 8d. per hour; one man to labour for two plasterers all round, three for skimming and cornering.

THE Edinburgh Building Trades' Federation and the Electrical Contractors' Association recently protested against the terms of the Corporation fair wages clause in contracts. The complaints were considered by a sub-committee of the Plans and Works Committee of the Edinburgh Town Council last week. Objection was taken to the clause on the ground that it was inquisitorial and oppressive, as a contractor was held to have given assurance that for a period of three months prior to the contract he had paid the standard rate of wages, and the Corporation had power to examine the books of a contractor in event of a dispute arising as to the rate of wages paid. The sub-committee agreed to recommend that the Council adhere to the present form of the clause.

A SPECIAL meeting of the Council of the Royal Institute of the Architects of Ireland was held at the Institute Rooms, No. 31 South Frederick Street, Dublin, on Monday. In the absence of the President, the Vice-President (Mr. R. Caulfeild Orpen, B.A.) occupied the chair, and there were also present Messrs. G. P. Sheridan, J. H. Webb, H. Allberry, F. Batchelor, F. Hicks, C. H. Ashworth, L. O'Callaghan, W. Kaye-Parry, and C. A. Owen, Hon. Secretary. A considerable amount of correspondence was dealt with. The conditions governing the competition for the design of the new municipal offices for the Dublin Corporation were considered, and the Hon. Secretary was instructed to communicate with the City Treasurer about several points therein.

KING'S COLLEGE HOSPITAL FOR SALE.—In 1839 King's College Hospital was established on the west side of Carey Street, W., in a building which was formerly the district workhouse. The re-arrangement of the structure was carried out according to the plans of Sir Robert Smirke at a cost of £25,000. Ten years later these premises were supplanted by new and larger ones costing £50,000 from the designs of Mr. T. Bellamy. The hospital was then situated in one of the worst localities in London. During the past sixty years the neighbourhood has been transformed to such an extent that the hospital almost lost its *raison d'être*—the ministering to the surrounding poor. King's College Hospital has, therefore, been removed to crowded South London. The freehold site of the old hospital, over an acre in extent, and the existing buildings are offered for sale or to be let on a building lease, or alternatively an offer is invited for the retention of the existing buildings subject to alterations to meet modern needs. Tenders are to be given by December 18 this year to Messrs. Weatherall & Green, the hospital surveyors. Vacant possession will be given at the end of next year.

A NEW gas mantle has just been placed on the market which will undoubtedly create considerable interest among all users of gas appliances for lighting purposes by reason of the fact that it has been made flexible by a special process invented by Mr. J. I. Robin, from whom it derives its name—"The Robinlyte." The mantle is made of flexible threads, and may be knocked or folded without the slightest injury resulting. Users of the "Robinlyte" mantle are assured of a steady even light, and it is claimed that there is a saving of gas and increased lighting-power as compared with the ordinary mantle. The inventor also claims that the "Robinlyte" gives perfect combustion, obviating the hissing or roaring common with some mantles. The price compares very favourably with other makes, for it can be retailed at 3d., a price rendered possible by the simplicity of the manufacturing process also invented by Mr. Robin, and patented by him all over the world.

WEEK-END COTTAGES, BUNGALOWS, AND OTHER SMALL HOUSES.

DESIGN NO. 59.

A VARIED selection of designs differing both in treatment and cost is included in our Supplement this month, and the Editor will be pleased to introduce the authors to those who desire the services of the architect whose sketch, illustrated by us, shows the sort of house they require.

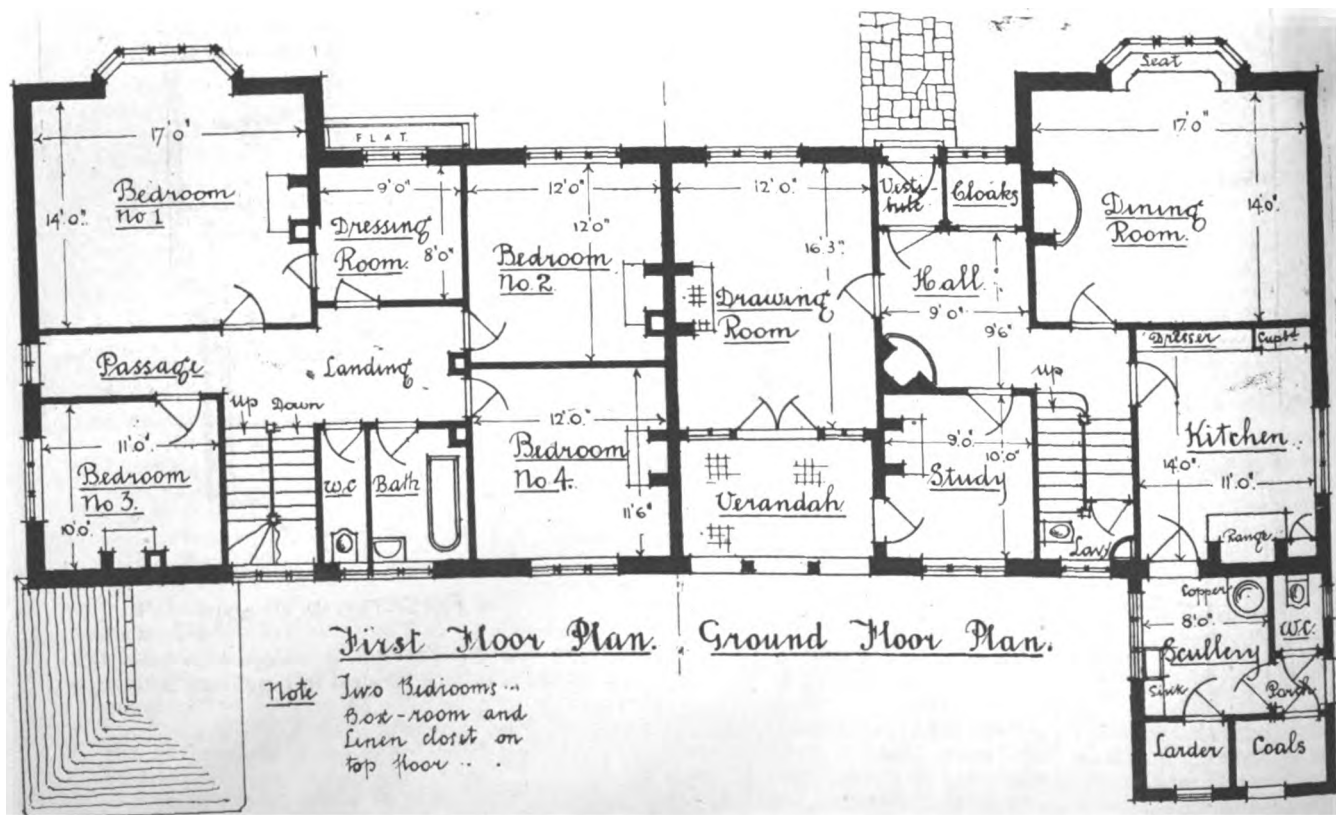

This little cottage with two sitting-rooms, three bedrooms and a dressing-room, is intended to be built with brick walls and tile roof, and would cost £575.

DESIGN NO. 60.

ENTRANCE FRONT.

Two semi-detached residences suitable for suburban dwellings form the subject of this design. The accommodation provided includes large dining-room with drawing-room, study, &c., on ground floor, whilst five bedrooms and a dressing-room are provided on the upper floors. The building is intended to be carried out in purple facing bricks to the lower part with rough-cast above and red square tiles as a roof covering. The doors and window frames would be painted green and the latter glazed with leaded glass. Together the two houses would cost approximately £2,000.

DESIGN NO. 61.

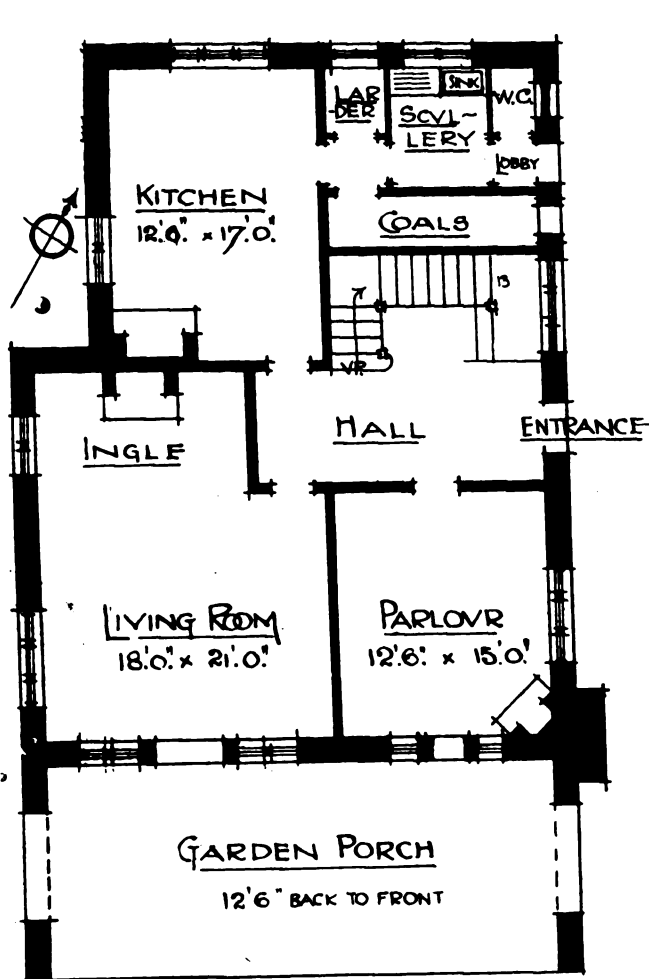

VIEW FROM GARDEN.

This house is intended for a week-end residence in a district where stone is the local material. A large garden porch is therefore provided which would be a pleasant sitting place for almost the whole of the year, as the arches in the wing walls could be shielded with curtains when necessary. The large living-room has an angle of sensible proportions, and both this room and the parlour have windows opening into the garden porch. The kitchen offices are compact and there are six very good bedrooms. The stone for which the house is designed is red Pennant or some similar stone, and the roofs would be covered with hand-made brindled tiles. The large gables would be finished in rough-cast as a relief to the stone and tile work.

The cost of erecting this house in a suitable locality would be about £1,000.

DESIGN NO. 61—continued.

DESIGN NO. 62.

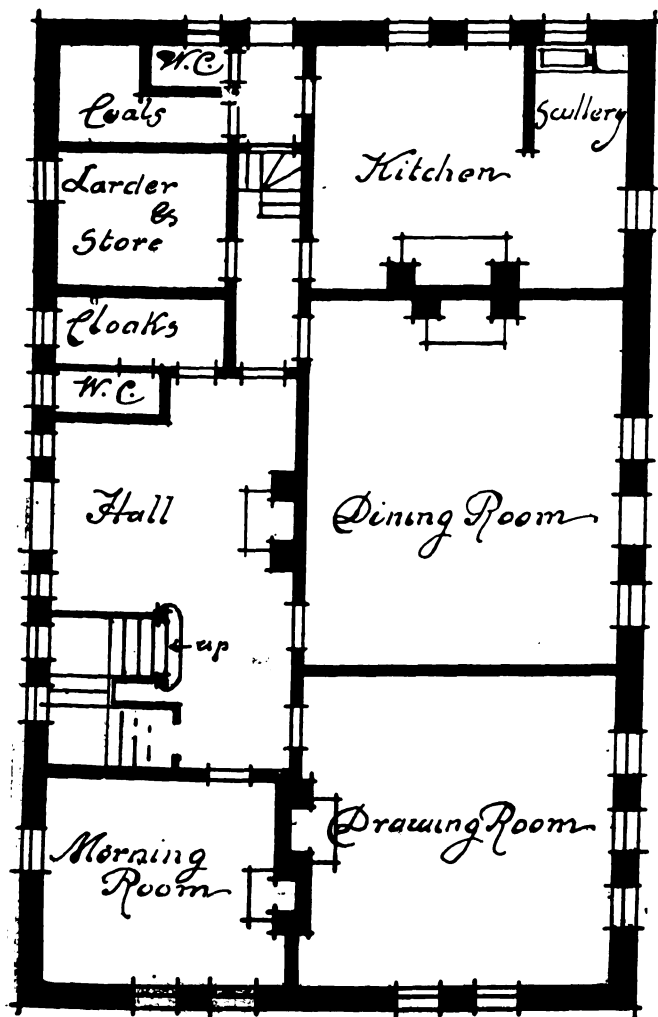

DESIGN NO. 62—continued.

FIRST FLOOR PLAN.

SECOND FLOOR PLAN.

GROUND FLOOR PLAN.

Here we have a square built house, which makes for economy both in first cost and in upkeep, whilst conveying the idea of substantial comfort, associated in our minds with the excellent houses of the eighteenth century. It is economically planned and contains ample accommodation for a family. The house is intended to be built of purple-grey bricks with orange-red quoins and arches, and to be roofed with hand-made tiles. The cost would be from £1,000 to £1,400 according to the sizes of the rooms, the dining-room being 21 feet by 18 feet and the drawing-room 18 feet by 18 feet at the higher figure.

Telephone: 2215 Victoria.

DESIGN NO. 63.

THE FRONT VIEW,

This bungalow is intended for a residence near the sea. Its disposition is arranged so that whilst its living-room faces due south, the dining-room, den and the bedrooms would not be exposed to the full glare of the sun, but still would receive sunshine at some period of the day.

Four bedrooms besides the maids' bedroom are shown on the plan, but others could readily be added at a small extra cost. A "gazebo" is arranged in the roof over the living-room.

Fireplaces are provided for the living-room and dining-room only besides the kitchen range, but a moderate amount of warmth could be obtained from these by means of hot-water pipes and radiators leading to the other rooms if desired.

The house being intended for a summer residence, it is not necessary for all the bedrooms to be provided with fireplaces. They would have ample ventilation without and would not require artificial heating. The ample verandah would provide for living outdoors in either rainy or very hot weather.

Where modern methods of building are permitted by local by-laws, this bungalow could be built for £600.

"LOCO"-GAS.

FOR ECONOMY AND BETTER LIGHT MAKE YOUR OWN GAS.

GLENVEAGH CASTLE.

"Loco" Air-Gas Installed May, 1909.

120 Lights.

UNSOLICITED TESTIMONIAL FROM THE OWNER.

"I must tell you how delighted I am with the installation of "LOCO" AIR-GAS at Glenveagh Castle. It is such a success. The light is so brilliant and soft; all my guests were also full of praises, and the cost is so wonderfully small compared with other lights. It is exactly suited to large country houses."

This simple little machine does all this lighting in a most satisfactory and economical manner (see testimonial), and is still running, and likely to continue for over twenty years. Select a machine not made of tin with soldered joints, or of galvanised iron, which materials are known soon to perish, but of substantial cast iron, solid drawn steel piping, and gunmetal, screwed together in a safe, permanent, and mechanical manner.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie-Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

MODEL SHOWROOMS.

EVERY year witnesses the closer approach of the producer to the consumer. Very often this is done though an intermediary who links the two together by winning the confidence of both parties. The present-day motto in a wholesale business seems to be "Come and See for Yourself." The present is essentially an age of window-dressing and of the show-room. Both features have produced almost a science of their own, in which new developments are constantly being made. We imagine that one of its first laws must be "elimination," by which we mean the sacrifice of many things in order to concentrate on a few. This heroic principle has been admirably borne in mind by Messrs. Falk, Stadelmann & Co., Ltd., London and Glasgow, in the arrangement of their latest electrical show-rooms at 83-87 Farringdon Road, E.C. Here may be noticed the evolution of the science from the time when the chief effort was to cram as many examples into a given space as it would hold to the present day, when each example is separately presented, so to speak, to the possible purchaser.

First comes the old-fashioned show-room, which contained *multum in parvo*; then a more conscious striving after effect by the suggestion of a living-room, with its furniture, fire and windows, until the show-room with all its contents accurately carried out according to some particular Period is reached. Messrs. Falk, Stadelmann & Co. have gone one

step further, for their climax is to reveal to the visitor at the far end of their largest show-room a perspective of meadow and meandering stream bathed in sunlight or moonlight, according to the time of day in Farringdon Road. The firm are so fully alive to the importance of electrical fittings being designed in harmony with the room for which they are intended that they have chosen this elaborate way of suggesting to customers what they are ready to do. The Jacobean Room, for instance, with its massive fittings, bears no likeness to the adjoining elegant Louis Seize salon here illustrated. In reality a large display is made in each room, but it is arranged so cunningly that there is none of the usual impression of bewilderment. Nearly each fitting is wired, in order that the customer can see exactly the effect when the light is switched on instead of having to guess at it. Some of the pendant lamps and electroliers are real works of art. There is something for every purse, as well as for every taste. The firm have carried out their scheme with whole-hearted thoroughness, and the show-rooms will astonish the many people who have never considered the possibilities connected with such fittings. Artistic decoration need no longer be jeopardised by the incongruous character of the wall-brackets, pendants or radiators. It would be advisable for architects to pay these show-rooms a visit, with or without their client, in order to realise what has been done towards the improvement of the general standard of taste in electrical fixtures, and they are invited to call at 83-87 Farringdon Road, E.C.

THE SMOKE NUISANCE.

A BULLETIN recently published by the Department of Industrial Research, University of Pittsburg, gives some interesting details of an investigation which is now being carried on in that city into the smoke nuisance. The Director of the Department, Professor R. K. Duncan, has received from a private donor a fund for the purposes of the investigation. At the present moment the inquiry is being conducted by a staff of twenty-five specialists, six of whom are giving their entire attention to the work, while the remaining nineteen have been entrusted with the preparation of special reports concerning particular phases of the subject. Among these are such questions as the effect of smoke upon weather, upon vegetation, the chemistry of smoke and soot, the deterioration of buildings and building materials in smoky atmospheres, smoke and disease, the cost of the smoke nuisance, the question of legal regulation, &c. Under the direction of Professor Duncan the investigation will, no doubt, be extremely thorough, and the results ought to prove of great value. Not the least interesting part of the work will be an attempt to educate public opinion in the matter. It is proposed to make a systematic effort to enlighten civic and business organisations, and to arouse them to combined

entirely independent of weather conditions. Once Beaver Board is erected it is said never to need repairing or replacing. In the words of the booklet, "It lasts as long as the building itself."

Beaver Board is a pure wood-fibre wall-board, cream-white in colour, and has a matt or pebbled surface admirably adapted to artistic decoration. It is manufactured entirely from selected woods, reduced to fibrous form, and pressed into panels with a uniform thickness of about three-sixteenths of an inch. The panels are procurable in sizes which will meet all ordinary requirements, and they can easily be bent to cover an arch or cove ceiling. Beaver Board is just nailed up in panels and then painted or distempered, the joints being covered over with strips of wood which are either polished, stained, or painted, according to the result desired. The method of application is simple, yet the variety and beauty of the results possible are surprising.

In a new building not a square yard of lath and plaster is necessary. Beaver Board may take the place of both, and can be applied directly to ordinary studding and ceiling joists or over brick walls. It may be used for every room in the home, from cellar to attic, as well as for the walls and ceilings of shops, offices, hotels, restaurants, schools, factories, sanatoria, auditoriums, churches, bungalows, &c.

In an old building where the plaster is cracked or break-

A TYPICAL TREATMENT WITH BEAVER BOARD.

action. A staff of lecturers will be organised to address such organisations in Pittsburg and elsewhere; efforts will be made to secure the co-operation of the public Press, and, finally, the results of the whole inquiry will be published in book form.

"THE HOUSE THAT BEAVER BUILT."

THIS is the title of an interesting and useful booklet which tells about a new substitute for lath and plaster. Beaver Board has made such rapid progress in this country, however, that many of our readers have probably employed it already. The material appears to have such great advantages that it bids fair to revolutionise the present method of finishing walls and ceilings.

Beaver Board makes panelled walls and ceilings possible in every house; it opens out quite an extensive field for artistic decoration. In the booklet above-mentioned there are many illustrations showing the charming effects of these panels. Copies of it may be obtained from the Beaver Board Co., Ltd., 4 Southampton Row, W.C.

Architects and builders know too well that it is practically impossible to produce plaster that will not crack. But it is claimed that Beaver Board neither chips, cracks, nor deteriorates; in fact, the makers say that it actually improves with age. The dirt and litter accompanying the employment of plaster is also obviated. The contractor, moreover, does not have to wait for the plaster to dry, and he is

ing away Beaver Board is excellent. It may be put up without any trouble right over the broken plaster.

Many more interesting facts could be given about this material, but anyone who desires further particulars will do well to write for "The House that Beaver Built."

At the last meeting of the Bradford Corporation Sewage Committee the letting of the tender for the making of the outfall sewer and tunnel from Frizinghall to Esholt was reconsidered, and it was eventually decided to recommend the acceptance of the tender of Messrs. Pethick, Dix & Co., of London, at £113,971. Previously the committee had recommended the Council to accept the tender of Messrs. John Best & Sons, Ltd., of £112,312. Opposition was aroused concerning the acceptance of Messrs. Best's tender, opinion being divided as to whether the amount was £112,312 or £117,891, the difference being accounted for by the omission from the total of a sum which appeared on the attached schedule as the price of the work in connection with the sinking of the shafts. At a meeting of the City Council on Tuesday the Town Clerk read the correspondence between the Sewage Committee and Messrs. Best & Sons in regard to the omission. Messrs. Best stated that it was due to a clerical error, and that rather than forfeit the confidence of the Corporation they were prepared to stand by their original tender of £112,312, and give a written undertaking that they would complete the work of sinking the two shafts free of cost. After a full discussion the Council decided to accept the tender of Messrs. Pethick, Dix & Co.

THE GHENT EXHIBITION BUILDINGS.

THE two railway stations at Ghent are characteristic of the dual strength of the city—medieval beauty and modern industrialism. The old station in the centre of the town is thoroughly in keeping with its surroundings—it has a dignity, spaciousness, and even quietude. To find a restful flower garden in the centre of the station is an unusual delight.

The new station of St. Pierre on the main line (Brussels to the east and Ostend to the west being each less than an hour away) is thoroughly typical of modern progress. The building is an imposing structure, with a big tower to mark the entrance, a frontage extending about a thousand feet, well-planned booking-halls and offices.

From this station the Exhibition buildings stand out in striking dignity. Some are close at hand, others stretch a mile away. The nearer view is that of the dome at the chief entrance, flanked by minarets. Four colossal statues of the classical bull, one of the national emblems of Belgium, guard the doorways. A tour of the vast grounds of 350 acres discloses two features which promise well for the future of Ghent. First, that although the date of opening is six months or more ahead, everything in which the builder is concerned is also months ahead, and the smooth working of the many enterprises is already assured. The next striking point is that the whole business is the collective effort of a community and not of some mammoth contractor or speculative building firm brought in from outside. Ghent is building the Ghent Exhibition. Every firm of any standing appears to have a hand in the business. The promoters have done wisely in thus encouraging the progress all round of their own people. Nor is enterprise confined to the Exhibition grounds. The builder is busy on every hand—on an hotel which will accommodate a thousand guests, fine terraces of private houses, new shops and warehouses, well designed streets and squares.

The 27 acres of industrial palaces which will house the international display are already nearly covered. The British, French, and Belgian palaces are already roofed in. In the opinion of many, the total effect will be finer than the Brussels Exhibition, the setting being so much more spacious, the surroundings so perfect. As the last touches are being given to the roofs, there can be no risk from winter or even autumn gales and storms. The concrete flooring and the special beds for machinery will thus be laid under most favourable conditions, and the decorative finishing touches should be carried on without the customary final rush. The directors encourage the exhibitors to keep up to time by making a concession of 20 per cent. to all stands which are fully ready before the opening day. The position of the British exhibits is exceptionally good, as the entire stream of visitors will pass the main front, and the throng to and from the horticultural shows will pass another. Still another front looks on to the executive bureau.

The central courts are distinguished by a well-planned lake, as in the White City, but their most striking feature is the classic marble fountain across the full sweep of the central avenue. The central courts are not only outlined by avenues of trees already flourishing, but are bordered by spacious colonnades. The absence of such shelter has been a serious defect in many exhibitions, the glare from pavements, white walls and glass roofs being a severe tax on the endurance of the sight-seer.

The greatest pleasure in this respect will be found in the sylvan setting of the Horticultural Palace. This being a permanent structure, will be a valuable acquisition to Ghent. The span of the roof is one-third wider than the Crystal Palace. The building is in the form of a vast cross, the long stem of which represents the horticultural show proper, and the broad transverse section, when fitted for seating at right angles, forms a magnificent theatre or concert-hall. Facing the entrance halls are vast hothouses. All these structures are already being roofed in, and it may be noted that roof and pillars are all fitted in revolving sockets, so as to allow movement and avoid fracture. The restaurants, each of which cover about three acres, possess central dining halls capable of seating a thousand or more, and are on the lines of another great Belgian enterprise—the Heliopolis Hotel, near Cairo. These are surrounded by half a dozen or more other dining halls.

Surrounding the Horticultural Palace will be a spacious promenade, built over the remains of the Old Citadel, erected a century ago by our Duke of Wellington, when Ghent was one of a chain of forts on the Belgian frontier

against Napoleon. Those who wisely plan their holidays far ahead and enjoy them all the more in anticipation will do well to ask the London Offices of the Ghent Exhibition at 1 Southampton Row, W.C., to send them from time to time the programmes of the Exhibition as published, so that they may be kept posted up as to excursion arrangements, tours, &c.

INTERNATIONAL BUILDING EXHIBITION, LEIPZIG, 1913.

THE closing date for applications by intending exhibitors at the "International Building Exhibition, Leipzig, 1913," has been extended from October 1, 1912, to January 1, 1913. Thus firms who intended to participate, but who hitherto have omitted to send in their application, still have an opportunity of securing the space they require.

How very much the general building-trade industry is interested in the forthcoming scheme may be judged from the fact that space has already been booked to the amount of a million marks.

The *Deutscher Reichsanzeiger* (Berlin) of October 14 publishes a notice whereby the law of March 18, 1904, for the temporary protection of patents, designs, and trade marks will be put in force in connection with the International Architectural Exhibition and Special Exhibitions to be held in Leipzig from May to October in 1913. Some particulars of the exhibitions were given in our issue of May 24.

MR. T. H. MAWSON, Hon. A.R.I.B.A., has recently visited Vancouver in connection with the scheme prepared by his firm for beautifying that city.

MR. A. E. MURRAY, R.H.A., F.R.I.B.A., has been elected honorary Professor of Architecture by the Royal Hibernian Academy of Arts.

THE laying-out of a garden suburb at Canniesburn, near Glasgow, on co-partnership principles will shortly be commenced. A ground plan for developing the whole estate has been prepared by Mr. Raymond Unwin. The allocation of ground space allows for twelve houses to the acre. Each house will be provided with plots of 30 feet in front and 50 feet at the rear. The architect for the houses about to be erected is Mr. John A. W. Grant, of Glasgow.

AT the last meeting of the Anglesey Education Authority it was reported that Mr. J. D. Prichard, Bethesda, whose tender for erecting the proposed Council School at Menai Bridge at a cost of £4,310 had been accepted, had refused the contract; that Mr. Geo. F. Williams, Carnarvon, whose tender was £4,323, was not prepared to accept the contract, and that the Building Committee had consequently let the contract to Messrs. R. & J. Williams, Bangor, at £4,731, this being 3 per cent. above their original tender. The action was approved.

ON Friday last, the 25th ultimo, a reception was held at the offices and showrooms of the Art Metal Construction Co., Ltd., who occupy considerable space in the new premises of Roneo, Ltd., which now form a striking landmark in Holborn. Until quite recently this Company was carried on as a department of Roneo, Ltd., but the rapid extension of their business made it advisable that an independent company be formed, although closely allied to Roneo, Ltd., with separate works at Thames Road, Silvertown, E., where are manufactured steel doors, architraves and partitions, library equipment and book stacks, filing cabinets, roll-top desks, counters, &c. The new offices and showrooms afford an exceptional opportunity for inspecting these various steel fittings, as they have been used both for equipping them and for reducing the risk of fire to a minimum by their fire-resisting qualities. Attention was at once claimed by a replica of a section of the book stacks recently erected in the Government Record Rooms at Poona, and carried three storeys high. Constructed in skeleton steel framing, the corridors are laid with inch glass slabs to give light to the floor below, and in all the details careful attention to make them both fireproof and hygienic is apparent. Photographs of similar installations at Mareschal College, Aberdeen, Edinburgh University, St. Andrew's Library, &c., were displayed. Specimens of their steel fireproof doors, as passed by the British Fire-Prevention Committee, were shown side by side with steel partitions as fitted to the s.s. *Carmania*, and which are similar in construction to those used in buildings; also steel shelving, lock-ups (ventilated when intended to hold clothes), counters, cashiers' desks, roll-top desks, filing cabinets suitable for public buildings, banks, or business offices.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list.)

ENGLAND.

CHESHIRE

Congleton.—Picture Palace, Mill Street.

CORNWALL

Cambourne.—House, Adelaide Street, for Mr. H. Harris.

CUMBERLAND

Cockermouth.—Nursing Home (£1,200).

Penrith.—Council School.

Secondary school, Skirsgill Road.

DERBYSHIRE

Bolsover.—Parish Church Hall (£1,000).

Mamhead (near).—House, &c., Larkbeare. Messrs. E. H. Harbottle (F.R.I.B.A.) & Son (of Exeter), architects.

DEVON

Exeter.—Messrs. Veale & Co.'s Factory, Bartholomew Street: re-fronting. Mr. J. Crocker, F.R.I.B.A., architect.

Newton Abbot.—Seven houses, Fairfield Estate, for Mr. F. J. Zealley.

Motor garage, back of Abbotsbury Road, for Mr. J. Barter.

Motor garage, at Elm Croft, for Mr. W. W. Wilkinson.

"Empire": alterations for Messrs. Poole.

"Wenwell": additions for Dr. Mapleton.

Additions to Newton Gas Company's Works.

Okehampton.—Barracks extensions.

DURHAM

Durham.—Miners' Hall extension.

Murton Colliery.—101 workmen's dwellings.

ESSEX

Clacton-on-Sea.—St. James' Church (£6,500).

HAMPSHIRE

Emsworth.—Baptist Chapel.

Portsmouth.—Municipal Tuberculin Dispensary.

Southbourne-on-Sea.—Club House

KENT

Erith.—Cinematograph Theatre, junction of Alford and Pembroke Roads, for Mr. W. T. Dolomere.

Gillingham.—Two bungalows, First Avenue, for Mr. G. J. Jeffery.

Shop, store and house, junction of Woodside and Springvale Road, Wigmore, for the Wigmore and District Small Holders' Club.

LANCASHIRE

Blackburn.—Workshop for the Blind (£1,500).

Bolton.—Bank premises, Bradshaw Gate: alteration for Lancashire and Yorkshire Bank, Ltd.

Four houses, Gregory Avenue, for Mr. Draper.

House, &c., Great Lever Park, Green Lane, for the Corporation Parks Committee.

Fifteen houses, Cloister Street, for Mr. E. Hargreaves.

Three houses, Uganda Street, for Mr. J. Hamer.

LINCOLNSHIRE

Barton-on-Humber.—Council School and cookery and manual instruction rooms.

Cleethorpes.—Council School, Reynold Street (£10,000).

Navenby.—Wesleyan Chapel.

Spalding.—Thirty-six working-class houses. Mr. E. Clarke (of Melton Mowbray), contractor (£5,200).

MIDDLESEX

Hanwell.—Dust destructor and buildings (£3,000). Accepted for two-cell destructor, Messrs. Heenan & Fronde, Ltd. (£1,333.)

NORTHAMPTONSHIRE

Burton Latimer.—Mr. Coles' Boot Factory: enlargement.

Corby.—Council School (£4,750).

Earl's Barton.—Church Institute, Station Road. Mr. H. W. Sheffield (of Wellingborough), architect (£600).

Messrs. Elson & Knight, contractors.

Towcester.—Council School (£3,000).

Wellingborough.—Council School, Park Street: re-building (£5,450).

NORTHUMBERLAND

Newcastle-upon-Tyne.—Picture Hall for the Moss Empires, Ltd.

Nine Banks.—Schoolmaster's house.

SHROPSHIRE

Clee Hill.—Council School.

Wellington.—Guardians' Children's Workhouse Quarters (£875). Mr. A. Jenkins, architect.

SOMERSET

Bath.—St. Luke's Church, South Lyncombe: extension for an additional 100 sittings (£1,900) Mr. M. A. Green, F.R.I.B.A., architect. Messrs. Chancellor & Sons, contractors.

Marston Magna.—Pair of cottages for Dr. W. Chatterton.

South Petherton.—Cottages, Watergore, for Mr. A. Allen.

STAFFORDSHIRE

Hanley.—All Saints' Vicarage and schools (£800).

Silverdale.—Cookery Centre. Mr. W. F. Slater (of Burslem), architect.

Stafford.—Thirteen cottages, Lammascote Estate, for Mr. T. Jones.

Stoke-on-Trent.—Cookery Centre. Mr. W. F. Slater (of Burslem), architect.

Wolverhampton.—Extension of the Briton Motor Company's Motor-car Works, Walsall Street.

Technical School, Wulfruna Street.

SURREY

Egham.—Boys' Secondary School.

Ham.—Artisans' dwellings. • Council surveyor.

SUSSEX

Eastbourne.—"Livingstone House": alterations for H.M. Office of Works.

"Upperton Lodge": alterations for Colonel W. A. Browne.

"Palgrave Mansions," Devonshire Place: addition for Messrs. Peerless, Dennis & Co.

Burlington Mews, Seaside: alteration for Mr. F. Bovill.

No. 14 Calverley Road: addition for Mr. E. H. R. Browne.

House, Dittons Road, for Messrs. A. W. King & Son.

Garage, Prideaux Road, for Mr. O. Bradford.

"Branksome," Saffrons Road: addition for Mr. W. M. Senior.

Four houses, Station Road, for Mr. E. Marchant.

No. 79 South Street: alterations for Eastbourne Artisans' Dwellings Co., Ltd.

Worthing.—Honey Factory, Ham Road.

WARWICKSHIRE

Hall Green.—Council School for 1,000 places. Great Mill Lane.

WORCESTERSHIRE

Kidderminster.—Four cottages, Churchfields, for Mr. J. Walters.

House, Bewdley Hill: additions for Mr. W. Johnstone.

Four houses, Park Lane, for Mr. G. Clark.

Worcester.—Boys' school, St. John's.

YORKSHIRE

Askrigg.—St. Oswald's Vicarage (£2,000). Messrs. Connon & Chorley, F.R.I.B.A. (of Leeds), architects.

Goole.—Catholic Church: tower.

Scarborough.—Municipal school extension (£1,600).

Sheffield.—Woodside Council School enlargement for an additional 180 places.

Thrybergh.—Roman Catholic School for 150 places.

WALES.

Briton Ferry.—Sixty-two working-class houses (£16,400). Mr. A. Clarke, architect.

SCOTLAND.

Cathcart.—Tenement, Rannoch Street, for Messrs. G. Eadie & Sons.

Clydebank.—Three-storey tenement with shops, Glasgow Road, for Mr. J. Dempsey.

Crieff Junction.—Hotel.

Elgin.—"Lochnabo Lodge": additions. Mr. E. C. Doig, architect.

Giffnock.—Church.

Double villa, Woodvale Avenue, for Mr. J. Allan.

Glasgow.—Dining-hall and offices, Tramways Car Depot, Albert Road, Crosshill, for the Corporation.

Tenements of dwelling-houses, Rutherglen Road, Govan, for the Corporation.

No. 155 Bath Street, Govan: additions and alterations for the School Board.

Merrylea Established Church, Newlands. Mr. P. McGregor Chalmers, architect.

Twenty-four terrace houses in Carnwath, Lauderdale and Gowrie Avenues, Newlands, for Messrs. G. Anderson, Ltd.

Double villa, Langlands Road, Newlands, for Messrs. J. Allan & Son.

Double villa, Mossfield Road, Newlands, for Messrs. G. Eadie & Sons.

SCOTLAND—continued.

Glasgow—continued.

Addition to works, Balmore Road, Possilpark, for the Glasgow Steel Roofing Co., Ltd.

Renfrew.—Picture Hall, Ferry Road, for the Renfrew Picture Palace, Ltd.

IRELAND.

Bailieborough.—House. Mr. G. F. Beckett, M.R.I.A.I. (of Dublin), architect.

Balla.—St. Patrick's Church. Messrs. Doolin & Butler, F.R.I.B.A. (of Dublin), architects.

Bandon.—Four Labourers' Acts cottages at Brinny, Kilbonane, and Knockroe, for the R.D.C. (£400.)

Castlereagh.—Fifty labourers' cottages, for the R.D.C.

Dublin.—Café, No. 125 Stephen's Green. Mr. T. J. Cullen, M.R.I.A.I., architect.

Eight attendants' cottages, Richmond Asylum.

Ninety working-class houses, Trinity Ward (£18,350).

Innishannon.—Labourers' Acts cottage, for the Bandon R.D.C. (£100).

Purdysburn.—Asylum extensions (£17,200).

Skibbereen.—Cottage at Hollybrook. Mr. J. F. M'Mullen, M.R.I.A.I. (of Cork), architect.

Stradone (near).—Doctor's residence for the Cavan Board of Guardians.

Templemartin.—Seven Labourers' Acts cottages for the Bandon R.D.C. (£700).

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 4. Jan. 1, 1912.—Improvements in and relating to brick perforating machines and the like. George Emmerson, 3 Brook Road, Woodsetton, and W. R. Mobberley, Woodsetton, near Dudley. This invention relates to a new and improved machine for the purpose of perforating bricks and slabs when in the form of plastic clay or other plastic substance. The invention consists of sliding carriages G and I, and fixed brackets A and C, mounted on a bench S. The sliding carriage G carries the perforating tubes D, on which are brazed or welded flanged collars E, these collars prevent-

ing the tubes from collapsing or "crushing in" when being gripped by the set screws F. The front end of the perforating tubes D are sharpened to a knife edge to facilitate their passage through the brick or slab. Fixed brackets, A and C, are pierced by holes, x, to admit the passage of the perforating tubes D. The sliding carriage I carries the tube cleaners or plungers, H, which are a sliding fit inside the perforating tubes. The fixed bracket A supports the brick or slab B during the process of perforation, and the fixed bracket C serves the purpose of holding the brick or slab while the perforating tubes D are being withdrawn after perforation. The sliding carriage G is connected by two drag-links, J, and two levers, L, to the rock-shaft, R, on which is also mounted the operating lever T. The sliding carriage I is connected by two drag-links, K, to lever n, which is carried on rock-shaft Q. The lever n is connected to levers L by two drag-links, M, in one end of which is a slot P, which slot slides along pin, O, which is fixed in lever n. After the perforating tubes D have passed through the greater part of the brick or slab, the tube cleaners or plungers, H, follow up and push out the cores that have entered the tubes during their passage through the brick or slab. On the return or backward stroke of the machine, the

sliding carriage I is pushed back by the sliding carriage G, thus completing the cycle of operations. Fig. 1 is a longitudinal sectional elevation showing the sliding brackets G and I at the commencement of their forward stroke and the brick or slab B in position between fixed brackets A and C.

ready to be perforated. Fig. 3 is a sectional elevation, and shows sliding carriages G and I at the end of their forward stroke, the sliding carriage I carrying the tube cleaners or plungers, H, having overtaken sliding carriage G, thus clearing out the perforated tubes during the latter part of their forward stroke. September 11, 1912.

PATENT SPECIFICATIONS PUBLISHED
OCTOBER 24, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 17,230. July 28, 1911.—D. H. Brownfield, "Kenilworth," Abbey Road, Llandudno, and Frederick Beech, 33 Lorne Street, Burslem, Stoke-on-Trent. Novel or improved composition for use in making fire-resisting bricks, quarries, tiles for fireplaces, and the like.

21,516. Sept. 29, 1911.—A. E. Bunge, 1122 Cuyo, Buenos Aires. Rubbish-burning apparatus combined with kitchen ranges.

22,234. Oct. 9, 1911.—Mrs. Mary Hooker, 76 Richmond Road, Kingston-on-Thames. Apparatus for making air-gas.

22,951. Oct. 18, 1911.—E. A. Ward, 186 Antrobus Road, Handsworth, Birmingham. Appliances for cleaning or removing obstructions from drain and other pipes, flues, and the like.

23,694. Oct. 26, 1911.—H. F. Berry, 9 Victoria Street, S.W. Apparatus for heating, drying, and otherwise treating stone and other materials for use on roads and life surfaces.

25,219. Nov. 13, 1911.—Maria Giese, Bottmuhle 3, Cologne, Germany. Manufacture of hollow floors and ceilings.

25,273. Nov. 14, 1911.—J. D. Prior, 197 Holliday Street, Birmingham. Domestic firegrates.

25,927. Nov. 20, 1911.—Gustave Moncany, 10 Cité Joli, Paris. Process for obtaining upon paper ornaments giving to the material the exact appearance of engraved or carved metals.

25,970. Nov. 21, 1911.—M. H. Robinson, Parliament Chambers, Great Smith Street, Westminster, S.W. Method of construction of piled wharves, piers and the like, and apparatus therefor.

27,830. Dec. 11, 1911.—E. F. Stimson, 88 Streathbourne Road, Upper Totting, S.W. Stoves.

28,649. Dec. 20, 1911.—F. T. A. Riley, 25 Sandy Lane, Accrington, Lancs. Domestic firegrates.

29,061. Dec. 23, 1911.—Robert Parry, 2 Grosvenor Street, Cheetham Hill, Manchester. Street and like gullies.

2,875. Feb. 3, 1912.—J. W. Glover, Ranelagh Works, Royal Avenue, and Geo. Glover & Co., Ltd., 122 King's Road, Chelsea. Leak detector for gas meters.

3,456. Feb. 12, 1912.—James Heaton, The Ravenhead Sanitary Pipe and Brick Co., Ltd., St. Helens, Lancs. Machine for cutting and shaping clay or the like plastic material.

5,380. March 4, 1912.—A. R. Groome, 2 Tower Villas, Tower Road, Hereford, architect and surveyor. Weather excluders for doors and casements.

6,201. March 12, 1912.—The Trussed Concrete Steel Co., Ltd., Caxton House, Tothill Street, Westminster, S.W. Ferro-concrete construction for floors and the like.

7,745. March 30, 1912.—Date claimed under International Convention March 30, 1911. Nino Magelssen, 9 Platongatan, Christiania, Norway. Manufacture of fireproof articles and fireproof coats on articles.

8,297. April 6, 1912.—Chas. Taylor (Birmingham), Ltd., Bartholomew Street, Birmingham, and W. Kennedy, 11 Furzeham Road, West Drayton, Middlesex. Attachment and "stirrup" of the like character for reinforcing concrete.

10,091. April 29, 1912.—Date claimed under International Convention April 29, 1911. Chas. de Vaulchier, 18 rue Saint-Georges, Paris, and Pierre Samain, Cusy (Haute-Savoie), France. Apparatus for regulating water pressure.

11,007. May 9, 1912.—J. J. Fraser, 16 Kersland Street, Hillhead, Glasgow. Manufacture of articles wholly or partly of artificial stone or marble and a composition therefor.

11,238. May 11, 1912.—Date claimed under International Convention May 12, 1911. Eduard Friedrich, 25b Carl Heinestr., Leipzig-Plagwitz, Germany. Breaking and crushing apparatus.

12,596. May 28, 1912.—J. De Mars, 2844 Twenty-First Street, San Francisco, California, and A. J. Walker, 356 Main Stret, Niagara Falls, U.S. Sash lock and anti-rattler.

13,653. June 11, 1912.—J. F. L. Nowell, 102 St. Stephen's Road, Hounslow, and J. S. Nicholas, 25 Hamilton Road, Harrow. Metal beams or girders.

14,097. June 17, 1912.—Date claimed under International Convention July 13, 1911. The Firm "Hermes," Schlossvertriebsgesellschaft, Neue Schonhauserstr. 8, Berlin. A safety device for window and door fasteners.

PROFESSIONAL ETHICS.

THE agitation now exercising the architectural profession at home regarding a code of ethics threatens, we much fear, says *Indian Engineering*, to accomplish too much. Not to say that there should not be certain offences which must be defined by code as unprofessional, but we have a fear that the inclusion of too many in such a code will have an insalutary effect on the architectural conscience, just as bringing up a child under too many restrictions often results in robbing him of a natural sense of responsibility, and warps his own judgment as to what plainly constitute right and wrong. Such a person falls an easy prey to temptation and, moreover, gives any natural ingenuity he may possess an impetus in the direction of finding out what he may do in order to circumvent the code. With a voluminous code will arise a tendency to judge a man only in accordance with its articles, just as a magistrate condemns or acquits a man according as he has or has not violated the strictly laid down laws of the penal code. The magistrate will tell you himself, as he has done on more than one occasion, that he is not on the bench for the purpose of administering justice, but the law. Accordingly, many an offender escapes who has done a palpable wrong but has kept outside the meshes of the law. In the same way, should the architectural bodies attempt too much codifying they might be placed in the position of the magistrate on the bench. Better for them to make a few salient regulations for their own guidance—that is, for the guidance of the selected few who will constitute the bench, while they give the profession at large to understand that they possess the right, by constitution, to arraign at their bar any who in their judgment are pursuing a course not in accordance with the dignity of the profession. It seems necessary in the first place to come to a decision as to which of the architectural bodies in the kingdom are of sufficient standing to contribute one, or more, members to an ethical council; it then follows logically that every individual calling himself an architect should be compelled to belong to one or other of these bodies, or consider himself an unrecognised practitioner. From each of these architectural bodies a strong council should then be formed, each body electing its own representative or representatives, the number to be regulated according to its strength and professional standing. In the hands of a council so constituted, which would presumably represent the pick of the profession, might safely be left all the jurisdiction ethics demand. The members would have only a few leading rules for their guidance; their own moral sense and good judgment would supply all the rest that would be demanded to determine whether a man has offended against ethics or has not. To this council full powers ought to be given, and from its decisions there should be no appeal. Nor should individual societies, once such a council has been formed, retain to themselves the right of sitting in judgment on one of their own body. Every offender against the ethics of the profession must go up to the one bar of judgment and stand or fall by its decision. We cannot help thinking that such a mode

of deciding will have a farther reaching effect than the action of so many men appointed just to interpret an elaborately drawn-up code. Before a bar such as this there will be no quibbling; each offender will understand that he is being tried not by a code which may be quibbled with, but by a sense of right or wrong in the abstract as it is in the minds of his judges. All in the profession who may be tempted to sail close to the wind in their transactions will have a wholesome fear that they may not escape, even when for such a venality as this they may have to answer to a tribunal not bound by the mere phraseology of a code, but by a wider horizon which includes what is bad form just as much as it includes what is palpable misdemeanour. A court of ethics, in short, should be constituted on the lines of what is known as a court of honour—i.e., it should be composed of a body of honourable men who will not need to open a book to tell them whether this or that man has sinned. Such a tribunal will, we think, have more terrors for the evildoer than any other.

VARIETIES.

A SCHEME is being pushed forward by the local authorities concerned for the provision of a bridge over the river Ouse at Boothferry. The cost of the work is expected to be £45,000.

THE Withernsea Urban District Council have instructed Messrs. Taylor & Wallin, Newcastle and Birmingham, to report as to whether a local source of water can be used for supplying the urban district.

THE Craven Committee have recommended for appointment to the Studentship at the British School at Athens Mr. Stanley Casson, formerly Exhibitioner of Lincoln College, now Senior Scholar of St. John's College, Oxford. The Studentship is of the value of £100.

THE Executive Committee of the Swansea Harbour Trust last week decided, owing to the increase in the tinplate and galvanised sheet trades, to advertise for tenders for the extension of the warehouse accommodation of the King's Dock, so as to provide an additional area of 17,000 feet.

H. M. CONSUL-GENERAL at San Francisco (Mr. A. C. Ross, C.B.) reports in the *Board of Trade Journal* that it is estimated that over £32,000,000 will be expended on public works in that city during the next two years. Of this amount \$59,000,000 (about £12,128,000) are to be spent in the erection of buildings, &c., for the Panama-Pacific International Exhibition. Among other items of proposed expenditure are the following: Harbour improvements, \$9,000,000; Civic Centre and City Hall, \$8,800,000; Opera House, \$1,000,000; City and County Hospital, \$230,725; Carnegie Library, \$750,000; refuse incinerators, \$190,413; fire equipment and stations, \$191,569; United States Sub-Treasury, \$500,000.

TRADE NOTES.

MESSRS. SIEMENS BROTHERS, Dynamo Works, Ltd., inform us that they have obtained the contract for the supply of "Wotan" traction lamps to the Great Indian Peninsular Railway Company for the ensuing twelve months.

MESSRS. GEORGE MILLS & Co., LTD., Globe Ironworks, Radcliffe, near Manchester, the proprietors of the "Titan" sprinkler, have received the following testimonial from Messrs. Wm. Adam & Son, Blantyre Saw Mills, High Blantyre, N.B.: "Last night (October 22) we had a fire in our saw mill beside the large circular saw, and had it not been for the very effective action of the sprinkler the whole building would have been burned. The two sprinklers above where the fire took place put it out before any of us got in. The bell wakened me, and I was pleased to see the splendid results."

THE difficulty in connection with the lighting of Holborn has been settled by a compromise. Originally the Works Committee of the Holborn Council recommended that the Gas Company's tender should be accepted, but as the tender worked out at a higher figure than the Electricity Supply Company's estimate, the Council referred the matter back to the Works Committee for further consideration. Eventually it was decided to light half of Holborn by electricity and half by gas. The electrical portion has just been completed. It extends from Chancery Lane to Kingsway. High efficiency Mazda drawn-wire lamps have been chosen, and a very fine lighting effect is obtained.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie-Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTS' ASSOCIATION.

A MEETING of local members of the Hampshire and Isle of Wight Architects' Association was recently held at the Hartley University College to consider the question of the proposed Day Classes in Architecture at the College. The chair was taken by Mr. Norman C. H. Nisbett, A.R.I.B.A., of Winchester. The Acting-Principal (Professor Eustice) and the Lecturer in Architecture (Mr. T. A. Parker, A.R.I.B.A.) gave particulars of the provision made in the College for architectural courses.

The Secretary of the Association (Mr. R. M. Lucas, F.R.I.B.A.) stated that he would bring forward at an ordinary meeting of the Association the following recommendations, viz.: "That in order to encourage prospective pupils in architecture to take up a course, those who have successfully passed through an approved course of study, extending over two years, should be admitted as pupils in architects' offices at a reduced premium and for a shortened period of pupilage."

It was also agreed to recommend that "Pupils should be encouraged to pursue their studies concurrently with their office work by attending evening classes, and in special cases by attending day classes in work bearing on the architectural profession."

HOUSE AT ILKLEY.

THIS house has been erected for Mr. Oliver Greenwood, of The Grove, Ilkley. It is built of common bricks, and covered with cement rough-cast and finished white, and has a red-tiled roof. It contains a hall panelled in oak, at one side of which three arches lead to the staircase, kitchen, offices, cloak-room, &c. There is a large sitting-room and dining-room, entered from the hall, and on the first floor four bedrooms, bath, linen and housemaid's room. The roof is constructed so that three more rooms can be added if required.

The works have been carried out under the superintendence and from the designs of Mr. W. H. H. Marten, Lic.R.I.B.A., Leeds.

ST. ANTHONY'S SCHOOL, BEESTON.

THIS school has been designed for 400 children at a cost of about £6 15s. per head (without land). It has been erected by its promoters with the double object of conforming to all requirements of the Educational Authority for teaching purposes and to provide an Assembly Hall for the parish. The latter idea is effected by movable screens,

Sons, builders, of Beeston, from the drawings and under the superintendence of Mr. W. H. Herbert Marten, Lic.R.I.B.A., architect, Leeds.

ST. ÆLRED'S CHURCH, STARBECK.

THE plan of this church is so arranged that extensions can be made without pulling down any of the main structure or walls; at the same time, it is a complete church in itself. It consists of a simple nave arcade, chancel and sanctuary, with small lady altar on one side and sacristy on the other; there is also a porch and spacious vestibule. The nave arcade (which is formed of terra-cotta arches in red and buff alternate bands) is filled in with wood traceried windows, with cement panelled dados below the springing of the arches. These windows and panels can be removed with little trouble when the aisle extensions are required and placed in the new walls, thus saving any waste. The sanctuary is in the form of an apse with domed roof, and is separated from the nave by a terra-cotta arch, on either side being Gothic screens dividing off the lady altar and the sacristy. There is also an arch at the entrance to the nave from the vestibule, the lower part of which is filled in with

HOUSE AT ILKLEY.—Mr. W. H. HERBERT MARTEN, Lic.R.I.B.A., Architect.

by which means five classrooms used for boys and girls are thrown into one large hall, thereby giving seating accommodation for 450 persons, and leaving space for a platform at one side, the two rooms for teachers, one on either side, being suitable for retiring-rooms.

The style of the building itself is scholastic and simple, no money being spent on anything but which is absolutely necessary for the purpose. The lower ground level is exclusively for infants' use, and has three classrooms with south aspect. These can also be converted into one large room by movable screens. There is a corridor hall for marching or playing purposes on wet days, with teachers' rooms overlooking same.

Every room in the building is cross-ventilated, and is so arranged that the ventilation cannot be interfered with summer and winter alike. For cold weather, warmth is supplied by means of radiators and heating-pipes, and external roof ventilators carry away the vitiated air from every room and corridor.

The building is mainly of fire-resisting construction, and the works have been executed by Messrs. Joseph Pullan &

a traceried glass screen with swing door, surmounted by a cross. The main floor of the church is to be of maple boards laid solid on coke breeze and concrete, the walls being of local brick. The ceiling is boarded and broken into panels by the main timbers, and plastering is dispensed with. The whole church is abundantly lighted with large windows of leaded cathedral glass.

The works are being executed by the following contractors, all local firms:—Mr. C. A. Nettleton, masonry and brickwork; Mr. E. Thomas, joiner's work; Mr. J. Hannam, plumber's work; Messrs. A. Calverley & Sons, "Marblite" work; Mr. J. Shepherd, slating and tiling; Messrs. Jessop & Cosgrove, painting, &c.

The total cost of the work finished complete (exclusive of furniture) is £723, and it has been carried out from the designs and under the supervision of Mr. W. H. Herbert Marten, Lic.R.I.B.A., Leeds.

THE Lincoln City Council have agreed to purchase thirty acres of land at Fenwick for £7,673 as a site for a refuse destructor.

ST ANTHONY'S CATHOLIC CHURCH SCHOOLS BEESTON LEEDS

ST. ELRED'S CHURCH, STARBECK.

In the Liverpool building trade the workers have instituted a movement to secure a higher rate of wages for the men engaged in the various departments. Notices to this effect have been sent to the Liverpool Master Builders' Association on behalf of the men. The joiners, who at present receive tenpence per hour, ask for one shilling; the bricklayers, who are paid tenpence, desire a rise of one penny; and the masons, who are paid tenpence per hour, demand one shilling; while slaters ask an increase of one penny on their present wages of ninepence halfpenny per hour.

MR. H. S. GOODHART RENDEL, on behalf of Major E. M. Dunne, has offered the London County Council a rent of £155 a year for a lease for 99 years of a site on the north side of the junction of Dean Trench Street and Tufton Street, Westminster. The site has an area of about 2,379 square feet, with a frontage of about 38 feet to Dean Trench Street. The site has not been submitted to auction, but boards have been erected on which notices have been displayed intimating that the land is to be let. The Improvements Committee recommend that the offer be accepted.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local).

ENGLAND.

CHESHIRE.

Birkenhead.—School, Church Street, Egremont (£4,500).

Workmen's dwellings (£4,200).

Macclesfield.—Conservative Club. Mr. J. E. Burgess, architect.

 trolled doors.

19,885. Aug. 31, 1912.—John Levick, Metal Spinning
 Works, Alma Street, Aston, Birmingham. Means for hold-
 ing and preventing rattling of windows, doors, and the like.

FIRE PREVENTION.

RECENT fires, such as those at Messrs. Barker's, at Messrs.
 Arding & Hobbs', in Moor Lane, &c., should impress upon
 manufacturers, shopkeepers, and warehouse proprietors the
 necessity of adopting systematic fire preventive measures, and
 of keeping themselves posted as to modern safeguards and
 forms of fire preventive organisation and the value of
 obtaining independent technical advice when the occasion
 calls.

The British Fire Prevention Committee, an institution
 of some fifteen years' standing, whilst formerly mainly
 doing work only in the interests of the public authorities,
 has recently placed its valuable reports, publications, "warn-
 ings," and "cautions" at the disposal of the general public,
 so that any Corporation or firm can subscribe to this useful
 service (at a nominal two guineas per annum), and also make
 use of the committee's technical inquiry office.

A number of notable and successful concerns subscribe to
 this service, and we suggest that if the service were more
 widely known the roll of users would soon touch four figures.

It cannot pay any well-managed firm—no matter how
 well insured—to have a fire, owing to the resultant disor-
 ganisation and loss of business, whilst the odium occasioned
 by the loss of life on the premises instils prejudice and takes
 years to wipe out.

The British Fire Prevention Committee's reports already
 number 175. Its activity on the occasion of the Coronation
 may be remembered. It has its own testing-station at
 Regent's Park, and central offices at Waterloo Place. It
 commands the talents and assistance of practically everybody
 who counts on the scientific side of fire prevention, and
 enjoys the confidence of the public departments at home and
 in the Colonies. Its reliability and independence are pro-
 verbial, and a user of its service generally finds the amount
 of work done is remarkable in proportion to the annual sub-
 scription, which is due to the fact that all the technical men
 engaged on the British Fire Prevention Committee work
 voluntarily, and, as a matter of fact, even contribute liberally
 to the cost of the research work done and publications issued.

All inquiries should be addressed to the Assistant Secre-
 tary, British Fire Prevention Committee, 8 Waterloo Place,
 London, S.W.

THE Beverley Corporation have concluded negotiations
 with a view to the establishment of a factory for the manu-
 facture of imitation silk. About fourteen acres have been
 purchased on the banks of the Barmston Drain as a site.
 The new works will employ at the start about 900 hands.

COMPETITION NEWS.

CHORLEY.—Owing to the unusually large number of designs sent in for the new Council School in Duke Street, the Education Committee have agreed to increase the rate of remuneration of the assessor, Mr. J. Brooke, to fifty guineas, plus travelling and out-of-pocket expenses.

INDIA.—The Government of India invite architects and others residing in India to submit by Dec. 7 competitive designs for residences to be erected at Delhi. The designs will be judged by a committee assisted by the Consulting Architect to the Government of India acting as assessor. Premiums aggregating 12,600 rs. are offered for the successful designs, subject to the conditions of competition.

SWANSEA.—The Borough Council have decided to invite competitive plans for a school to be erected at Baptist Well.

WIGAN.—At a meeting of the Education Committee the following tenders were submitted in connection with the appointment of architect for the new girls' high school, in accordance with the terms of the advertisement:—Messrs. Geo. Heaton & Sons, 5 per cent. on the cost of the buildings, plus $\frac{1}{4}$ per cent. for quantities. Messrs. Prescott & Bold, 5 per cent. on the cost of the buildings, plus $\frac{1}{2}$ per cent. for quantities. Messrs. J. B. & W. Thornley, inclusive fee of 5 per cent. on the outlay, made up as follows: $\frac{3}{4}$ per cent. for all preliminary sketches, &c., plus $\frac{1}{2}$ per cent. for bills of quantities. Messrs. Unwin & Holland, 5 per cent. on the cost of the buildings, plus $\frac{1}{2}$ per cent. for quantities. Messrs. W. C. Ralph & Son, 5 per cent. on the cost of the buildings, plus $\frac{1}{2}$ per cent. for quantities. It was resolved that the tender of Messrs. W. C. Ralph & Son, of Wigan, be accepted, and that they be appointed as architects for the proposed new school.

USHER HALL ORGAN, EDINBURGH.

The Lord Provost's Committee of Edinburgh Corporation last week considered the report on the estimates for the Usher Hall organ, submitted by the three experts to whom the matter was remitted—Sir Frederick J. Bridge and Sir George C. Martin, London, and Mr. Thomas H. Collinson, Edinburgh.

The report was as follows:—We have carefully examined the specifications and offers sent to the Town Clerk, Edinburgh, for the building of the organ for the Usher Hall, in response to advertisement by him, from the following offerers (arranged alphabetically), viz.:—

J. J. Binns, Bramley, Leeds; Bishop & Son, 20 Upper Gloucester Place, London, N.W.; Brindley & Foster, Sheffield; Evans & Barr, Ltd., Belfast; Forster & Andrews, Hull; Harrison & Harrison, Durham; William Hill & Son, 372 York Road, Camden Road, London; Ingram & Co., Edinburgh; Jardine & Co., Ltd., Old Trafford, Manchester; E. H. Lawton, Aberdeen; Lewis & Co., Ltd., 234 Ferndale Road, Brixton Road, London, S.W.; Morgan & Smith, Ltd., Hove, Brighton; Norman & Beard, Ltd., 61 Berners Street, London, W.; Rushworth & Dreaper, Liverpool; Scovell & Co., Ltd., Edinburgh; Stephen Taylor & Son, Leicester.

Having had before us the general conditions of specification and relative plan referred to in the advertisement, and having met together and discussed the above specifications, we hereby recommend the Lord Provost, Magistrates, and Council of Edinburgh to accept the tender of Messrs. Norman & Beard, Ltd., at the sum of £3,500, whom failing, we recommend in the second place the schemes of Messrs. Harrison & Harrison and Messrs. Hill & Son, as of equal value, with the observation that that of Messrs. Harrison & Harrison is more suited to concert purposes.

The Town Council have adopted the report and will accept the tender of Messrs. Norman & Beard, Ltd., London.

VARIETIES.

The London County Council on Tuesday approved the appointment of Mr. George William Humphreys, M.Inst.C.E., as the Chief Engineer of the Council, at a salary of £2,000 a year.

Mr. C. S. SPOONER, F.R.I.B.A., London, has prepared the plans for the church about to be erected at Aldersbrook, near Wanstead. The first portion of the work is estimated to cost £4,000.

MESSRS. WALSH & NICHOLAS, architects, Halifax, have prepared plans for a church to be erected at Siddal, Yorks, at a total cost of £8,460. The work will be carried out in two sections, the first involving an outlay of about £3,000.

The Education Committee of the London County Council recommend that an elementary school for 1,024 children should be erected on the site in the neighbourhood of Harrow Road, Paddington, N., which was purchased a few months ago.

The time allowed the London County Council for the completion of the works authorised by the County Office Site (London) Act, 1906, will expire in 1913. It is proposed to seek Parliamentary authority for an extension of five years for the completion of the new County Hall.

The Council of College Hall, founded to meet the need for a hall of residence for women students of university rank in London, propose to acquire a site and erect a new building at a cost of £30,000, towards which £8,400 has been promised or received.

PARTICULARS have been issued of the scheme of competition for the scholarship in decorative painting at the British School at Rome, offered by the Commissioners for the Exhibition of 1851. The scholarship will be of the value of £200 per annum, and will be ordinarily tenable for three years. Candidates must be British subjects, and less than thirty years of age on July 1, 1913. The competition, which will be conducted by the Faculty of Painting of the British School at Rome, will be in two stages: (a) An open competition, and (b) a final competition, open to not more than four candidates selected from those competing in the open examination.

MR. B. T. BATSFORD will publish in a few days Mr. L. A. Shuffrey's long-promised work on "The English Fireplace and its Accessories from the Earliest Times to the Nineteenth Century." He will also issue "Old Houses and Village Buildings in East Anglia," by Basil Oliver, A.R.I.B.A., forming the fifth volume of his well-known "Old Cottage" series. Both volumes will be fully illustrated by collotype reproductions of photographs of the most interesting examples, accompanied by numerous sketches and measured drawings.

THE Ashton-under-Lyne Board of Guardians have received a letter from the Local Government Board stating that attention had been called to the practice of the Guardians of restricting tenders to persons living in the union. In the interests of the ratepayers, the letter continued, the Guardians should abandon the practice. The regulations provided that forms of tender should be supplied by the Clerk to any person requiring them, and the Board were of opinion that tenders on the prescribed form should be received and considered by the Guardians. If the Guardians refused to receive and consider tenders from persons outside the union, the provision would be inoperative. The Board further pointed out that it was not to be inferred from the fact that advertisements appeared in papers in the union that it restricted tenders to persons having business or living in the union.

TRADE NOTES.

MESSRS. SMITH & DAVIS, LTD., of Beacon Works, Hampton Street, Birmingham, are placing upon the market their patent Beacon indicating door bolt, by which it is possible at a glance to see whether the room is vacant. The bolt is very simple, it is easily fixed, and cannot easily get out of

order. Another valuable patent the firm have on the market is their Beacon patent sash lift. By the use of this patent lift, it is claimed, there are no more torn curtains or blinds.

THE "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Palace Theatre, Westcliff-on-Sea.

MR. F. J. BARNES, of Portland, Dorset, informs us that the Portland stone required for facing the fronts of the new Waterloo Station is being obtained from his quarries. Amongst other London contracts supplied from the same quarries are the Tower Bridge; Waring's new premises, Oxford Street; new Polytechnic, Upper Regent Street; Piccadilly Hotel, and Lloyd's Bank, St. James's Street.

"LOCO"-GAS.

FOR ECONOMY AND BETTER LIGHT MAKE YOUR OWN GAS.

GLENVEAGH CASTLE.

"Loco" Air-Gas Installed May, 1909.

120 Lights.

This simple little machine does all this lighting in a most satisfactory and economical manner (see testimonial), and is still running, and likely to continue for over twenty years. Select a machine not made of tin with soldered joints, or of galvanised iron, which materials are known soon to perish, but of substantial cast iron, solid drawn steel piping, and gunmetal, screwed together in a safe, permanent, and mechanical manner.

UNSOLICITED TESTIMONIAL FROM THE OWNER.

"I must tell you how delighted I am with the installation of "LOCO" AIR-GAS at Glenveagh Castle. It is such a success. The light is so brilliant and soft; all my guests were also full of praises, and the cost is so wonderfully small compared with other lights. It is exactly suited to large country houses."

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 1s. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie—Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BIRGE LEATHER.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

SHEFFIELD.—Nov. 23.—The Guardians of Ecclesall Bierlow Union invite plans for a temporary hospital to be erected at the workhouse to accommodate twenty-four beds, with administrative quarters, dayroom, &c. The ordinary rate of commission will be paid in respect of the plan which is accepted, and no financial liability will be undertaken for rejected plans. Mr. J. E. Moulding, clerk, Union Offices, The Edge, Sheffield.

CONTRACTS OPEN.

THE building trades are very satisfactorily represented in the list of Mayors elected last Saturday in the twenty-eight Metropolitan boroughs in the County of London. Among the names are Alderman H. G. Handover, of Paddington (builder); Mr. H. G. Norris, of Fulham (builder and estate agent); Alderman A. D. Dawnay, of Wandsworth (constructional engineer); Alderman H. Lyon Thomson, of Westminster (electrical engineer); Alderman Jabez Williams, of Lambeth (timber merchant); Alderman W. G. Spittle, of West Ham (builders' merchant); Alderman J. Scott Balfour, J.P., of Hornsey (iron merchant); and Mr. C. FitzRoy Doll, F.R.I.B.A., F.S.I., F.Z.S., of Holborn (architect).

THE TALBOT STAND AT OLYMPIA.

DURING this week Olympia has been the Mecca for many thousands of motorists, past, present, and future. Conspicuously placed at the Addison Road entrance is the "Invincible" Talbot Stand, No. 69. Here expert and tyro alike find occasion to make a lengthy pause. For the latter there is the fascination of looking at a make of car that has long been industriously establishing sensational records in many different parts of the world. For example, last August, in a petrol consumption test held by the Automobile Club of Australia, a 12-h.p. Talbot came first by running no less than thirty miles on 2.5 pints, equivalent to ninety-six miles per gallon. This is, we believe, almost 100 per cent. better than the previous record. But what has done most to win the Talbots their present reputation is their hill-climbing prowess, which has been proved time and again. The expert visitor to Stand 69 will notice with delight that the 12-h.p., 15-h.p., and 25-h.p. cars all have the new type of front axles with ball-bearing pivots, as previously fitted to the

20-h.p. model only. All these four models have a new and improved aluminium dashboard, which contributes considerably to their general smart appearance. Other excellent advantages of this make of car are the stiffening of the frame and steering column, the countersunk fitting of recording instruments, and the ease of detachment of the body without disconnecting any wires or engine fittings. It is worthy of note that the Clement Talbot works, being in Barlby Road, North Kensington, are only a few minutes' run from Olympia. It is possible, therefore, to see a car in the making almost immediately before or after seeing the same type on the stand.

The Clement Talbot, Ltd., showed their customary alertness when on Monday morning last, the 11th inst., a booklet containing a *résumé* of the notices appearing in a number of the leading journals on the 9th and 10th inst. was obtainable on Stand 69. A copy of it may be obtained post free from the works.

MR. TEMPLE MOORE, architect, London, has prepared plans for a church about to be erected in the newly formed parish of St. Cuthbert, Preston. Seating accommodation will be provided for 750 persons, and the estimated cost is £11,500.

MESSRS. F. MATCHAM & Co., architects, London, have prepared the plans of a boxing-ring and cinematograph hall proposed to be erected at 100 Whitechapel Road, on a site part of which was formerly occupied by Wonderland and part by the East London Palace. The premises will have accommodation for about 2,800 persons.

THE Cambrian Archaeological Society will hold its annual meeting next year, jointly with the Wiltshire Archaeological Society, at Devizes. Professor Boyd Dawkins is the new President of the Cambrian Society, and Mr. W. Heward Bell, High Sheriff of Wilts, is President of the Wilts Association. The local Secretary for the meeting will be Mr. B. H. Cunningham, F.S.A. (Scot.), who is a member of both Societies.

An exhibition of the etchings and lithographs of Mr. Joseph Pennell will be held at the galleries of the Fine Art Society, 148 New Bond Street, during December, opening with a private view on November 29 and 30. The collection shown will be a very complete one, the first on any such scale held in London, and will include the recent important series of lithographs executed by Mr. Pennell to illustrate the construction of the Panama Canal.

CONCRETE BLOCK COTTAGES.

THE accompanying illustration shows six of a number of cottages erected at Talbot's Inch, Kilkenny, Ireland, for the Kilkenny woodworkers, workers in the woollen mills and tobacco plantation, which industries are being fostered under the patronage of the Right Hon. Ellen Countess Dowager of Desart.

The plans show a most economical and admirable disposition of rooms, the large living-room and good-sized scullery being a great boon to the cottager, not to mention the provision of three bedrooms—necessary accommodation where there is a large family, and which is too often overlooked in the housing of the working classes. Attention should also be drawn to the grouping of the fireplaces, one set of breasts and stacks serving two houses. Nor has the architect, Mr. F. W. Kiddie, manager at Talbot's Inch, overlooked artistic

ing to the by-laws of the district), bonded together with ordinary wall ties. Perfectly dry buildings are ensured.

For the manufacture of these blocks various machines have been placed on the market, and one which stands pre-eminent is that already mentioned—namely, the "Winget," manufactured by the Winget Concrete Machine Co., Ltd., 5 Star Buildings, Newcastle-on-Tyne. This machine has been sent to all parts of the world, and blocks made on it used in the construction of farm buildings, cottages, bungalows, villas, officers' and men's quarters, prisons, administrative buildings, post offices, banks, village halls, theatres, schools and colleges, chapels, hospitals, mills and factories, test houses, boundary and retaining walls, electricity sub-stations, sea walls, various harbour works and reservoirs, shaft linings and arched roads, underground roads in collieries, and has also turned out thousands of yards of kerb and partition slabs.

CONCRETE COTTAGES, TALBOT'S INCH, Co. KILKENNY.—MR. F. W. KIDDIE, ARCHITECT.

effect. The arrangement of the large gabled windows, the contrast afforded by the rock-faced "Winget" blocks on the ground floor, the rough cast on the first, and the red fibro-cement tiles combine to give the exteriors a most pleasing appearance.

Such buildings as these will do much to overcome the antipathy with which concrete buildings have hitherto been regarded. The whole of the cottages have been erected in concrete blocks manufactured on the "Winget" machine, as were also the partition slabs for internal walls and the gate piers.

In some instances the results obtained in the past in the construction of concrete buildings have not been satisfactory, but there is no need for this condemnation to continue. It has been proved again and again that where suitable aggregate can be obtained such buildings can be erected at a cost which can compare more than favourably with either timber, stone or brick. If their hygienic value, as well as their lasting qualities and freedom from the expense of repair and upkeep, be also taken into consideration, they will be found much more economical. Certain points, however, must be adhered to in order to ensure satisfactory results. The grading of the aggregate is of primary importance; sufficient fine must be incorporated to make the block perfectly homogeneous, and the block must be thoroughly tamped. The finished block must then be kept watered for at least ten days, after which, to be thoroughly matured, it should be left for one month, when it will be ready for use. Where these precautions are taken in the manufacture of "Winget" concrete blocks and care exercised in the erection there is no need to fear damp—one of the points raised against the adoption of this method of construction.

If the climate is at all humid, and further precautions deemed advisable, the outer walls may be built on the cavity system, say two 4½-inch leaves with 2-inch cavity, or (accord-

These facts clearly demonstrate its immense adaptability. Its absolute simplicity of working, combined with the large output which can be obtained, place it in the front rank of concrete block-making machines.

It is proposed to establish a School of Mining, with special reference to quarrying, in connection with the University College of North Wales. At present there is no school of mining which deals with quarrying within the United Kingdom.

At the annual meeting of the South Shields branch of the Northern Counties Federation of Building Trade Employers, held under the chairmanship of Mr. Thomas Anderson, a satisfactory financial statement was presented. Mr. W. V. Jary was unanimously elected president for the ensuing year, and Messrs. John Christie and C. Tate vice-presidents. Mr. Alexander Ross was reappointed hon. treasurer, and Mr. F. E. Hannay secretary.

According to the *Board of Trade Journal* the Argentina *Boletín* of September 27 contains a decree authorising the General Directorate of Architecture to proceed departmentally with the supplementary work connected with the enlargement of the Casa de Moneda in Buenos Aires. The cost of this enlargement will amount to about £33,300. The same issue of the *Boletín* includes a decree authorising the said Directorate of Architecture to erect a night refuge home at Buenos Aires harbour, at a cost of about £90,000.

The Sheffield Builders' Exchange held last week their annual meeting. The reports showed that the Exchange had enjoyed a most successful year, and that there was a good balance in hand. Mr. W. H. Ibbotson was elected President, and Mr. W. C. Fletcher and Mr. J. D. Cook Vice-Presidents. Mr. Cook is also Treasurer, a position he has held from the beginning of the Exchange.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local).

ENGLAND.

BUCKINGHAMSHIRE.

Amersham.—Bungalow, Lexham Gardens, for the Building and Estates Development Co. (Bristol).
Ashley Green.—Two houses, Lye Green, for Mr. S. Webber.
Chalfont St. Giles.—Lodge and garage, Cokes Green. Messrs. Forbes & Tate (of London), architects.
Chalfont St. Peter.—Church. Messrs. Brown & Sons.

Stepps.—Double villa, Alexandra Avenue, for Mr. J. Earley.
Troon.—St. Ninian's Episcopal Church (£1,580). Mr. J. A. Morris, F.R.I.B.A. (of Ayr), architect.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 25,219. Nov. 13, 1911. Process for the manufacture of hollow floors and ceilings. Maria Giese, of Bottmuhle 3, Cologne. This invention relates to a process for the manufacture of hollow floors and ceilings, according to which a netting is placed temporarily over bent bars, so that when the floor or ceiling is being constructed it adopts the required shape, and it serves after the setting and tying of the adjacent ends as a plaster support. Thus it is possible to produce the hollows of the floor without using special bodies and, further, to make the plain parts of the ceiling without the use of special plaster supports. Fig. 1 is a longitudinal section showing the manner in which a hollow floor and ceiling are made. Fig. 2 shows the finished floor and ceiling in longitudinal section. Fig. 3 is the bent bar used for producing the cavities. The bent bars, *a*, are placed upon the boards, *g*, of the scaffolding at the places where the hollows of the ceiling are to be situated. The bent bars, *a*, are spaced apart in each row by means of any of the well-known auxiliary devices, whereupon a plank, *d*, is placed upon each row of bars, *a*. These planks can serve as gangways. The wire netting, *b*, is placed over the bars so that it extends from one plank, *d*, to the other, these planks serving as joints between the ends of the several parts of netting, *b*. In order to insulate the netting from the concrete, a layer, *c*, of tarred roofing-felt or the like is placed upon the netting, *b*. The netting can be secured in the concrete at the lowest parts of the ceiling by means of any convenient bondings. The supports or casing being thus completed,

the concrete with the iron reinforcements can be laid, whereupon, after the concrete has set, the scaffolding—that is to say, the boards, *g*, the planks, *d*, and the bent bars, *a*—are removed. The netting *b*, is then pulled down to form one

Fig. 1.

Fig. 2.

Fig. 3.

horizontal plane, fig. 2. The netting, *b*, is tied horizontally, and the ends are connected so that no seams or joints are visible; the netting thus prepared can serve as support for the plaster. The layer, *c*, of insulating material remains adhering to the concrete. October 9, 1912.

PATENT SPECIFICATIONS PUBLISHED
NOVEMBER 7, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 16,304. July 14, 1911.—Date claimed under International Convention, March 8, 1911. Jules Brudenne, 17 rue Planchat, Paris. Manufacture of lead piping.

23,108. Oct. 19, 1911.—F. J. Walton, 10 Woodberry Crescent, Muswell Hill, N., and L. V. Rogers, 115 Valkyre Road, Westcliff-on-Sea. Securing device for doors.

23,138. Oct. 19, 1911.—F. J. Matchette, St. Charles Hotel, Milwaukee, Wisconsin, U.S.A. Vacuum cleaning apparatus.

23,443. Oct. 24, 1911.—E. B. Sanders, 20 Dorset Road, Bexhill-on-Sea. Air inlets for buildings and the like.

23,659. Oct. 26, 1911.—Harry Johnson, 10 Conference Place, Great Thornton Street, and George Paddison, 93 Eton Street, Hessle Road, Kingston-upon-Hull. Kitchen and like fireplaces.

24,124. Oct. 31, 1911.—Date claimed under International Convention, Nov. 4, 1910. J. W. Aylsworth, 223 Midland Avenue, East Orange, Essex, New Jersey, U.S.A. Plastic composition and method of preparing same.

24,187. Nov. 1, 1911.—Alfred Squire, Percy Lodge, Belmont Road, Twickenham. Domestic stoves.

24,481. Nov. 3, 1911.—H. V. R. Read, of the British Fire Appliances Co., Ltd., Craig's Court, Charing Cross, W.C. Apparatus for use in extinguishing fires.

24,546. Nov. 4, 1911.—H. F. Berry, 9 Victoria Street, Westminster, S.W. Heating and drying of stone and other materials for use on roads and like surfaces.

25,517. Nov. 16, 1911.—George Pickles, Mytholm Iron Works, Hebden Bridge, York. Electric-power timber band saw machines.

27,196. Dec. 5, 1911.—John Spencer, Ltd., T. H. Spencer, and H. Spencer Smallman, all of the Globe Tube

Works, Wednesbury, Staffs, and Spencer Horton, 64 Lodge Road, West Bromwich, Staffs. Fire-alarm, &c., valves. 27,866. Dec. 12, 1911.—R. C. Sugg, 10 Thornton Road, Thornton Heath, Surrey. Valves used for the flushing of water-closets.

28,397. Dec. 16, 1911.—T. G. Ellison, 91 Wiverton Road, Sydenham, S.E. Distributing drum or header for heating systems.

19. Jan. 1, 1912.—Walter Jones, Titan Works, Amblescote, Staffs. Sprinklers for sewage and other liquids.

2,534. Jan. 31, 1912.—P. Wenmackers, 26 rue de Belle Vue, Ghent, Belgium. Construction of cement and the like foundations and ground anchorages.

4,152. Feb. 19, 1912.—Henri Gobert, 133 Avenue de Saxe, Lyons, and Paul Meyer, 1 rue Victor Hugo, Lyons. Hot-air distributing apparatus.

16,533. July 15, 1912.—Henry Fowler, The Hollies, Chellaston, near Derby, and W. Chatterton, 15 Wilfred Street, Derby. Fire extinguisher.

18,731. Aug. 15, 1912.—F. D. Jacobs, Canton, Norfolk, Mass. Combined drinking fountains and faucets.

CORRESPONDENCE.

Catalogues Wanted.

383 Calle Suipacha, Buenos Aires,
Octubre 4 de 1912.

MUY SEÑOR MIO,—Nos permitimos dirigirnos a Usted, agradeciéndole muchísimo si pudiera tener a bien de comunicarnos con algunas casas de esa nación a fines que se nos dirijan mandándonos precios y catálogos de máquinas eléctricas para copias de planos, máquinas para secar las copias, papeles técnicos y todas clases de aparatos y novedades referentes a copias de planos, como tambien novedades para arquitectos, constructores e ingenieros.

En espera que este pedido nos será concedido, y que en el próximo correo tendremos alguna correspondencia y que al mismo tiempo disculpará nuestro atrevimiento, aprovechamos la oportunidad para saludarlo atentamente.

“LA FOTO-ARGENTINA.”

NOTA.—Agradeceríamos si la correspondencia fuera en Español o Francés.

Translation.

DEAR SIR,—We should be very much obliged if you would kindly put us into communication with some firms in your country who would be willing to open business relations with us by sending us prices and catalogues of electric machines for copying plans, machines for drying the copies, special papers for same, and all classes of apparatus and novelties referring to the copying of plans, and also other novelties useful for architects, builders, and engineers.

Hoping that you will grant us this favour, and that by the next post we shall have a reply, and also that you will pardon our boldness,—We beg to remain,

“LA FOTO-ARGENTINA.”

N.B.—We should feel obliged if our correspondence can be conducted in Spanish or French.

THE Establishment Committee of the London County Council recommend that tenders should now be invited from selected firms for the construction of the superstructure of the new County Hall.

VARIETIES.

MR. ROBERT ANGELL, architect and surveyor, 133-135 Regent Street, W., has prepared plans for the rebuilding of Nos. 179, 181, 183, and 185 Great Portland Street, W.

MR. H. PAYNE WYATT, architect and surveyor, 18 Angell Road, S.W., has prepared plans for the proposed additional storey at the Bon Marché building, Brixton.

THE Theatres and Music Hall Committee of the London County Council have approved drawings of the following proposed cinematograph halls:—(i.) 516 and 518 Commercial Road; (ii.) 92 to 106 Denmark Hill; (iii.) 192-4 East India Dock Road; (iv.) 194 and 196 Holloway Road; (v.) Queen Street and Bridge Road, Hammersmith; (vi.) 140 Maida Vale.

AN occasional London correspondent sent us a few days ago a letter which we quote, apart from its gratifying opinion of ourselves, as it suggests a practice which might well be followed by others of our readers: “For something like forty-five years have we (my father and I) received *The Architect*. I have for thirty-two years since his death regularly every Sunday afternoon much enjoyed reading its interesting and instructive and, as I do a little private building, useful pages. I have a nephew in Moose Jaw, Sask., a rapidly developing place. I every Friday post it to him, and he appreciates it to the full. He is in the city engineer's office, and all in his department read it, even to the highest officials. . . .”

THE new legislative buildings for the province of Manitoba, as provided for in the plan of Mr. F. W. Simon, architect, of Liverpool, will occupy a commanding position, on a magnificent park-like site at Winnipeg, says a correspondent, of nearly thirty acres on the bank of the Assiniboine river. The cost will be, when completed, \$2,000,000. Sixty-five architects, practising within the British Empire, submitted plans for competition. The main entrance of the building, which is to be in the form of the letter “H,” will face Broadway on the north, but on every side there will be an entrance almost equally imposing, all of which will lead to the grand rotunda in the centre of the pile of buildings. The order used in construction will be Ionic. The approach will be by means of a grand flight of stairs leading to the grand staircase hall on the first floor. The central dome will be one of the most striking features of the building. This will be 240 feet high, resting on huge columns. The new Manitoba parliament buildings, it is said by those competent to express an opinion in the matter, will be the finest legislative building in Canada.

TRADE NOTES.

NOWADAYS, outdoor sports have become so essentially a part of every boy's life that the winter is apt to pall. If they could only rely upon King Frost the difficulty would be overcome, but, unfortunately, “His Majesty” appears to have no special liking for these islands, for his visits are usually few and short. The result often is that boys seek questionable amusements to pass the time, to their own moral undoing and much anxiety to their parents. When considering the question of Christmas presents this year, why not endeavour to solve some part of this problem? For instance, a billiard table in the home will afford hours and hours of pleasure for the boys as well as for the girls and yourself. Billiards is the one game that never becomes monotonous, simply because every game opens up a new phase of its exposition. It is not necessary to have any special room, as tables are made of all sizes. Riley's billiard tables are made for the home on two principles—one to fit your own dining-table and the other a combined dining and billiard table. The Riley “Miniature” is made in sizes from 4 feet 4 inches at £3 7s. 6d. up to 8 feet 4 inches at £10, the popular size being 6 feet 4 inches at £5 5s., and when not in use they can be easily lifted from the dining table and stored against the wall. Riley's combined billiard and dining tables are really handsome pieces of furniture, and can be obtained in woods to match your furniture. By a patent device they can be converted in a few seconds from dining to billiard table, and vice versa. As dining tables there is no indication of their dual purpose, and what is of importance there is plenty of room for the knees. Prices range from £13 10s. Riley's tables are built in exact proportion to the full size, so that the same accurate game is obtained. The cost can be spread over thirteen payments if desired, for 5 per cent. over cash prices, so that they are easily within the reach of the most moderate income. A most interesting catalogue, fully illustrated, can be obtained post free by sending a postcard to E. J. Riley, Ltd., Park Mills, Accrington.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 1s. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

BULGARIA.—Dec. 1.—H.M. Legation at Sofia report that the Ministry of Public Works, Sofia, invite the submission of designs for (1) a new Royal Palace and (2) new law courts. Four prizes are offered in each competition to the value of 10,000 fr. (£400), 7,000 fr. (£280), 4,500 fr. (£180), and 2,500 fr. (£100) in the case of (1); and 6,000 fr. (£240), 4,000 fr. (£160), 2,500 fr. (£100), and 1,250 fr. (£50) in the case of (2). Architects wishing to compete must submit their designs, not later than December 1, to the "Section d'Architecture au Ministère des Travaux Publics," Sofia, where copies of the programmes, &c., may be obtained on request. A copy of the programme (in French) of each competition may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BULGARIA.—Dec. 1.—The Commercial Intelligence Branch of the Board of Trade is in receipt of particulars of a competition of designs for a national library and museum, which it is proposed to erect at Sofia at an estimated cost of 2,000,000 francs (£80,000). Prizes of £160, £100, and £40 are offered. Designs, in sealed envelopes, must reach the "Euphorie-Frères Evloguie et Christo Gueorguieff," Sofia, by Dec. 1. Full particulars can be obtained from the same address. A copy of the programme (in French), together with blue prints, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

CARLISLE.—Dec. 2.—The Local Education Authority for the city of Carlisle having decided to erect new school buildings, caretaker's cottage, &c., on a site off Newtown Road, invite architects practising in Carlisle to submit designs and estimates for the same in competition. A copy of the conditions, instructions, and particulars for competing architects, together with a plan of the site, may be obtained on or after August 1 on application at the office of the City Surveyor, 36 Fisher Street, Carlisle.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

GLASGOW.—Nov. 29.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Battlefield Road and Sinclair Drive, Langside. Premiums of £50, £30, and £25 respectively will be awarded. A plan of the site, along with a copy of the terms and conditions of the competition, may be obtained from Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

CONTRACTS OPEN.

ATHERSTONE.—Nov. 29.—For erection of new post office, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. The Postmaster, Atherstone Post Office, and H.M. Office of Works, &c., Storey's Gate, S.W.

BAKEWELL.—Nov. 30.—For erection of a mortuary in connection with the infirmaries at the workhouse, for the Guardians. The Workhouse Master, Bakewell.

BIRMINGHAM.—Dec. 5.—For the erection of offices and messroom at the Central Station, for the Midland Railway Co. The Engineer's Office, Derby Station.

BLACKWOOD.—Nov. 30.—For five houses and shops at Blackwood, Mon. Mr. R. L. Roberts, M.S.A., Abercarn.

BLANDFORD.—Dec. 7.—For erection of combined yeomanry and infantry headquarters, with sergeant-instructor's house, for the Territorial Force Association of the County of Dorset. Deposit £1 1s. Mr. F. T. Maltby, A.M.I.C.E., architect and surveyor, Dorchester.

BRADFORD.—For the several works required in the alteration and enlargement of the present café and adjoining premises in Tyrrel Street and Bond Street, for Messrs. T. Collinson & Sons, Ltd. Send names to Messrs. W. J. Morley & Son, architects, Swan Arcade, Bradford.

BRUTON.—Dec. 2.—For erection of a public library and caretaker's flat, for the trustees of the Ward Bequest. Deposit £1 1s. Mr. Arthur J. Pictor, A.R.I.B.A., architect, Bruton, Somerset.

CARSHALTON.—Dec. 4.—For the erection of verandahs at the Queen Mary's Hospital, Carshalton, Surrey, for the Metropolitan Asylums Board. Deposit £1. Mr. W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, the Office of the Board, Embankment, E.C.

EGREMONT.—Nov. 26.—For conversion of existing buildings into a Masonic hall, erecting ante-rooms, lavatories, and boundary wall. Mr. J. Cowan, surveyor, &c., Egremont, Cumberland.

FARNHAM.—Nov. 30.—For the following works: (1) erection of cemetery chapel and lodge; (2) iron fencing and gates; (3) forming paths and laying surface-water drains at the Green Lane Cemetery, for the Farnham Joint Burial Committee. Deposit 10s. 6d. for each section. Mr. A. J. Stedman, architect, South Street, Farnham.

FRIZINGHALL.—Dec. 5.—For the erection of timber and corrugated iron awning, offices, latrine, &c., for the Midland Railway Co. The Engineer's Office, Derby Station.

FOLKTON.—Nov. 27.—The Sherburn Rural District Council invite tenders for the following contracts, in connection with the waterworks:—Contract No. 1: The supply and erection of an oil engine in substitution of horse-driven

gear. Contract No. 2: The construction of an engine-house. Mr. W. Plewes, Bridlington Street, Hunmanby.

HALE.—Nov. 28.—For the conversion of the girls' home, Ashley Road, into public offices, for the Urban District Council. Mr. F. H. Brazier, A.R.I.B.A., architect, Bank Chambers, Ashley Road, Hale.

HARROGATE.—Nov. 25.—For the separate trades of mason and bricklayer, carpenter and joiner, plumber and glazier, plasterer, painter, and furnisher, in connection with the erection of entrance lodge and conveniences, Wetherby Lane Cemetery, and additions to Starbeck Baths, for the Corporation. Mr. C. E. Rivers, A.M.I.C.E., borough engineer and surveyor, Harrogate.

HOUSEL BAY.—Nov. 30.—For erection and completion of a residence at Housel Bay, Cornwall. Mr. S. Hill, architect, Green Lane, Redruth.

HULL.—Nov. 27.—For builders' and ferro-concrete work required in the construction of stores and workshop and in alterations to existing buildings at the power station, Osborne Street. The ferro-concrete work is to be carried out by an experienced firm to the city engineer's design. Deposit 10s. Mr. A. E. White, M.Inst.C.E., city engineer, Guildhall, Hull.

HYDE.—Dec. 3.—For extension to the public baths and other works in Union Street. Deposit £2 2s. Mr. J. H. Fletcher, architect and surveyor, 45 Clarendon Place, Hyde.

IRELAND.—For erection and completion of the new church of St. Patrick, Balla. Messrs. Doolin & Butler, architects, Mansion House Chambers, Dublin.

IRELAND.—Nov. 25.—For erection and completion of a pair of semi-detached villas on the Douglas Road, Cork, for Mr. W. G. Wolfe. Mr. J. F. M'Mullen, M.R.I.A.I., architect, 30 South Mall, Cork.

IRELAND.—Dec. 4.—For erection and furnishing of National school buildings at St. Columba's (Ballyheerin), county Donegal. The Office of Public Works, Dublin, and Rathmullen Coastguard Station, county Donegal.

IRELAND.—Dec. 17.—For erection and furnishing of National School Buildings at Kilcoosey, county Leitrim. The Office of Public Works, Dublin, and the Royal Irish Constabulary, Dromahair.

LIVERSEDEGE.—Nov. 27.—For alterations and additions to Millbridge Wesleyan Sunday schools. Mr. J. W. Burrows, architect, Birstall, near Leeds.

LONDON.—Dec. 12.—For alteration and extension of the receiving wards at the workhouse, Swaffield Road, Wandsworth, S.W., for the Guardians of Wandsworth Union. Deposit £2. Mr. F. W. Piper, clerk, Union Offices, St. John's Hill, Wandsworth, S.W.

LOSTWITHIEL.—Dec. 3.—For erection of a drill hall, for the Cornwall County Territorial Force Association. Mr. O. R. Caldwell, architect, Penzance.

LUDDENDENFOOT.—Dec. 6.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with special subjects centre alterations at Luddendenfoot Council School—viz. builder, joiner, plasterer, and painter. The Education Architect, County Hall, Wakefield.

SCHOOL PLAYGROUNDS.

THE Board of Education have issued the report of the Departmental Committee which inquired into the question of playground accommodation for public elementary schools. The report gives the history of the provision of playgrounds, and shows that the object was to enable children to have suitable recreation and physical exercise. The Committee are of opinion that a field or park was more suitable than a playground for the organisation of games, but, unfortunately, the provision made in fields and parks was at present lamentably deficient. The Committee therefore express the opinion that when new schools are being planned every effort should be made to secure facilities for games on a much more abundant scale than has been the case in the past. The Committee's main recommendations are as follows:—

NEW SCHOOLS.

1. That the shape of the playgrounds should be more carefully scrutinised, and that passages, fore-courts, &c., should not be counted as forming part of the minimum space required.

2. (a) That except in very small schools playgrounds should be separate for boys and girls. (b) That the playgrounds for girls and infants need not be separated. (c) That where girls and infants use the same playground the area must be sufficient for the total number of children, calculated in accordance with the following recommendations.

3. That where other provision is made for games:—
(a) Each undivided playground for 200 children and upwards should provide—(i) 20 square feet for each older child; (ii) 16 square feet for each infant. (b) Each undivided playground for less than 200 children should provide 2,000 square feet, together with—(i) 10 square feet for each older child; (ii) 6 square feet for each infant.

4. That where no other provision is made for games:—
(a) Each undivided playground for 200 children and upwards should provide—(i) 30 square feet for each older child; (ii) 16 square feet for each infant. (b) Each undivided playground for less than 200 children should provide 2,000 square

feet, together with—(i) 20 square feet for each older child; (ii) 6 square feet for each infant.

5. That—(a) Where a site is expensive (regard being had to the price of land and resources of the authority) the Board may accept a playground below the measurements specified in section IV. (a) and (b) above. (b) The precise degree of reduction from this standard shall be decided on the merits of each case, but in no case shall the reduction bring the playground below the measurements specified in section III. (a) and (b).

EXISTING SCHOOLS.

6. Every school should have space for each class to take its lessons in physical exercises in the playground or an equivalent space.

7. After 1920 a playground allowing less than 10 square feet for each child should be classed as "insufficient."

8. After 1925 a playground allowing less than 15 square feet for each child should be classed as "insufficient."

9. Enlargements of buildings should not, except in unusual circumstances, be allowed if it would result in a reduction of the playground below the limits specified in sections III. and IV. Reduction of playground below these limits by the erection of buildings for special subjects should not be allowed.

GENERAL.

10. A roof playground should be accepted, and if it covers virtually the whole of the building should be regarded as satisfying the requirements of the children, other than infants, occupying one floor.

ST. ANDREW'S (R.C.) HOSPITAL, DOLLIS HILL LANE, N.W.

So far, the Metropolis has had the benefit of but one Roman Catholic hospital—that of SS. John and Elizabeth in St. John's Wood. With the increasing home membership of the old faith and with an increasing influx from abroad, the need of an additional institution to cope with sickness and disease becomes manifest.

It is one of the pleasant qualities of humanity that this need ever finds its benefactor; in the present instance the community owes it to an anonymous lady donor that this fine institution of St. Andrew's Hospital has risen from the soil in North-West London. A very capable architect has been secured in the person of Mr. R. L. Curtis, F.S.I., the contractors for the work (costing some £40,000) being Messrs. Patman & Fotheringham.

It is about three years since operations on the site were commenced, but the actual setting-out of the hospital block dates back only twenty months, and it is anticipated that patients will be admitted about or shortly after Christmas. With Portland stone facing for the centre and with Mr. Mark Gentry's red bricks for general facings, the quiet Renaissance elevations present a very pleasing appearance. Delabole slates are used for the roof coverings, the dome over the chapel being supplied with copper by the well-known firm of Ewart. At present only the central (administrative) block and the right (east) wing are erected. The wards themselves are on two floors consisting of public, private, and (in a separate pavilion) isolation wards, the latter for patients detected or suspected as being infectious subsequent to admission, for the hospital is merely for general medical and surgical cases.

In a technical paper, such as *The Architect*, it is unnecessary to describe the accommodation and lay-out of a hospital (cottage, as in this case, or otherwise); it suffices to say that everything is up to date and has been well thought out. When we recognise that Messrs. Dent & Hellyer supplied the sanitary fittings (other than the baths, which were obtained from Messrs. Shanks), the Art Pavements Decoration Company being responsible for the terrazzo mosaic, the electric lifts being by Messrs. Waygood, wrought ironwork and railings by Messrs. Bayliss, Jones & Bayliss, and oak fencing by Messrs. E. C. White & Son, we may assume that satisfaction is likely to ensue. If we are to criticize at all, we would express surprise that in fitting all the windows for reversible treatment some system was not employed where loose parts do not form an integral feature. The "N.A.P." fittings are well known, it is true, but they are not as good as some known to us where there are no loose parts liable to be lost; however, we do not grudge Messrs. Lockerbie & Wilkinson the extensive order entailed. The ferro-concrete floors and stairs are the work of the Cubitt Concrete Construction Company. The heating

and hydrants (of which there are twelve installed) are the work of Messrs. Jeffreys & Co., Ltd.

For the hall and staircase a terrazzo dado has been employed, and this material is largely used for the flooring. The complete provision of electric lighting and telephones is the work of Messrs. Bakewell & Son.

The operating theatre is being fitted up with elbow-action lavatories, glass shelves, and all requisite conveniences. The system for ventilating the theatre is noteworthy, fresh air cleaned and warmed being admitted up a large duct and drawn across the theatre by the action of an exhaust fan, placed so that there shall be a thorough and continuous change of air. The neat ironmongery is supplied by Messrs. Colledge & Bridgen.

A pleasant feature in the hospital is the chapel, with its reinforced columns and beams; it is effective both within and without. The altar table has been transferred from the Convent of the Holy Rood, Regent's Park. Adjoining the chapel is a confessional and a sacristy; the chaplain's house is at the entrance of the grounds.

The walls of the sisters' and nurses' day and bedrooms, the wards, and other parts (in three-coat lime and hair, and with dadoes in Keene's cement) are all very quietly but cheerfully decorated in tones of distemper, which will eventually be replaced by enamel paint such as is used for the joinery in general. Offices have the walls lined with white glazed tiles.

All corners throughout are rounded, and there is a general appearance of germ resistance that is very satisfying to the sanitarian, except as regards the use of false ceilings below the flat covering the isolation pavilion.

The water-storage capacity in cisterns is 2,400 gallons, besides the provision of compensating tanks. The buildings are protected against the ravages of lightning by conductors supplied by Messrs. Ewart & Son.

The wards are heated by the well-known open-fire stoves with horizontal subfloor flues, and the stoves in general throughout the buildings are supplied by the Teale Fireplace Company. It would seem almost worth while to be ill, when one is a Roman Catholic of the Metropolis, if it connotes being a patient in such a hospital as the one described.

GLASGOW BUILDING TRADES EMPLOYERS' COUNCIL.

A MEETING of the Glasgow and West of Scotland Building Trades Employers' Council was held on the 18th inst. in the secretary's office, 204 St. Vincent Street, Glasgow. Mr. William H. Baxter, Chairman of the Council, occupied the chair. The Secretary reported regarding the negotiations which had passed since last meeting with the Institute of Measurers as to the alterations on the conditions of building contracts. The report was to the effect that, with the exception of one of the conditions, the Institute of Measurers had agreed to the conditions submitted by the Council. After some discussion, it was agreed to submit an amended proposal to the Institute of Measurers in lieu of the condition objected to by them. A report was submitted from several of the affiliated associations regarding the proposal made by the Board of Trade under the National Insurance Act, in virtue of which the Board of Trade would undertake on behalf of the employers the custody, stamping, distribution, and exchanging of contribution cards and unemployment books. After consideration it was agreed in the meantime not to adopt the proposal of the Board of Trade, as the Council were of opinion that the arrangements at present in force had not had a fair trial. The Secretary, in referring to a communication sent to the Town Clerk strongly opposing the Corporation adopting the single-contractor method of executing the addition to the Municipal Buildings, explained that he had received a letter from the Town Clerk stating that the matter would be brought before the Buildings Committee when the question of preparing the necessary specifications and schedules came to be considered. A proposal to have a meeting of the members of the various associations affiliated with the Council was discussed, and it was agreed that a meeting should be held in February, at which the annual report of the Council would be submitted for consideration and any matters of general interest to the building trade brought up for discussion.

THE Worcester City Council are about to apply for a loan of £7,400 to carry out the extension of the boiler-house in Hylton Road, together with the supply of new plant.

The late Mr. NORMAN SHAW, R.A. For obituary notice, see p. 305. Reduction of a cartoon in *The Architect*, July 18, 1909.

THE BRITISH FIRE PREVENTION COMMITTEE.

THE British Fire Prevention Committee has strengthened its Council, the various vacancies being influentially filled. According to the result of the postal ballot, which has just been announced, Lord Montagu of Beaulieu, J.P., V.D., D.L., will take the place of the late Major-General Festing, C.B., F.R.S.; Sir Aston Webb, C.V.O., C.B., R.A., will take the place of Sir John Taylor, K.C.B., deceased (formerly principal architect of H.M. Office of Works); Sir Maurice Fitzmaurice, C.M.G., M.Inst.C.E., Chief Engineer, London County Council, will replace Mr. Alexander Ross, M.Inst.C.E., retired; Mr. W. Slingo, Engineer-in-Chief, General Post Office, will replace Mr. E. G. Rivers, I.S.O., late Chief Engineer, H.M. Office of Works, retired; and Mr. Hippolyte J. Blanc, R.S.A., F.R.I.B.A., will replace Mr. Spencer Harty, M.Inst.C.E., who has recently retired from the Dublin Corporation Surveyorship.

Of the members of Council well known in the architectural and engineering professions re-elected to the Council are Sir W. Henry Preece, K.C.B., F.R.S., Sir Henry Tanner, C.B., I.S.O. (Principal Architect to H.M. Office of Works), Sir Arthur Whitelegge, K.C.B., Major Cooper-Key (Chief Inspector Explosives), and Mr. R. A. Redmayne, C.B., M.Sc. (Chief Inspector of Mines), of the Home Office, Colonel Sir Edward Raban, K.C.B., R.E., of the Admiralty, Sir Boverton Redwood, Bart., D.Sc., Major W. O'Meara, C.M.G. (General Post Office), Sir James Szlumper,

M.Inst.C.E., Mr. Alexander Siemens, M.Inst.C.E., Mr. W. H. Hunter, M.Inst.C.E., Sir Douglas Fox, J.P., M.Inst.C.E., Sir Henry Trueman Wood, M.A., of the Royal Society of Arts; whilst amongst those closely connected with the fire service are the Earl of Lonsborough, K.C.V.O., and Rear-Admiral J. de C. Hamilton, M.V.O. (late London Fire Brigade).

The Executive as re-elected includes, among others, Mr. Edwin O. Sachs, F.R.S.Ed., as Chairman; Mr. Horace S. Folker, F.A.I., as Honorary Treasurer; Mr. Ellis Marsland, as General Honorary Secretary; Mr. J. W. Restler, M.Inst.C.E. (of the Metropolitan Water Board); Hon. Chief Officer J. Herbert Dyer, Mr. Max Clarke, F.R.I.B.A., and Mr. Percy Collins, J.P.

The various standing sub-committees have been augmented, and include a number of well-known fire brigade officers, both professional and volunteer.

The opportunity is taken to remind those interested that the British Fire Prevention Committee was formally founded on November 20, 1897, the day of the Cripplegate fire, and has thus just completed its fifteenth year.

THE Birr No. 1 Council (Ireland) have adopted a town-planning scheme for the rural towns and villages of the Union. It is proposed to build 234 cottages on the plan of those which have been erected at Roscrea.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

CHESHIRE.

Helsby.—Two villas, Youd's Lane, for Mr. Calvey.
Macclesfield.—Guardians' Nurses' Home. Mr. J. Clayton, contractor.
Sale.—Council School for 300 places, Ashton-upon-Mersey (£6,500).

CORNWALL.

St. Austell.—Training College.

CUMBERLAND.

Cummersdale.—Printing works: additions for Messrs. Stead & McAlpine.

DERBYSHIRE.

Gresley.—House and shop, York Road, for Mr. J. J. Norton.
Parwich.—Six working-class dwellings (£1,000).
Woodville.—Six houses, Swadlincote Road, for Mr. J. Godfrey.

DEVON.

Exeter.—Royal West of England Deaf and Dumb Institution: additions and alterations. Mr. J. Jerman, F.R.I.B.A., architect.
Torquay.—Hotel, shops, &c., Babbacombe. Mr. F. G. Moore, architect.

ESSEX.

Grays.—Church, East Thurrock Road and Arthur Street. Hospital pavilion and porter's cottage. Mr. C. M. Shiner, A.R.I.B.A. (of London), architect.
Southend-on-Sea.—Four houses, Marguerite Drive, for Mr. A. J. Lucking.
Two houses, Thorpe Bay Gardens, for Mr. C. Matthews.
Two houses, Lonsdale Road, for Mr. C. T. Standen.
Two houses, Tyrone Road, for Messrs. J. Warren & Co.
Three houses, Upper Whitegate Road, for Mr. E. A. Cave.
Fourteen houses, Victoria Road, for Mr. G. Pedwell, junr.
Motor garage, Clarence Road, for Mr. F. Webster.
West Ham.—"The Cedars," Portway: additions and alterations for County Territorial Force Association.

HAMPSHIRE.

Portsmouth.—Portsmouth and South Hants Eye and Ear Infirmary: extensions.

HERTFORDSHIRE.

Bushey.—Banking premises, High Street. Mr. A. C. Blomfield, F.R.I.B.A. (of London), architect.
Haileybury.—College: additions. Messrs. Simpson & Ayrton, R.R.I.B.A. (of London), architects.

LANCASHIRE.

Dalton-in-Furness.—Cinematograph Theatre, for the Backhouse Drinkwater Picture Palaces, Ltd.

LEICESTERSHIRE.

Leicester.—St. Andrew's Church schools: enlargement.

LINCOLNSHIRE.

Bourne.—Workhouse isolation hospital (£4,350) and pavilion (£300).
Lincoln.—Public Library. Messrs. W. Wright & Son, contractors.

MIDDLESEX.

Ealing.—Cinematograph Theatre (for 1,200 sittings), Northfield Lane (£3,500). Mr. G. P. Pratt, A.R.I.B.A. (of Acton), architect.
Wesleyan Church, &c., Lindfield Road, Brentham (£2,800). Mr. J. W. Bateson, A.R.I.B.A. (of London), architect. Messrs. J. Smith & Sons (of Norwood), contractors.
Pinner.—"Landards," Royston Park: additions for Mr. H. R. Arnold.

NORTHAMPTONSHIRE.

Northampton.—Girls' Secondary School. Messrs. Pullen, contractors (£16,655).
Thirty-six workmen's houses, Kingsthorpe.

NOTTINGHAMSHIRE.

Sutton-in-Ashfield.—Fire station. Council surveyor.

STAFFORDSHIRE.

Burslem.—Police station.
Cheadle.—Court House (£3,000).

Cheddleton.—Lunatic asylum: Nurses' Home.

Fenton.—Police station

Tunstall.—Business premises, Station Road. Messrs. Watkin & Adams (of Stoke), architects.

Wolverhampton.—District and Staffordshire General Hospital: reconstruction and extension (£54,100).

SURREY.

Barnes.—Additions to "Hindley," Christ Church Road, for Mr. R. B. Rowell.

Four houses, Lower Richmond Road, for Mr. G. W. F. Bates.

House, Madrid Road, for Mr. A. Harvey.

Five houses, Melville Road, for Mr. C. J. Kerven.

Additions to "Queensmead," Sheen Road, for Mr. S. Hutchins.

Alterations to "The Grange," Stonehill Road, for Messrs. Roberts & Co., Ltd.

Godalming.—Church Room (£1,500).

Mortlake.—"The Two Brewers," High Street, additions and alterations, for Messrs. Watney, Combe, Reid & Co.

Richmond.—No. 8 Perseverance Place: rebuilding. Mr. T. W. Aldwinckle, F.R.I.B.A. (of London), architect.

No. 1 Albert Road: alterations for Messrs. Drew & Son.

No. 99 Kew Road: additions and alterations. Messrs. Brewer, Smith & Brewer, architects.

Sutton.—Girls' County School.

Secondary School.

Woking.—Technical Institute and Secondary School.

SUSSEX.

Brighton.—Y.M.C.A. premises, Steine House: extensions (£5,000).

Cuckfield.—Workmen's dwellings.

Wivelsfield.—Reading-room.

WARWICKSHIRE.

Birmingham.—Warehouse, &c. Messrs. Riley & Smith, architects.

WORCESTERSHIRE.

Bromsgrove.—District Council stabling, stores, &c. (£1,690).

Droitwich.—Workmen's houses.

King's Heath.—Monyhull Colony: extensions. Messrs. C. Whitwell & Son (of Birmingham), architects.

Redditch.—Cinematograph Theatre, Alcester Street, for Mr. C. H. Baines (of London).

Wolverley.—Council School.

Worcester.—Electricity Department: extension of boiler house, Hylton Road (£1,200). City Engineer.

YORKSHIRE.

Alne.—Wesleyan Sunday school (£500).

Carlton and Faceby.—Council School.

Goole.—Town Hall (£7,650).

Salisbury-by-the-Sea.—Council School: extension. Mr. J. Hutton, contractor (£515).

Sheffield.—Wesleyan school, Ellesmere Road (£2,500).

Thirsk.—Secondary school for 100 places.

Wombwell.—Parish Church completion.

Yarm.—Grammar school. Messrs. E. Dobson & Son (of Stokesley), contractors (£3,187).

WALES.

Blaenrhondda.—Branch Institute for the Fernhill and Blaenrhondda workmen. Mr. W. D. Morgan (of Penre), architect.

Ely.—Workhouse: engine house. Mr. E. Seward, F.R.I.B.A. (of Cardiff), architect.

Rhondda.—Council offices.

SCOTLAND.

Ayr.—Parish Church Hall extension, Wallacetown.

Cathcart.—Double villa: Old Cathcart Road, for Mr. Stephen Mitchell (of Glasgow and Kippen).

Clarkston.—Two double cottages, Overlee, for Messrs. J. & R. C. Merry.

Clydebank.—Fire station and copper store, for Messrs. John Brown & Co.

Dundee.—Semi-detached cottages, Bank Avenue, for Mr. C. Gray.

Semi-detached cottages, Fingask Street, for Messrs. J. Foggie & Son.

Edinburgh.—Labour Exchange, Lauriston Place, Tollcross (£8,000). H.M. Office of Works.

Gartcosh.—Board school (£6,400).

Giffnock.—Double villa, Eastwood Avenue, for Messrs. G. Dixon & Sons.

SCOTLAND—continued.

Glasgow.—Veterinary College, Buccleuch Street: alterations (£2,300).

Buildings, Hydepark Street, for Messrs. Bilsland Bros.

Works, Paton Street, Dennistown, for Messrs. J. Wallace & Sons, Ltd. (£20,000).

Four double villas, Mount Annan Drive, Mount Florida. Messrs. Sproul & Sons (of Cambuslang), builders.

Three houses, Netheraton Road, Mount Florida. Mr. R. Henderson (of Glasgow), architect.

Five terrace houses, Mossgiel Road, Newlands, for Messrs. G. Eadie & Sons.

Works, Harvey Street, Yoker: additions for Messrs. Halley's Industrial Motors, Ltd.

Paisley.—Double villa, Arkleston Road, for Mr. A. M'Kechnie.

Nos. 138 and 139 Causeyside: additions and alterations for the Provident Co-operative Society.

Works, Lonend: reconstruction for Gleniffer Soap Co.

Portobello.—Twelve cottages, Westbank Place, for Mr. W. Anderson.

IRELAND.

Moneygall.—Fourteen cottages under town planning scheme; also at

Shinrone.—Twenty cottages.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 20,202. Sept. 12, 1911.—Improvements in wall construction for houses and other buildings. J. W. Moseley, Pennine Edge, Hill Top, Romiley, Cheshire. This invention relates to improvements in the construction of walls for

Fig. 2.

Fig. 1.

Fig. 3.

architectural works, the object being to provide an improved method of construction applicable to ferro-concrete or concrete. Hollow concrete troughs are laid in courses and end to end, like ordinary masonry, and when filled with concrete a monolithic structure is secured, and the troughs remain in the wall, and form the facing thereof. The troughs have two sides, connected at the ends with strong webs designed to support the sides, enabling them to resist lateral stresses caused by the filling and tamping of the wet concrete and expansion when setting. These webs are also designed to allow a large core opening (half the depth of the trough at the lowest point) for the concrete filling to pass over the joints and clamp the ends of the troughs together when laid end to end. Metal ties further strengthen the joints, and also horizontal and lateral rods to connect the sides and ends of troughs to the bottom. Fig. 1 is a longitudinal section of

a wall or portion of a wall. Fig. 2 an end elevation of same partly in section. Fig. 3 a perspective view of a portion of a wall showing two of the troughs broken or cut through, one longitudinally and the other laterally. *a* indicates a number of hollow troughs open at the top, the sides connected with webbed ends designed with core opening, *b*, and the bottoms are open and strengthened with longitudinal and transverse rods, *c*. The metal ties, *d*, are used to further strengthen the joints when required. Sept. 18, 1912.

PATENT SPECIFICATIONS PUBLISHED
NOVEMBER 14, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 14,986. Dec. 27, 1911.—S. E. Spencer, 21 Blakesley Avenue, Ealing, W. Fastening for windows.

21,011. Sept. 22, 1911.—William Thompson, 54 Duke Street, Birkenhead. Manufacture of pressed or stamped metal panels.

23,266. Oct. 21, 1911.—Date claimed under International Convention, Feb. 21, 1911. A. Muggia, 135 Via Giovanni Lanza, Rome. Production of mosaics.

23,342. Oct. 23, 1911.—T. A. Watson, Bosigran, Whytecliff Road, Purley. Hollow piles.

23,403. Oct. 24, 1911.—Percy Higson, 42 Spring Gardens, Manchester, and Thos. Hughes, 7 Stanley Street, Salford. Fire-resisting doors and automatic fire extinguishing apparatus.

24,074. Oct. 31, 1911.—David Baxter, Inveresk, Crompton Avenue, Cathcart, and R. L. Baxter, 150 Bothwell Street, Glasgow. Treads for stairs, steps, and other surfaces.

24,445. Nov. 3, 1911.—A. P. Nichols, 130 25th Avenue North, Seattle, King, Washington, U.S.A. Electric water heaters.

24,832. Nov. 8, 1911.—James Howorth & Co., Ltd., and F. C. Howorth, Victoria Works, Farnworth, Lancs. Dust collectors and air filters.

27,479. April 3, 1912.—Alexander Struthers, 2 Alfriston Road, Clapham Common, West Side, S.W. Window sashes.

28,503. Dec. 18, 1911.—Pigments, Ltd., and W. P. Thompson, 6 Lord Street, Liverpool. Lead pigments.

1,638. Jan. 20, 1912.—C. T. Cuss, 25 Evelyn Street, Swindon, Wilts. Fire extinguishers.

1,997. Jan. 25, 1912.—F. R. Stone, 1 Clift Road, Ashton Gate, Bristol. Device for securing corrugated sheets to roofs.

2,764. Feb. 2, 1912.—H. S. Martin, 8 Rock Park, Rock Ferry, Chester. Electrical heating and radiating apparatus.

3,088. Feb. 7, 1912.—Herbert Clarke, 74 Pinnox Street, Tunstall, Staffs. Dies for tile and like presses.

3,276. Feb. 9, 1912.—Alfred Browning, Halesowen Road, Old Hill, Staffs., and Harry Tott, 81 High Street, Ponder's End. Sewage distributors.

4,233. Feb. 20, 1912.—Date claimed under Convention, Sept. 11, 1911.—H. L. C. Neuilly, 8 Rue Nouvelle, Boulevard de l'Hopital, Paris. Electro-magnetic device for warning against theft and burglary.

5,745. March 7, 1912.—P. D. Beard, 49 Church Street, Bridgwater, Somerset. Drawer-fitting and various sand-papery machines for cabinet-making and the like.

6,597. March 16, 1912.—Date claimed under International Convention, July 25, 1911. Max Binetter, Kismanya, Hungary. Manufacture of artificial stone by a cold method.

6,953. March 21, 1912.—Joseph Southall, Enderlie, Selbourne Road, Worcester. Heating stoves.

12,063 and 12,064. May 21, 1912.—E. Le Bas and H. T. Garvie, Dock House, Billiter Street. Sheet-metal piling.

13,784. June 12, 1912.—Date claimed under International Convention, June 14, 1911. J. & C. G. Bolinders Mekaniska Verkstads Aktiebolag, 10 Kaplansbacken, Stockholm. Cutters for tonguing wood.

14,084. June 17, 1912.—Michael Cushion and J. Lyons & Co., Ltd., Cadby Hall, Hammersmith Broadway, W. Taps or cocks.

17,861. Aug. 1, 1912.—D. N. Alexeeff, 14 Krasnoprudnaja Street, Moscow. Making and placing concrete piles.

18,667. Aug. 14, 1912.—Paul Hellmuth and P. J. Becker, Gerolstein, Germany. Apparatus for use in cutting sheets of glass.

A FACULTY has been granted by the Carlisle Consistory Court for the proposed enlargement of the parish church of St. James's, Arnside, at a cost of about £2,000. The architects are Messrs. Austin & Paley, of Lancaster.

FIRE ESCAPE EXITS.

RECENT fatal fires have demonstrated the disadvantage of being unprepared with two means of escape, so that one is available in the event of the other being blocked with smoke or flame, and in this concern our advertisement pages have drawn attention to the invention of Mr. Heathman, of Parson's Green, Fulham, who makes and fixes an excellent system of lever attachments to ladders, so that as the ladder is folded up to lie flat under the ceiling it closes and holds the roof trapdoor secure against wind, rain, and burglars, while in lowering the ladder for service the trapdoor automatically and fully opens by the counterweight of the ladder. Some hundreds have been fixed by Heathman & Co., and timely provision may give security to persons in buildings of every character.

HAMPSHIRE AND ISLE OF WIGHT ASSOCIATION OF ARCHITECTS.

A MEETING of the Hampshire and Isle of Wight Association of Architects was held at Winchester Castle on Tuesday, Sir William Portal, Bart., F.S.A., presiding. Twenty-five new members were elected, and arrangements for meetings at Portsmouth (December 17), Bournemouth (January), and Southampton (February) were discussed. After viewing, at the President's suggestion, the ancient sally-port of the Castle, the party proceeded to the cathedral, where they were met by Mr. T. G. Jackson, R.A., who conducted them round the building, inside and out, and returned with them to the Castle. An address on the objects of the Association by the President was followed by one by Mr. Jackson on the work at the cathedral, and in the course of discussion the parlous condition of St. Sophia was described. The Association, although only founded this year, has already a representative membership in the county, Southampton alone having sixteen members.

VARIETIES.

THE Doncaster Corporation at their last meeting decided to apply to the Local Government Board for sanction to borrow £28,895 for the erection of sixty houses at Balby and sixty-four houses in Carr House Road. The tender of Mr. A. Thompson, amounting to £25,897, has been conditionally accepted.

MR. H. HOWARD HUMPHREYS, M.Inst.C.E., Westminster, has prepared a sewerage scheme for the combined parishes of Crowthorne and Sandhurst. The estimate for the scheme is £55,273, which will include sewers 26.36 miles, manholes, &c., £33,356; pumping plants, engine houses for Crowthorne £1,650, and Sandhurst £2,800 respectively; purification works, £8,000.

THE bricklayers, carpenters, and labourers in the building trade at Dudley have approached their employers with a view to securing advances in wages. The bricklayers and carpenters ask for an increase of a halfpenny per hour and the labourers a penny per hour. It is five years since the last advances were conceded, and the men point out that in the meantime the cost of living has considerably increased.

At the monthly meeting of the Lancashire Education Committee attention was called to a tender amounting to £5,252 for the erection of a new school at Waterloo (Ashton-under-Lyne). A member pointed out that the Local Area Committee did not recommend its acceptance, but one sent in by a local firm, which was £2 12s. 6d. more. The County Committee, however, having invariably acted on the principle that if the contractor who gave the lowest tender was satisfactory it should be accepted, whether he was a local man or not, now recommended the acceptance of the £5,252 tender. This proposal was agreed to on Monday last.

We regret to announce the death of Mr. Charles D. Phillips, J.P., the proprietor of the Emlyn Engineering Works, Newport, Mon., and of "Phillips' Monthly Engineering Register." The large business which Mr. Phillips founded and successfully carried on for over forty years will be continued in the same manner under the joint management of his eldest son, Mr. C. Godfrey Phillips, and of Mr. T. Morris Prosser (who has been with the firm for more than thirty years). In the building trades the name of Mr. Charles D. Phillips is well known as the inventor of the "Lock-Jaw Tile."

It is announced by the Trade Union Congress Parliamentary Committee in regard to the recent ballot on the question of the amalgamation of the building trade unions

that any of the societies which did not take part in the recent vote may send delegates to the adjourned conference in December, provided that their members have been balloted for in the meantime. In the recent voting, out of 117,370 papers supplied, only 43,697 were used, leaving 73,673 not accounted for. The requisite two-thirds majority was not obtained. It is now proposed that a central fighting fund might be established, to be controlled by an executive committee representative of the subscribing societies, leaving complete autonomy to each union as far as its friendly benefits are concerned.

OUR contemporary the *Electrical Review* has just been celebrating its fortieth birthday. On November 15, 1872, its first modest issue appeared. Since that time it has grown and prospered like the industry it represents. Instead of a small monthly pioneer pamphlet, it is now a vigorous weekly paper, with about three times the amount of editorial matter and over ten times the number of advertisement pages. An appreciative article is contributed by Sir William H. Preece, K.C.B., F.R.S., whose electrical career began in 1852, and who has known the publication since its inauguration, and for a short time edited it. Sir William Preece says: "The life of the *Electrical Review* is a history of the life of the electrical industry."

TRADE NOTES.

A LARGE clock with peal of eight bells has just been erected in Brilley Church, Herefordshire. The clock has been fitted with the latest improvements and made by Messrs. John Smith & Sons, Midland Clock Works, Derby. The bells were cast by Messrs. Mears & Stainbank, London.

THE Imperial Trade Correspondent at Toronto, Canada (Mr. F. W. Field) has forwarded to the *Board of Trade Journal* an extract from the local press containing a description of the proposed municipal abattoir at Toronto. According to this description, the building is to be absolutely fireproof and sanitary; glazed bricks and tiles will enter very largely into its construction, whilst vitrified bricks will be used for the floors. The name and address of the United States firm of architects who have prepared the plans, &c., for the building may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

A CHIME of eight bells, weighing 53 cwt., is to be erected at Duncricht House, near Aberdeen, the seat of Lord and Lady Cowdray, by Messrs. John Warner & Sons, of "The Spitalfields Foundry," London, E.C., at a total cost of £1,000. The bells are to be operated by the firm's patent electrical apparatus, which combines a mechanical device for tune-playing with a clavier or keyboard to be operated by hand. The carillon will be worked from the electric lighting mains. These bells are a great boon for small churches where it is impossible to erect a ringing bell, and also for schools and public buildings.

THE Invincible Talbot Company celebrated the conclusion of the Olympia Motor Show on Saturday by an attack upon the records at Brooklands. The car, which was a 25 h.p., with the ordinary standard engine catalogued and supplied by Messrs. Clement Talbot, Ltd., first of all put up the terrific speed of 113.28 miles per hour. The flying kilometer was done at 112.81, the mile at 111.73 miles per hour, while her fastest lap (about three miles) was completed at 109.43 miles per hour. When, at the finish, the driver cut off his power the car ran with her own velocity a distance of nearly two miles. The previous record for four-inch engines was beaten by no less than 26 miles per hour, and with the exception of a 200-h.p. Benz, the 25-h.p. Talbot on Saturday secured the record of being the fastest car that has ever travelled on the Brooklands track.

A SMALL preliminary catalogue has been sent to us showing the Bayard cars, of which the sole concessionaires for A. Clement-Bayard, Paris, are Bayard Cars, Ltd., of 98 High Street, Marylebone, W. The first car illustrated and described is an 8-h.p. four-cylinder Bayard, which may be purchased, fitted with a two-seater torpedo body, for the low price of £197. Next comes a 10-h.p. four-cylinder car, which is sold for £241 if fitted with a four-seater torpedo body. The biggest and most expensive car in the catalogue is a 14-h.p. car. The price of the chassis is £308, and, if fitted with a torpedo body, £380. The cars seem of compact design. The French firm have appropriated that fine motto, "Sans peur et sans reproche."

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 p.m. on Thursdays.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 1s. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Cradock Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

CONTRACTS OPEN.

ALPHINGTON.—Dec. 4.—For erection of a house at Alphonington, near Exeter. Deposit £3. Messrs. E. H. Harbottle & Son, architects, County Chambers, Exeter.

BIRKENHEAD.—Dec. 3.—For plastering, &c., of dayrooms, dormitories, &c., on the female side of the main building of the workhouse, Tranmere. The Poor-Law Offices, Birkenhead.

BIRMINGHAM.—Dec. 5.—For the erection of offices and messroom at the Central Station, for the Midland Railway Co. The Engineer's Office, Derby Station.

BLANDFORD.—Dec. 7.—For erection of combined yeomanry and infantry headquarters, with sergeant-instructor's house, for the Territorial Force Association of the County of Dorset. Deposit £1 1s. Mr. F. T. Maltby, A.M.I.C.E., architect and surveyor, Dorchester.

CARSHALTON.—Dec. 4.—For the erection of verandahs at the Queen Mary's Hospital, Carshalton, Surrey, for the Metropolitan Asylums Board. Deposit £1. Mr. W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, the Office of the Board, Embankment, E.C.

CAMBORNE.—Dec. 7.—For erection and completion of a residence. Mr. S. Hill, architect, Green Lane, Redruth.

DOVER.—Dec. 14.—For additions and alterations to the girls' department of St. Martin's Council School at Markland Road, for the Town Council. Deposit £2 2s. Mr. W. C. Hawke, A.M.I.C.E., borough engineer, Maison Dieu House, Biggin Street, Dover.

HEREFORD.—Dec. 10.—For erection of a grain shed, offices, &c., for the Great Western Railway Co. The Engineer at Gloucester Station.

HUDDERSFIELD.—Dec. 4.—For erection of additions and alterations to Primrose Hill Working Men's Club. Messrs. J. Berry & Sons, architects and surveyors, 3 Market Place, Huddersfield.

IRELAND.—Dec. 3.—The Pembroke Urban District Council are prepared to consider tenders for the construction of a refuse destructor at their electricity works, South Lotts Road. Charge 5s. The Town Hall, Ballsbridge, County Dublin.

IRELAND.—Dec. 12.—For building twenty-two single and eighteen double cottages for labourers, and fencing fifty-eight plots, for the Dungannon Rural District Council. Charge 5s. The Clerk to the Rural District Council, Dungannon.

IRELAND.—Dec. 17.—For erection and furnishing of National School Buildings at Kilcoosey, county Leitrim. The Office of Public Works, Dublin, and the Royal Irish Constabulary, Dromahair.

IRELAND.—Dec. 20.—Tenders for erection and furnishing of National school buildings at Milltownpass, county Westmeath. The Office of Public Works, Dublin, and the Royal Irish Constabulary Barracks, Rochfort Bridge.

LEEDS.—Dec. 2.—For the whole or any portion of the works required in erection of business premises, New York Street, for Messrs. C. A. Wilkinson & Co. Forward names and trades by Dec. 2 to Mr. W. M. Coggill, architect, 4 Aire-dale Terrace, Stourton, Leeds.

LEICESTER.—Dec. 3.—For alterations and extension to Leicester labour exchange, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. The Manager, Leicester Labour Exchange, and H.M. Office of Works, &c., Storey's Gate, S.W.

LONDON.—Dec. 3.—For the taking down and replacing a new ceiling in D ward of the Bromley Asylum, for the Managers of the Poplar and Stepney Sick Asylum District. Deposit £1 1s. Messrs. J. & W. Clarkson, architects, 136 High Street, Poplar, London, E.

LONDON.—Dec. 4.—For the erection of a laundry and disinfecting block at the borough isolation hospital, Muswell Hill, for the Hornsey Town Council. Mr. E. J. Lovegrove, borough engineer and surveyor, Municipal Offices, Highgate.

LONDON.—Dec. 10.—For supply and installation of three electric lifts and dismantling and removal of existing lifts at their Renfrew Road Workhouse, Lower Kennington Lane, S.E., and their infirmary, Brook Street, Kennington, S.E., for the Lambeth Board of Guardians. Deposit £2. Mr. J. L. Goldspink, clerk, Guardians' Offices, Brook Street, Kennington Road, S.E.

LONDON.—Dec. 10.—For supply of about eighty tons of steelwork for supporting platforms over engine traversers at Paddington Station, for the Great Western Railway Co. The Engineer, Paddington Station, London.

LONDON.—Dec. 12.—For alteration and extension of the receiving wards at the workhouse, Swaffield Road, Wandsworth, S.W., for the Guardians of Wandsworth Union. Deposit £2. Mr. F. W. Piper, clerk, Union Offices, St. John's Hill, Wandsworth, S.W.

LONDON.—Dec. 13.—For alterations and additions to the ladies' slipper baths at the public baths, Latimer Road, Wimbledon. Deposit £2 2s. The Borough Engineer and Surveyor, Town Hall, Wimbledon, S.W.

LUDDENDENFOOT.—Dec. 6.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with special subjects centre alterations at Luddendenfoot Council School—viz. builder, joiner,

plasterer, and painter. The Education Architect, County Hall, Wakefield.

MANCHESTER.—Dec. 7.—For erection of a Municipal school in Heald Place, Rusholme. Deposit £2 2s. The Education Offices, Deansgate, Manchester.

MANCHESTER.—Dec. 7.—For the supply of red terra-cotta for the new Heald Place Municipal school, Rusholme. Deposit £1 1s. The Education Offices, Deansgate, Manchester.

OVENDEN.—Dec. 6.—For the excavators', masons' and bricklayers', carpenters' and joiners', plumbers and glaziers', slaters', steel and cast iron, concreters', and patent glazing work required in the erection of a shed and basement at Ladyship Mills, Ovenden, Halifax. Messrs. J. F. Walsh, F.S.I., & G. Nicholas, F.R.I.B.A., architects and surveyors, 10 Harrison Road, Halifax.

OXFORD.—Dec. 10.—For the extension of the platform covering at Oxford Station, for the Great Western Railway Co. The Engineer at Paddington Station, London.

POOLE.—Dec. 3.—For erection of a kitchen and alterations to male imbecile ward at the workhouse, Longfleet. Mr. G. H. Seymour, architect and surveyor, Longfleet Road, Poole.

RAMSGATE.—Dec. 11.—For erection of an elementary school, consisting of boys', girls', and infants' departments, with cookery and manual instruction rooms, in Ellington Place, for the Corporation. Send in applications and £3 3s. deposit by Dec. 2 to Mr. G. G. Tucker, architect, 1 York Terrace, Ramsgate.

ROCHDALE.—For the builders' work of the Castleton Council School new infants' department. Send names to the Secretary, Education Committee, Rochdale.

ST. DAY.—Dec. 7.—For reseating the St. Day Wesleyan Methodist Church, Cornwall. Mr. S. Hill, architect, Green Lane, Redruth.

SCOTLAND.—Dec. 2.—For the mason, carpenter, plumber, plaster, and painter works of additions and alterations to factor's house and estate office at Old Cullen, and for mason, carpenter, and slater works of new salmon bothy to be erected at Portessie. Mr. J. Fowlie, Cullen House, Banff.

SCOTLAND.—Dec. 3.—For the several works required in connection with erection of a shelter in Maryhill Park, Glasgow, for the Corporation. The Office of Public Works, City Chambers, 64 Cochrane Street, Glasgow.

SCOTLAND.—Dec. 7.—For alterations on property behind 340 High Street, Kirkcaldy, for the Town Council. The Burgh Surveyor's Office, Kirkcaldy.

SCOTLAND.—Dec. 16.—For the excavator, mason, and brick works, carpenter, joiner, ironmongery, and glazier works, slater work, plaster work, plumber and gasfitter works, and heating work of proposed hall and alterations on church at Strathmiglo, Fife, for the Trustees of the U.F. Church of Strathmiglo. The Manse, and Mr. George Craig, architect, 85 Duke Street, Leith.

SILVERTOWN.—Dec. 10.—For erection of fire brigade station and firemen's dwellings, for the West Ham Town Council. Deposit £1. Mr. J. G. Morley, borough engineer, Town Hall, West Ham, E.

SOWERBY BRIDGE.—Dec. 4.—For the following works, for the Local Education Committee—viz.: Heptonstall (Colden) Council School, repair of playground; Mytholmroyd (Scout Road) Council School, erection of bathroom in head teacher's house. Mr. F. J. Macdonald, Education Offices, Sowerby Bridge.

STIFFORD.—Dec. 9.—For erection of a porter's lodge at the hospital, Stifford, Essex, for the Orsett Joint Hospital Board. Mr. C. M. Shiner, A.R.I.B.A., architect, 7 Adam Street, Adelphi, London, W.C., and Grays.

THACKLEY.—Dec. 3.—For the several trades required in the erection of a Children's Home at Thackley. Deposit £1 1s. Mr. Fred Holland, architect, 22 Manor Row, Bradford.

TONBRIDGE.—Dec. 19.—For the erection of a Council School at Sussex Road, to accommodate 400 scholars, and other buildings. (Mr. W. H. Robinson, M.S.A., county education architect.) Send applications and £1 deposit by Dec. 4 to Mr. Fras. W. Cook, secretary of the Kent Education Committee, Caxton House, Westminster, S.W. (See advertisement.)

TRURO.—Dec. 14.—For erection and completion of first section of premises for the County Museum and Art Gallery. The Museum Buildings, Truro, or Mr. S. Hill, architect, Green Lane, Redruth.

WALES.—For erection of a new theatre at Swansea, for Messrs. H. C. Behenna & Co. Send names and £1 1s. deposit to Mr. W. B. Jones, architect and surveyor, Glantawe Chambers, Wind Street, Swansea.

WALES.—Dec. 3.—For the execution of structural alterations and additions to the Maesteg town hall and market buildings. Deposit £1 1s. The Architect and Surveyor to the Council, 32 Commercial Street, Maesteg.

WALES.—Dec. 4.—For erection of hall and cloakrooms, for the Trustees of the Tabernacle English Baptist Chapel, Skinner Street, Swansea. Deposit £2 2s. Messrs. W. Cousins & Son, 7 Brynmor Crescent, Swansea.

WALES.—Dec. 4.—For new roofing, cementing, repairing, &c., to existing house and outbuildings, Bodhenlli, Cerrigceinwin, for the Anglesey County Council. Mr. W. F. Brindle, architect, High Street, Llangefni.

WALES.—Dec. 7.—For erection of the Eisteddfod pavilion, to accommodate 14,000 people, in Bailey Park, Abergavenny, for the Eisteddfod Frenhinol Genedlaethol Cymru, y Fenni, 1913. Mr. B. J. Francis, architect, Linden House, Abergavenny.

WALES.—Dec. 14.—For the construction of offices and boundary wall at the gasworks at Aberavon, for the Corporation. Deposit £1 1s. Mr. J. Roderick, borough surveyor, Aberavon.

WALES.—Dec. 16.—For erection of twenty-three playsheds at various Council Schools, Aberdare, for the Education Committee. Mr. T. Botting, director, Education Offices, Aberdare.

WATFORD.—Dec. 20.—For erecting a vicarage for Christ Church, St. Albans Road. (Mr. H. A. Saul, A.R.I.B.A., 20 Gray's Inn Square, London.) Deposit £1 1s. Messrs. Northcroft, Neighbour & Nicholson, surveyors, 329 High Holborn, London, E.C.

WOLVERHAMPTON.—Dec. 3.—For erection of a horse repository at the cattle market, for the Markets Committee. Deposit £1 1s. Mr. G. Green, M.I.C.E., borough engineer, Town Hall, Wolverhampton.

SOME NOTES ON THE USE, MISUSE, AND WASTE OF PUBLIC WATER SUPPLY.*

THE quantity and purity of water supplies have always been subjects of importance, and every year receive more and more attention. In urban centres and rural districts the desirability of a public supply of greater purity and larger quantity is generally found to be one of the most pressing questions. In the rural districts outbreaks of disease have now so frequently been traced directly to polluted wells that it can safely be said that at the present time the question of universal pure drinking water is one of primary importance to all classes of the community. The preservation of the quality as well as the quantity is, therefore, a serious responsibility upon the guardians of public water supplies.

Use.

In speaking of pure water, I hope we shall consider the question from a common-sense point of view, for when we

* A Paper read by Wm. Whitehouse, M.S.E. (Member), at a Western District meeting of the Institution of Municipal Engineers, held at Cinderford.

speak of "pure water" we mean "wholesome water." Sir Wm. Crookes has stated: "There is a great deal said about microbes, and a good deal of nonsense talked. When we hear that every glass of water we drink contains microbes by the thousand it is rather a shock. If we had too pure water, too much sterilised, we should all starve. A friend of his tried to bring his children up on hygienic principles, and had everything sterilised. The poor children were nearly starved, and at last they were given good, wholesome water with plenty of microbes in it, and they got as fat as possible."

Clark's tables give the average quantity of water required by an adult as follows:—

Two pints for drinking, in addition to about two pints retained in his food; three quarts for preparing and cooking his food; one gallon for cleansing dishes and food utensils; two gallons for house cleansing; three gallons for washing clothes; five gallons for cleansing the body; five gallons as a proportion, assuming a plunge bath is taken once a week; six gallons for w.c. use; total twenty-three gallons, being the average amount of water required daily for each individual.

Misuse and Waste.

I consider the theoretical quantity given above is too lavish, although it is much less than the Romans used in ancient times. Professor Rideal informs us that "ancient Rome, with its nine aqueducts, served its people with 300 gallons a day per head, including the supply for the public fountains, baths, circus, and amphitheatre, and for sanitary and trade purposes. A special State department administered the supply, and, as a result of these efforts, classic Rome was far more healthy than the modern city."

I think all will agree that this example could not be followed in these days, as there are very few waterworks that could stand that sort of thing.

It seems to me that a warning to the public is necessary to prevent waste or misuse of such an increasingly valuable commodity as pure water. The tendency of everyone who designs or manufactures water fittings and sanitary appliances is to rely upon an excessive supply of water, but they should be designed in such a way that the utmost efficiency and economy is obtained from moderate quantities, rather than by the waste of large quantities. An ordinary plunge bath holds from 30 to 70 gallons of water, and if everybody had a bath every morning, using, say, an average of 50 gallons each, there would be very few waterworks in the country that would be able to stand it. What is wanted is a greater use of the portable hip bath, with about three gallons of water, or some development of the shower bath by which a person could have a complete bath with a small expenditure of water, and so fulfil the ideal of the sanitarian, that every healthy person should have a head-to-foot bath once a day.

A very general idea prevails among water consumers that waste, although bad for the waterworks, is good for the drains and sewers, but that is not true because if the waste is due to defective fittings, it goes on in the daytime, plus the consumption, which in itself is, or ought to be, enough for all purposes. During the night, when the leakage is going on as before, and the consumption is small, the water is so distributed over a large area that it is of no use whatever as a flush to the drains and sewers, but is simply a waste of water which could be more effectively used in a legitimate manner.

There are various causes of the waste of public water. One is a misapprehension—as noted above—that a continual small stream of water along house drains improves the sanitary condition of the house. This is a mistake. A short sudden rush at intervals has a beneficial effect in flushing drains, but a continual dribble has none. There is no use, therefore, in allowing small streams of water to flow continually down water-closets, or other sanitary appliances. By improvements in the form of water-closets and of flushing apparatus, the former have been made quite self-cleansing with a flush of two gallons or even of less, appliances being insisted upon that make it impossible to give a greater flush.

However, it must be admitted that by far the greater part of the waste that takes place is due to carelessness on the part of the consumers of water, often carelessness that can only be considered as culpable, if it be borne in mind that wilful waste of water supplied by waterworks is simply stealing. The water is actually public property if the works belong to a corporation or council, as the case may be; and even if they belong to a company the water is public property in the sense that the price which each individual has

to pay to the company must in great part depend on the consumption of the whole, including waste.

Although not generally the case, many householders are indifferent to the waste of water; it is therefore a matter of indifference to them whether, for example, a tap is running the whole night or not. Where the cost of leathering a tap is charged to the consumer, there are some who consider that it is to their advantage to allow the leakage to continue. In the works under my control—although the average consumption is low—we lose every night, between the hours of 12 P.M. and 6 A.M., from 15,000 to 20,000 gallons of water. The major portion of this quantity must be waste.

Apart, however, from this, a great deal of leakage takes place, simply because it is difficult to appreciate how large a quantity is lost on account of an apparently very small leakage continuing through the whole twenty-four hours. It would astonish most people who see water merely dripping from a tap, or from a leaky pipe, to be told that the loss is likely to be 3 or 4 cubic feet in twenty-four hours, or fully the average consumption of water of one individual. Yet if a measuring glass be taken it will be found that from 2 oz. to 3 oz. per minute of water may fall merely in the form of drops, and this corresponds to a large consumption in twenty-four hours for one person. It needs but a very small dribble to discharge 20 cubic feet of water in twenty-four hours, or, say, the quantity that ought to be consumed by an average household.

This matter of the great quantity of water that may be lost by a continual leakage is well illustrated by Mr. W. Hope, C.E. The diagram below is taken from a paper of his on the subject of the waste of water, and is described in his own words.

The diagram shows a lead pipe drilled with various-sized holes, the burr on the inside not being removed. The actual number of gallons per day which passed through each hole under a pressure of 45 lb. per square inch is noted on the drawing, together with the corresponding number of persons that quantity would supply at the rate of 15 gallons a head per day.

Results of experiments on the flow of water through circular holes in 1/2 in. lead pipe under a pressure of 45 lb. per square inch, showing number of persons who might be supplied by the discharge through flaws of various sizes.

Prevention of Misuse and Waste.

The question of waste prevention has always been a source of trouble, and one of anxious consideration for the engineer. Burton, in his treatise on water supplies, writes as follows:—

"Of late years large reductions in the consumption of water per head have been made by careful arrangements for saving waste. Waste has been saved in several ways; for example: (1) by the use of district meters; (2) by the use of house meters; and (3) by insistence on the use of house fittings of good quality only, and on their frequent inspection. I may say concerning the third item that the difficulty in preventing waste in waterworks has seldom been felt to any great extent in connection with the street mains, or the larger appliances belonging directly to the proprietors of the waterworks. These are fixed under the charge of skilled engineers, and are under their supervision afterwards. It thus occurs that leakage is not very likely to

THE memorial altar which we illustrate was given to the parish church of St. Mary, Humber, Herefordshire. It is of oak. The figure sculptures were the work of Mr. N. Hitch, of Vauxhall. The altar itself was made by Mr. H. Watson. The small brass let into the south side was the work of Messrs. Gawthorp, of Long Acre. The whole from the designs and under the personal supervision of Mr. E. Swinfen Harris, F.R.I.B.A., of London and Stony Stratford.

occur in them, and that if it does it is soon stopped. In the case of house fittings it is quite different. These are put in by the builder or the householder, who employs whomsoever he likes; it is not in the least to the advantage of the former of these to be sure that no water waste takes place, and it is to the reverse of the interest of the latter to prevent leakage, because he has nothing to pay for leakage, while he has to pay for preventing it. Very stringent regulations have been introduced in most English and many Continental towns for the prevention of waste in houses, and these have been put efficiently in force in a considerable number of cases."

Notwithstanding the severe climatic changes in England, few precautions are taken against the grave inconvenience of waste occasioned by frost. House pipes are often left unprotected, and so placed that a burst will cause considerable damage. Cisterns are frequently situated outside, and when they freeze solid are the cause of serious annoyance. The pipes and fittings in the ground should always be laid a good depth, and all exposed pipes and fittings should be protected with some non-conducting material.

I expect the Deacon waste-water meter is familiar to all of you; there is no doubt about its excellency in the discovery of waste, as one meter will control a large part of a district, but there are many authorities who would hesitate to instal this system in consequence of its cost and manipulation. It has even been suggested that every house should be supplied by meter just in the same way that it is supplied by gas. That is an exceedingly expensive way of controlling the supply on a large scale, and leads to the other extreme of undesirable parsimony in the use of water. To instal the meter system in my own district would cost £5,000, the cost of maintenance and inspection would necessarily be higher, which would mean raising the price of the water *pro rata*, as consumption was large or small, to cover the extra cost of maintenance.

There is one matter I should like to refer to, with which

I have no patience, and that is the parsimonious spirit of some public water authorities who begrudge the engineer in charge the assistance of inspectors and fitters for the proper, economical, and expeditious control of the works which he has to administer.

Quite recently a surveyor informed me that the waste of water in his district was so large as to be quite absurd. It has never been the custom of his authority to leather taps, but some time ago he made an inspection of his district, and with some assistance leathered, or saw to the leathering of, the taps himself. In one month, he tells me, he saved by these means no less than 400,000 gallons. Assuming it cost 6d. per 1,000 gallons to pump and distribute the water, the saving is quite equal to paying the wages of two men permanently employed, apart from the saving to the consumer's fittings, and also the saving of this precious and absolutely necessary fluid.

Speaking of the works under my own control, I am pleased to say that it has always been our custom to leather and repair consumers' service taps, &c., and to fix new taps free of charge (excepting the cost of the tap). The result has been highly economical and satisfactory, the average consumption, excepting periods of continued drought, does not exceed 12 gallons a head per day, including that used for trade purposes, and we supply a population of 10,000.

Previous to obtaining an additional supply, I am quite sure our system, comparatively speaking, was saved from absolute failure by our methods of checking waste.

Our methods have enabled us to keep in touch with, and to gain the confidence of, the consumers; the reporting of leakages is encouraged; and it has had the effect of making each and all of them an inspector, as it were. We are promptly apprised of leakages, and if they are not promptly attended to, of course, there is a row.

Notwithstanding the result, there are some, I am sorry to say, who disagree with our methods, but I sincerely hope

THE wall tablet, from the designs of Mr. W. G. B. Lewis, F.R.I.B.A., is to the memory of the vicar of St. Michael and All Angels Church, London Fields, and is fixed on the chancel pier over the seat which he occupied for eighteen and a half years. It was modelled by Messrs. T. & E. Nicholls, sculptors, of 28 Wincott Street, Kennington Road, S.E., and reproduced in electro-copper and gilt by the Kupron Co. The foliated cross in the quatrefoil and the seeds in the ornament on either side are of cast aluminium. The cost was subscribed by the friends of the late vicar. The church was built in 1864, Mr. Hakewell being the architect. Although a cheap church, the interior effect is very good and spacious.

that wise and experienced counsels will prevail. Under any circumstances, no one can dispute that our system means convenience, advantage, and even privilege to consumers, and it is undoubtedly a joint means of preventing waste.

It is only fair to state that plunge baths and water-closets are not in general use, but probably 40 per cent. of the consumers have one or the other, or both, so that our rate of consumption is certainly 40 per cent. below the theoretical quantity required per adult per diem.

Before concluding, I should like to summarise a few things which would certainly have the result of checking waste.

(1) *Night Inspection.*—This need only be periodical, but it would be the means of discovering underground leakages, as well as other causes of waste. The method to adopt would be for the inspector to proceed round the district during the night with a sounding rod, and to hand over the result of his discoveries to the fitters for further enquiry into the matter the next morning. This would have the effect of finding out wilful waste, as well as that due to defective fittings.

(2) First-class fittings of approved construction should be rigidly insisted upon, as well as the laying and fixing of pipes for protection against frost.

(3) The enforcement of 2-gallon closet flushing cisterns, and automatic flushing cisterns of stated capacity for urinals. Great economy in the use of water could be effected if it were possible to provide a satisfactory and water-saving substitute for the plunge bath.

(4) Outside closets could be an approved make of the waste-water type.

(5) Public inspection and repair of draw-off apparatus, such as leathering, &c., free of charge.

(6) Covered reservoirs for spring water to obviate the waste caused by the necessity of cleansing of algæ, or water weed, which rapidly forms in hot weather. (This advice may be somewhat superfluous, as spring water reservoirs are very rarely left uncovered nowadays.)

(7) Plenty of air valves and sluice valves to prevent the emptying of long lengths of main when repairing or tapping.

(8) Apparatus for tapping mains under pressure, and so save emptying them when doing this work.

(9) Pressure reducing valves in very hilly districts, wherever possible to fix them.

I should like to say, in conclusion, that one of the objects of this paper is to give food for thought among those who may be personally interested in this subject, whether publicly or privately—especially with regard to its importance. The question of preventing waste as far as possible, without curtailing the legitimate requirements, or causing inconvenience, annoyance, or undue expense to the consumer, would then, I think, be soon effected. Furthermore, as waterworks engineers, I am sure we all agree that the legitimate prevention of waste in our public water supplies is a serious duty, whether from a national or economical point of view.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

BEDFORDSHIRE.

Leighton Buzzard.—Unionist Club House, High Street. Mr. T. H. Bishop, A.R.I.B.A., architect.

CHESHIRE.

Wilmslow.—R.C. Church (£4,000).

CORNWALL.

Newquay.—Police station: additions. Mr. A. E. Brookes (of Truro), County surveyor.

CUMBERLAND.

Cummersdale.—Boiler house and other works, for Messrs. Stead, McAlpin & Co., Print Works.

DEVON.

Alphington.—House. Mr. E. H. Harbottle (F.R.I.B.A.) & Son (of Exeter), architects.

Barnstaple.—House, Park Lane, Newport. Messrs. W. C. Oliver & Son, architects.

Devonport.—Church and schools, Keyham Barton. Mr. C. Cheverton, architect.

Newton Abbot.—Six houses, Fairfield. Messrs. F. J. Zealley, builders.

Prince Rock.—Almshouses. Mr. A. Wiblin (of Plymouth), architect.

DORSET.

Swanage.—"The Grosvenor": additions. Messrs. Parsons & Hayter, architects.

DURHAM.

Annfield Plain.—Twenty Council houses.

Brandon Colliery.—Twelve cottages for the Aged Workers' Homes Committee. Colliery engineer (of Brancepeth).

Byers Green.—Council School for 500 places. Mr. H. A. Curry (of Newcastle-upon-Tyne), architect.

Castletown.—Council School: alterations and improvements. Mr. N. Richley (of Durham), architect.

Cowshill.—Church (£3,000). Messrs. Clark & Moscrop, F.R.I.B.A. (of Darlington), architects.

Oakensham.—Council School for 500 places. Mr. W. Rushworth (of Durham), architect.

Spennymoor.—Picture Theatre, Weardale Street, for the Durham County Picture Hall Co.

ESSEX.

Brentwood.—Infants' Council school.

GLOUCESTERSHIRE.

Bristol.—Jam factory. Messrs. W. H. George & Sons (of Ashton-under-Lyne), architects.

HAMPSHIRE.

Gosport.—St. Luke's Church.

Lymington.—Cottage Hospital. Mr. Bernton-Benjamin, architect.

Portsmouth.—Ferro-concrete stores, Camber Docks.

HERTFORDSHIRE.

Buntingford.—Roman Catholic Church.

KENT.

Gravesend.—Workhouse additions. Mr. E. J. Bennett, A.R.I.B.A. (of London), architect.

LANCASHIRE.

Ashton-under-Lyne.—Elementary school, Waterloo.

Fleetwood, Horwich and Whitworth.—Elementary schools.

Heysham.—Shops and houses for the Lancaster Co-operative Society. Messrs. Austin (A.R.I.B.A.) & Paley (of Lancaster), architects.

Leigh.—Cinematograph Theatre, Railway Road. Messrs. J. C. Prestwich & Sons, architects.

Patricroft.—Church (for 600 sittings), Winton. Mr. R. T. Beckett (of Chester), architect.

Reddish.—Picture Palace (£2,500). Mr. Ogden (of Manchester), architect.

Rochdale.—Post Office (£12,000). Mr. C. P. Wilkinson (of H.M. Office of Works, London), architect.

Whitworth.—(See above.)

LEICESTERSHIRE.

Leicester.—Labour Exchange: alterations and extensions. H.M. Office of Works, London.

LINCOLNSHIRE.

Gainsborough.—King's Theatre: additions. Mr. Green, architect.

MONMOUTHSHIRE.

Abergavenny.—Workhouse: infirmary, laundry, &c. (£10,000). Mr. B. J. Francis, architect.

NORTHAMPTONSHIRE.

Northampton.—Council School for 1,200 children, St. James'.

NORTHUMBERLAND.

Newcastle-upon-Tyne.—Picture Theatre. Messrs. Hope & Tasker (A.R.I.B.A.), architects.

NOTTINGHAMSHIRE.

Arnold.—Headquarters for the County Territorial Force Association (£1,500).

Nottingham.—Drill Hall and Headquarters, &c., Cherry Holt Lane, for the County Territorial Force Association (£3,700).

Ruddington.—Village Hall (£1,200).

OXFORDSHIRE.

Oxford.—Chemical laboratories, South Park Road, for the University.

SOMERSET.

Bruton.—Public Library. Mr. A. J. Pictor, A.R.I.B.A., architect.

STAFFORDSHIRE.

Bucknall.—Relief Station (£750).

Lichfield.—Theatre for 800 sittings, Falmouth Street, for Mr. F. M. Barber. Messrs. Heath (of Manchester), builders.

Stoke-upon-Trent.—Fire Station, Welsh Street (£900).

Tamworth.—St. John's School: alterations and enlargement.

SURREY.

Haslemere.—"Hammercombe House," Hill Road: additions. Mr. H. Hutchinson, architect. Mr. A. E. Privett, contractor.

Kingston-on-Thames.—Congregational Church. Mr. E. Carter, A.R.I.B.A., architect.

SUSSEX.

Aldingbourne.—Council School additions (£550).

Crawley and Horsham.—Council Schools.

Lancing.—Infants' Council School (£1,500).

WORCESTERSHIRE.

Broadway.—Council School.

Bromsgrove.—Proposed Council School for 800 places.

Catshill.—Council School for 500 places.

Malvern Link.—Council School extension by ninety places (£700). Messrs. Pritchard & Pritchard (of Kidderminster), architects.

Redditch.—Cookery and Handicrafts Centre (£1,800).

Mr. A. V. Rowe, architect.

Rowley Regis.—Technical schools, Wright's Lane (£1,000).

YORKSHIRE.

Bingley.—Picture Theatre (£3,000). Messrs. J. B. Bailey & Son (of Keighley), architects.

Bridlington.—Bank, Manor Street. Mr. T. B. Whinney, F.R.I.B.A. (of London), architect.

Banking premises, King and Queen Streets: additions and alterations. Mr. J. Earnshaw, architect.

Business premises, Chapel and King Streets: re-building. Mr. T. B. Atkinson (of Hull), architect.

Cleckheaton.—Public Baths: additions and alterations.

Mr. C. Lund, Council surveyor.

Elland.—Cinematograph Theatre, Coronation Street, for the Central Pictures (Elland), Ltd.

Keighley.—Technical Institute extensions. Messrs. W. H. & A. Sugden, architects.

Kimberworth.—Congregational Church (£3,000).

Lepton.—Church Institute. Messrs. Cocking & Abbey (of Huddersfield), joint architects.

Rotherham.—Cinematograph Theatre (£3,000). Messrs. Chadwick & Watson (of Leeds), architects.

Scarborough.—Premises, St. Thomas Street. Mr. T. W. Whipp, A.R.I.B.A., architect.

Sheffield.—Presbyterian Mission Hall, Bath Street (£1,250).

WALES.

Aberystwyth.—Thirty workmen's dwellings, Trefechan.

Glyn Neath.—Council School.

Llandovery.—Garage for Mr. T. Roberts (of the Crown Stores).

Newtown.—Welsh National Memorial.

SCOTLAND.

Alloa.—Picture Palace for 500 sittings (£1,600), for F. Jacoveli and others.

Arbroath.—Sheriff Courthouse: alterations. Mr. P. C. Smith, Burgh surveyor.

SCOTLAND—continued.

Blairgowrie.—Church, Balmoral Road, Rattray (£2,500).
Mr. L. Falconer, architect.
Broughty Ferry.—Parish Church Hall.
Clydebank.—Six cottages, Cambridge Avenue, for Mr. J. Watson, of Glasgow
 "Trades Hotel": alterations for the Adelphi Stores Co., Ltd.
Dundee.—Glebeland School: re-construction.
 Home for Women, Paton's Lane (£1,000).
Giffnock.—Two double villas, off Church Road, for Mr. John Taylor.
Glasgow.—Twenty-eight terrace houses, Auldhouse and Lochlea Roads, Newlands, for Mr. John Baxter (of Kirkintilloch).
Grantown-on-Spey.—The "Palace" Hotel: additions.
Mr. R. B. Pratt, A.R.I.B.A. (of Elgin), architect.
Leith.—Five-storey warehouse, the Shore and Broad Wynd, for Messrs. R. & D. Slimon (of Shore).
Paisley.—No. 104 George Street and No. 54 High Street: additions for the Paisley Provident Co-operative Society, Ltd.
Pitlochry.—Cluniemore House: alterations. Separate trade contractors.

IRELAND.

Gibbstown.—Gibbstown House: re-building. Messrs. G. & T. Crampton (of Ballsbridge), contractors.
Athlone.—Courthouse (£3,000).

**PATENT SPECIFICATIONS PUBLISHED
 NOVEMBER 21, 1912.**

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

Nos. 23,692 and 23,695. Oct. 26, 1911.—H. F. Berry, 9 Victoria Street, S.W. Heating and drying stone and other materials for use on roads and like surfaces.

24,027. Oct. 30, 1911.—A. F. Berry, 27 Woodville Road, Ealing. Electrically heated cooking-ovens.

24,117. Oct. 31, 1911.—Date claimed under International Convention Nov. 1, 1910. Ludwig Schomburg, 53 Kaiserstr., Gelsenkirchen, Germany. Pipe joints.

24,000. Oct. 30, 1911.—H. F. Berry, 9 Victoria Street, S.W. Apparatus for heating and otherwise treating stone and like materials.

24,584. Nov. 6, 1911.—W. J. Hollick, Enderlie, Chatham Road, Old Trafford, Manchester. Electric light fittings.

24,656. Nov. 6, 1911.—H. R. O. Zeitz, c/o The Kieler Maschinenbau-Aktiengesellschaft, of Kiel, Germany. Machines for the manufacture of roof tiles or other similar articles.

25,513. Nov. 16, 1911.—J. A. Coombs, "Linslade," Old Road, Dukinfield, Chester, and S. Seaborne, Newton, Hyde, Chester. Apparatus for distributing sewage or like effluents on to filter beds.

26,112. Nov. 22, 1911.—O. D. Binger, 16 Wardour Street, W. Burglar alarm.

26,375. Nov. 25, 1911.—J. M. Leighton, 43 Broadway Court, Westminster, S.W. Pile drivers.

28,994. Dec. 23, 1911.—G. W. Hitchcox, Railway Approach, Well Hall Road, Eltham, Kent. T-square and guide for attachment to drawing boards.

29,228. Dec. 28, 1911.—J. Debize and A. Rigaud, 120 Boulevard Menilmontant, Paris. Safety lock for doors.

508. Jan. 6, 1912.—Messrs. Lippiett, 32 Park View, Tredegar, Mon. Apparatus for timber hauling, weight lifting, and the like.

1,054. Jan. 13, 1912.—H. M. Plucknett, 12 Bishopstoke Road, Eastleigh, Hants. Gas stoves.

1,279. Jan. 16, 1912.—The British Mathews, Ltd., and J. M. Pirrie, 147 Upper Thames Street, E.C. Gravity conveyors.

4,418. Feb. 22, 1912.—Peter Dick, 19 South Street, Andrew Street, Edinburgh. Making petrolised or air gas.

5,893. Oct. 26, 1911.—H. F. Berry, 9 Victoria Street, S.W. Heating and drying of stone and other materials for use on roads and like surfaces.

6,113. March 11, 1912.—E. C. Tonkin, 183A Peckham Park Road, S.E., and H. T. Collins, 3 Trafalgar Square, S.E. Taps for controlling the supply of fluids.

10,379. May 1, 1912.—E. Richards, 7 Cart Lane, Temple, Bristol, and F. M. & E. H. Burris, 40 Redcliffe Street, Bristol. Clips, straps, or holdfasts for pipes and the like.

12,217. May 23, 1912.—T. R. Von Oxinski, 18 Dabrowskiego, Lemberg, Austria. Marking out timber, stones, and the like.

TRADE NOTE.

Messrs. JOHN GRUNDY, LTD., heating and ventilating engineers, 393A City Road, E.C., some years ago supplied the heating apparatus to Christ Church Cathedral, Dublin. It is, therefore, with justifiable pride that they can point to the following letter received in June last from Mr. R. Caulfeild Orpen, F.R.I.A.I., A.R.H.A., the cathedral architect:—"I have pleasure in testifying to the satisfaction our heating apparatus continues to give to the cathedral authorities. The system has now been in use for many years since it was installed under the direction of the late Sir Thomas Drew." The Dean of Christ Church, in another testimonial, says the apparatus "warms the whole building equably, and does not cause any heaviness in the air."

THE Local Government Board have consented to the Finance and General Purposes Committee of the Lancashire Asylums Board borrowing £30,000 for the erection of villas at Lancaster Asylum for the accommodation of female private patients.

THE Architectural Association of Ireland held an ordinary meeting at 15 South Frederick Lane, Dublin, on Tuesday, November 19, the President, Mr. George L. O'Connor, F.R.I.A.I., in the chair. There was a large attendance of members. The following were elected members of the Association:—Messrs. W. Mortimer Paton, A.R.I.B.A., N. Langley Phillips, W. MacLaren, and W. H. O'Donnell. Members rejoined: Messrs. J. Howard Pentland, R.H.A., and S. Martin Ashlin, A.R.I.B.A. Dr. MacDowel Cosgrave, Hon. Secretary of the Georgian Society, read a paper on "Eighteenth-Century Architecture in Dublin." Mr. Caulfeild Orpen, R.H.A., proposed a vote of thanks to the lecturer, which was seconded by Mr. Lucius O'Callaghan.

THE Incorporated Church Building Society held its usual monthly meeting on November 21 at 7 Dean's Yard, Westminster Abbey, S.W. Grants of money were made in aid of the following objects, viz.: Building new churches at Walesby, All Saints, Lincs., £50; Yelverton, St. Paul, Devon, £100; Harrow-on-the-Hill, St. Peter, Middlesex, £200; and West Shore, Church of Our Saviour, Llandudno, £70. Rebuilding the churches at Gloucester, St. Catherine, £90; and Milton, St. James, Portsmouth, £160; and towards enlarging or otherwise improving the accommodation in the churches at Cavenham, St. Andrew, St. folk, £10; Christ Church (Forest of Dean), Glos., £10; Fir Tree, St. Mary-the-Virgin, county Durham, £40; Fitzroy Square, St. John the Evangelist, Middlesex, £40; Hambledon, St. Peter, Surrey, £10; Old Ford, St. Paul, Middlesex, £50; Othery, St. Michael, Somerset, £40; Radford, St. Nicholas, Coventry, £75; Redberth, Pems., £50; and Hendon, St. Paul, Sunderland, £30. Grants were also made from the Special Mission Buildings Fund towards building Mission churches at Bridgmary, Hants, £10, making in all £35; Cleo Hill, St. Peter, Salop, £20; East Studdal, Kent, £15; and West Humberstone, Leicester, £40. The following grants were also paid for works completed: Newfoundpool, St. Augustine, Leicester, £400, being balance of a grant of £1,000; Woolacombe, St. Sabinus, Devon, £80; Slade Green, St. Augustine, Kent, £20; Caerwent, St. Tathan, Mon., £40; Bethnal Green, St. Simon Zelotes, Middlesex, £10; Dinnington, St. Leonard, Yorks., £20; Woolwich, St. John, Kent, £50; Walton-on-the-Hill, St. Mary, Liverpool, £70; Charlestown, St. Thomas, Halifax, £20; Highgate, All Saints, Middlesex, £50; Grimsby, St. Augustine, £150; Welton, St. Mary, Lincoln, £20; Eastrop, St. Mary, Hants, £40; Sneynton, St. Stephen, Notts, £100; Cardiff, St. Stephen, £200; Pontyates, St. Mary, Carms., £75; Luckington, St. Mary and St. Ethelbert, Wilts, £20; East Hanney, St. James-the-less, Berks., £10; Newtown, near Salisbury, £50; Two Mile Hill, St. Alban, Bristol, £30; Silfield, St. Helen, Wymondham, Norfolk, £20; Pontygwyddel, St. John-the-Baptist, N. Wales, £10; Trebanos, SS. Michael and All Angels, Glam., £40; and Westcliff-on-Sea, SS. Michael and All Angels, Essex, £50. In addition to this, the sum of £790 was paid towards the repairs of thirty-two churches from Trust Funds held by the Society, and sums of money were accepted as Repair Funds for the churches at Edenbridge, St. Peter and St. Paul, Kent, and Kensal Town, St. Thomas, Middlesex.

LONDON MASTER BUILDERS' ASSOCIATION.

A MONTHLY meeting of the Council was held on Thursday, November 21, at Koh-i-Noor House, Kingsway, W.C., the chair being occupied by Mr. James S. Holliday, President.

The Law and Parliamentary Committee's Report on legal cases and matters connected with the National Insurance Act was received and adopted.

The Report of the Conciliation Board was read and approved.

Correspondence relating to trade matters was considered.

Mr. H. C. Horswill, Forest Gate, was elected an ordinary member, and Mr. A. George's nomination as an Associate member was accepted.

COMPETITION NEWS.

CANADA.—With reference to the competition of plans for a Town Hall at Winnipeg, to be erected at an estimated cost of \$3,000,000 (about £616,600), the Imperial Trade Correspondent at that place (Mr. J. Appleton) now reports that the regulations as published limit the competition to British subjects resident in Canada.

WELLINGTON.—The Urban District Council are about to promote a competition in order to obtain designs for fifteen additional workmen's dwellings to be let at a weekly rental of from 3s. to 3s. 6d. each. A premium of £10 10s. will be offered.

NEW CATALOGUES.

It is not often we meet with a trade list which is so really instructive as the illustrated catalogue recently brought out by Messrs. Doulton & Co., Ltd., in connection with their drainage and building materials. As far back as the London Exhibition of 1851 this firm received a first class medal for stoneware; since then they have been accumulating honours with almost mechanical regularity, until they have now received over 250 gold medals, diplomas, and other awards at important exhibitions in all the four Continents. The name of Doulton stands high all over the world as the universal providers for sanitary science. The new catalogue comprises the following sections: Stoneware pipes and fittings for drainage and sewerage; manhole channels; sewer-gas interceptors, gullies and grease interceptors; cast-iron manhole covers; chimney tops, cattle troughs, and building sundries. But, as we have already hinted, Messrs. Doulton send out something more than a price-list, for the pages contain a considerable amount of sanitary information which is lucidly illustrated. Special attention is directed to the opening section, No. 19, describing joints for stoneware pipes—particularly Doulton's "Grouted Composite Joint," which, as most of our readers are doubtless aware, combines two distinct joints—an inner seal formed by two bands of composition and an outer seal of Portland cement grout. Another important section is No. 22, showing the most modern designs of interceptors—for, despite the recent Report by the Departmental Committee, intercepting traps are likely to remain long in favour. The longest section is No. 23, which is devoted to yard gullies, grease interceptors, &c. To architects the hygiene of building must always be a most important aspect of their work, and while that is so the profession will always look with confidence to Messrs. Doulton for the highest-class workmanship and the latest improvements.

Mr. John Thorp, 98 Gray's Inn Road, W.C., has been making models for over thirty years, and it is only natural that he should be enthusiastic about them. But in his recent catalogue he makes no extravagant claims on their behalf. The numerous illustrations show the great diversity of work he has executed. A $\frac{1}{8}$ -inch scale model of a house, a $\frac{1}{2}$ -inch scale model of a water tower, an inch scale section of an electric-light station, a 1-200 scale model of hospital buildings, and picturesque models of Old London are some of the many illustrated. It is interesting to know as to cost that, roughly, a $\frac{1}{2}$ per cent. basis may be worked on for villas and small private houses, while for larger buildings the percentage comes lower.

The latest catalogue we have received from the Carron Company is devoted to rain water, soil goods, and sanitary castings. This Company are able to meet any demands in this class of goods, which can be had fine cast, galvanised, enamelled, or coated with Dr. Angus Smith's solution. There is no need to talk about the high character of all the Carron products, as they have talked for themselves during the past century and a half. The catalogue is well produced, and, with its limp covers, does not encroach on over-much space.

A handy catalogue issued by the Electric and Ordnance Accessories Co., Ltd., Aston, Birmingham, is entitled "Modern Heating by Electricity." It deals with their "Eclipse" convectors and radiators. The makers give a guarantee of five years to replace free of charge any convector heating elements which may fail prematurely through faulty material or workmanship. The same guarantee applies to the "Eclipse" combined convectors and radiators which unite the essential features of both methods of heating. The designs for the three types of "Eclipse" heaters are in many cases of a most pleasing kind.

"Down-Draught and its Cure" is the title of an excellent booklet by means of which Messrs. J. H. Sankey & Son, Ltd., Essex Wharf, Canning Town, E., explain and illustrate the virtues of their "Down-Draught" Preventing Pot. The pot's most obvious merit is an entire absence of all movable or metal parts. It is made of selected clays (in red, buff, and salt glazed), and is in one piece. Its upper part is so shaped as to consist of three storeys of louvres, down the steeply-sloping sides of which the down-draught rushes and becomes dispersed before reaching the body of the pot. If the wind is blowing across the pot it rushes up the louvres, and carries the ascending smoke with it. In other words, this pot both increases up-draught and prevents down-draught. In exceptionally difficult cases it may be necessary to close the top of the pot with a cap, which discharges the smoke solely through side-openings. The pots are sold in three heights—namely, 30 inches, 42 inches, and 48 inches, and with bases of 12 inches and 14 inches. In appearance they make a grand improvement on the many incredibly ugly expedients which destroy aesthetically the skyline of many an excellent building.

In the ceramic world the firm of Messrs. Keeling & Walker, of Stoke-on-Trent, looms large. We understand that the Keeling family have been connected with the potting industry since 1770. But apparently this fact is no bar to up-to-dateness in their business. They have just issued a handsome new catalogue, No. 12, which seems to include the latest and best of everything in the way of raw materials, colours, glazes, chemicals, sundry utensils, and machinery for the ceramic industry. Quality has been the first consideration. The various sections are prefaced by clearly written notes, which contain many valuable suggestions and information as to what to do and what not to do.

VARIETIES.

THE Local Government Board has sanctioned the £9,000 loan for the Wirksworth sewerage scheme.

THE Right Hon. Earl Fortescue, Lord Lieutenant of the County of Devonshire, has consented to accept the office of President of the twenty-eighth Congress of the Royal Sanitary Institute, to be held at Exeter from July 7 to 12, 1913.

MESSRS. SAVILLE & MARTIN, architects, Dacre House, Arundel Street, W., have prepared the plans for a cinematograph hall proposed to be erected on Nos. 593-597 Old Kent Road.

AN exhibition of materials, appliances, and machinery used for the construction, maintenance, and improvement of roads will be held at the Royal Horticultural Hall, Vincent Square, Victoria Street, London, S.W., in connection with the International Road Congress to be held in London in June 1913. It will be opened on Monday, June 23, and closed on June 28.

AN event of some interest in the architectural world is the translation into the Russian language of Banister Fletcher's "History of Architecture on the Comparative Method," published by B. T. Batsford, 94 High Holborn, W.C. This undertaking has been successfully accomplished after several years' labour by M. Robert Böker, of St. Petersburg, who is a member of the Imperial Society of Russian Architects. M. Böker, like many Russians, talks English fluently, and has been able to effect an exact translation without deteriorating from the value of the original work.

THE Science Standing Committee of the Royal Institute invite members of the R.I.B.A. and others interested to forward particulars of instances of defective roofing-tiles which have come to their notice. It is desirable where possible that such particulars should be accompanied with samples of such defective tiles, with any remarks upon the nature of the defects and their cause, also giving information as to the make of the tile, i.e. hand-made or otherwise, with its place of origin, and any remarks upon the nature of the material from which the tiles were made.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

•• As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 1s. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

JAMAICA.—Jan. 31.—The Mayor and Council of Kingston offer a prize of £100 for a design for municipal buildings (suitable for construction in reinforced concrete) to cost not more than £9,000. Charge 2s. For information apply to Messrs. Alexander Young (London), Ltd., 60 Fenchurch Street, London, E.C.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

CONTRACTS OPEN.

ABERSYCHAN.—Dec. 16.—For erection of a higher elementary school to accommodate 250 scholars at Abersychan, Mon., for the Monmouthshire Education Committee. Deposit £2 2s. Mr. J. Bain, F.R.I.B.A., County Council Offices, Newport.

TOWN PLANNING SCHEMES.

A MEMORANDUM issued by the Local Government Board relative to the operation of the Housing and Town Planning Act (1909) mentions that twenty local authorities have been granted authority by the Board for the preparation of town-planning schemes. Three of these schemes—two by Birmingham Corporation affecting different areas in the city, and one by Rochdale—have been prepared and submitted for approval. Among the other local authorities that are preparing schemes are Bournemouth, Chesterfield, Halifax, Hanwell, Liverpool, Newcastle-on-Tyne, Sheffield, Southport, Stoke-on-Trent, and Walthamstow. Applications for authority to prepare schemes have been received from twelve other authorities, and 124 local authorities have proposals for schemes under consideration. The memorandum goes on to state that in many cases landowners are adopting better methods of developing estates without the formalities of town-planning schemes, and that the Act has had a good influence, quite apart from the actual preparation of schemes under it.

THE Board of Trade report on the state of the labour market in October says that employment continued good, and the upward movement in wages continued. Compared with last year, all the principal industries showed an improvement, and from the 383 trade unions making returns there was shown a further decrease in the percentage of unemployment. The changes in wages taking effect during the month affected 525,000 workpeople, and resulted in a net increase of nearly £25,000 per week.

AN American Consular report states that signs of continued increase in commercial and industrial activity in Venice and district have been everywhere visible during the last two years. Palaces and houses have been restored in the sumptuous old style, and improved by the addition of modern comforts; streets and canals have been enlarged, new bridges built, and a greater number of steamers, larger in size, have been plying between different parts of the city and to the islands.

At the last meeting of the Edinburgh School Board there were under consideration plans of the proposed supplementary school in the Bellevue district of the city. The plans showed a school providing accommodation for 960 pupils, in twenty-four class-rooms, with an allowance of 15 square feet per pupil. The total cost was estimated at £54,000, the main school building being £30,000, the workshop block £22,000, and laying out site, &c., £2,000. A member moved recommittal with the view of having plans prepared for a less costly school. They were proposing, he said, to spend £27,000 for amenity. It was agreed to remit the matter to the committee, with powers to get expert advice.

THE Sanitary Committee of the Carnarvon Town Council have practically completed an extensive housing scheme. One part provides for the erection of about sixty houses, some in blocks and the others semi-detached, on the Bethel Road. These may be described as of the better class of workmen's dwellings, having gardens both front and at the back, and they will be let for rents varying from 5s. to 6s. per week. It is expected that the total cost of building each house, including the land, will range from £230 to £260, and the whole outlay will not fall short of £16,000. Under the second part of the scheme it is proposed to put up some twenty or thirty houses in the south end of the town, in the neighbourhood of Hendre Street, and in this case the rent will not exceed 3s. to 4s. per week, the total cost being £4,000.

THE OLD LONDON G.P.O. FACADE.

IN July 1912 the First Commissioner of H.M. Works intimated that he was prepared to present to the London County Council the portico and pediment of the old General Post Office, St. Martin's-le-Grand. After considering the matter, the Local Government, Records and Museums Committee caused a reply to be sent to the effect that they were unable to recommend the Council to take advantage of the offer, owing to the fact that no site suitable for the re-erection of the facade was available. They suggested, however, that the facade might fittingly be re-erected in the proposed Shadwell Park, and, acting on this suggestion, the First Commissioner approached the King Edward VII. Memorial Committee on the subject. At the same time the Committee stated that in the event of this suggestion not being acted upon, they would consider as to recommending the Council to accept the facade, provided the First Commissioner undertook to take it down and preserve it until a suitable site was decided upon. It was, however, found that the available area at Shadwell Park was too restricted to admit of the re-erection there of the portico and pediment, and this proposal had therefore to be abandoned.

The First Commissioner subsequently stated that the Treasury was prepared to authorise expenditure for the removal and storage of the materials upon the condition that the portico and pediment should be re-erected within a definite period, and he inquired whether the Council would accept this condition. The Committee reported on Tuesday that in the absence of a suitable site for the facade they had no alternative but to inform H.M. Office of Works that the Council, while greatly appreciating the offer of the First Commissioner and the Treasury, was unable to specify a date for the removal and re-erection of the portico and pediment. As the matter was urgent, they gave instructions for a letter in these terms to be addressed to H.M. Office of Works.

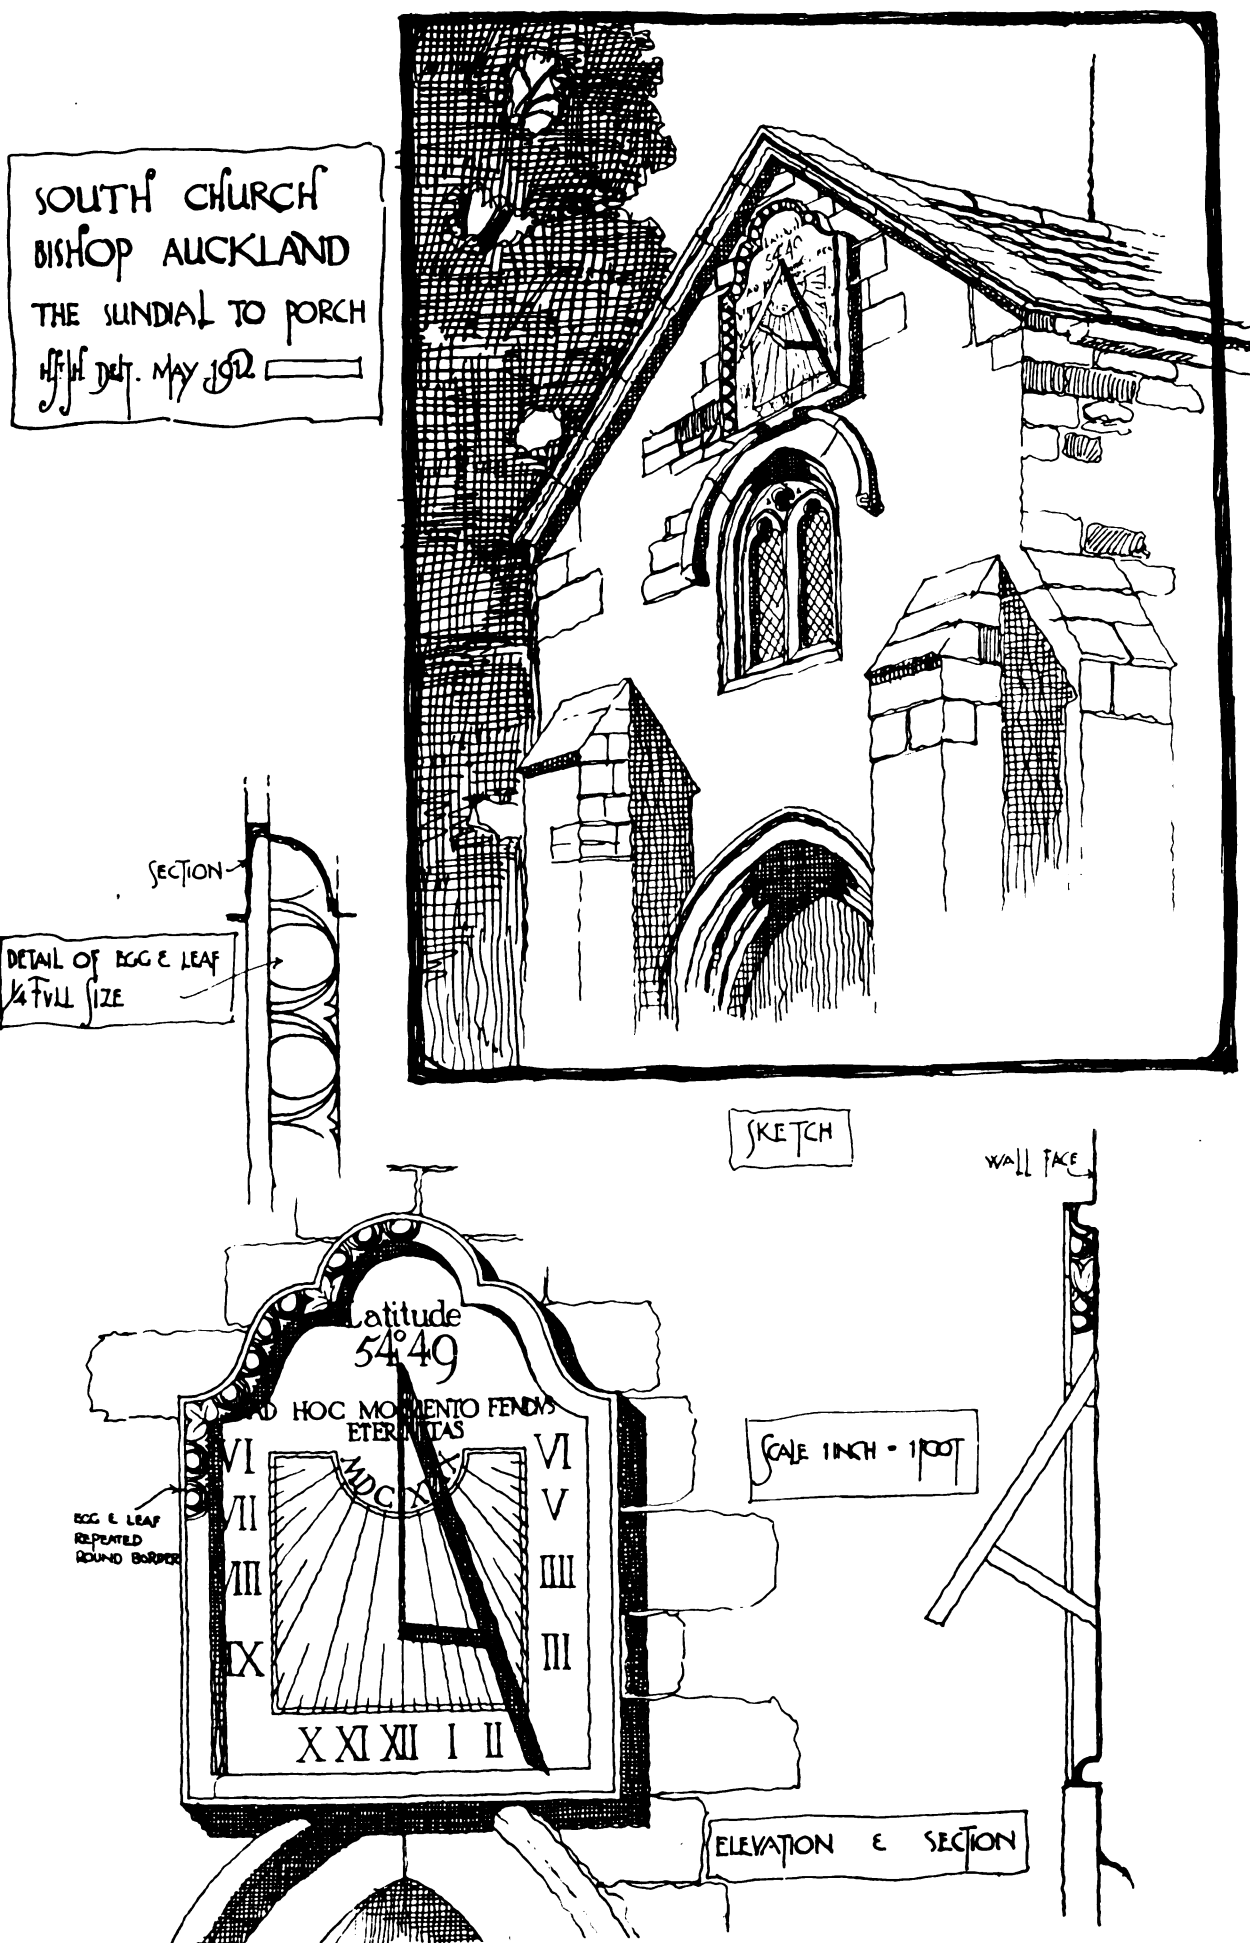

THE Corporation of Dublin have applied to the Local Government Board for Ireland for their sanction to loans of (1) £28,100, (2) £2,000, and (3) £4,000, for the purposes of (1) extending electrical cables and the electricity generating station buildings, (2) extending the underground public conveniences at Nelson's Pillar, and (3) acquiring property in Castle Street for municipal offices.

THE Glasgow Corporation Special Committee on Cottages for the Working Classes have instructed Mr. A. B. McDonald, the city engineer, to prepare a building plan for an area of twenty acres of the ground at Riddrie belonging to the Corporation, showing twelve houses to the acre, in terraces of eight on each side, being 240 in all. The houses are to be of the cottage type, and the rents are not to exceed £18 each.

THE Essex Education Committee, at their last meeting, adopted plans for the enlargement of the Council School, Laindon Hills, at an estimated cost of £2,160. Plans for the erection of a new infants' Church of England school, Brentwood, for 220, were approved, subject to one or two minor suggestions; and also plans for the addition of three new class-rooms and a cloak-room at St. Helen's R.C. School, subject to certain improvements in the lighting arrangements. The following tenders for the erection of new schools were accepted:—Mattock Bros., Wood Green, £4,117, South Chingford School for 300 infants; J. Rayner, East Hanningfield, £1,115 15s. 6d., Cold Norton School for 80; F. Hutton, £140, Frinton new handicraft centre; F. J. Coxhead, Leytonstone, £1,798, Woodford special instruction school.

WE recently received from Mr. J. E. C. Lord, of Borough Road, Weaste, Manchester, two samples of "Uleto" wood preservative. This liquid is obtainable in four shades of brown, two of green, and also in red. Each shade is manufactured in both exterior and interior qualities; the latter is much quicker in drying properties, and is free from objectionable odour. Some variety of finish is possible. Thus "Uleto," after being treated with a special priming solution, may with satisfactory results be varnished over or polished with beeswax or oil. Mr. Lord specially recommends the brown shades as being the most powerful preservative and antiseptic; they are also somewhat cheaper than the others. It is said that one gallon will cover about 450 square feet of hard planed wood. Any cheap preventative against dry rot is worth careful attention from architects, contractors, and building owners. "Uleto" is put forward as both useful and ornamental. Our sample shows it to be the latter; and past experience has proved it to possess the former quality.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

From a Drawing by Mr. H. St. J. HARRISON.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

BEDFORDSHIRE.

Bedford.—House, Bromham Road, for Miss Dawes.
Two houses, Honey Hill Road, for Mr. W. H. Izzard.
House, London Road, for Captain Brightman.
House, Priory Street, for Mr. F. Parrott.
No. 27 Tavistock Street: additions. Messrs. J. Corby & Son, builders.

CHESHIRE.

Ellesmere Port.—Picturedrome, Whitby Road. (Accommodation for 600.) Mr. H. P. Beckett, architect.
Frodsham.—Sunday school extension.
Tarporley.—Council (British) School: additions and alterations. Mr. H. Beswick, F.R.I.B.A. (of Chester), architect.

CORNWALL.

Camborne.—House. Mr. S. Hill (of Redruth), architect.
Lostwithiel.—Drill Hall for the County Territorial Force Association. Mr. O. R. Caldwell, F.R.I.B.A. (of Penzance), architect.
Porthleven.—Drill Hall for the Boys' Brigade and Scouts.

CUMBERLAND.

Worksop.—Church schools.

SHROPSHIRE.

Shrewsbury.—Drill Hall, Coleham, for the County Territorial Force Association. Mr. F. H. Shayler, F.R.I.B.A., architect.

SOMERSET.

Bruton.—King's School: additions and alterations. Mr. A. J. Pictor, A.R.I.B.A., architect.
Taunton.—Picture Palace and theatre (for 1,100 sittings). Messrs. Stone (A.R.I.B.A.) & Lloyd, architects.

STAFFORDSHIRE.

Biddulph.—Central Council School enlargement, 110 places.
Brierley Hill.—Moor Street Council School: infants' department for 350 places.
Dorey.—Church Room.
Leek.—Twenty-one houses, Spring Gardens. Messrs. Bayley & Morris, builders; also
Houses off Shirley Street.
Lichfield.—Board of Guardians' Offices (£1,000).
Stafford.—Headquarters, Bailey Street, for the 6th Staffordshire Battery, R.F.A.
Diocesan Library and Vestry, St. Mary's. Mr. A. B. Jackson, F.R.I.B.A. (of London), architect.
Stoke-upon-Trent.—Dispensary, corner of Victoria and Shirley Roads.
Council School, Penkhull: extension.
Tamworth.—St. John's School: enlargement.

SURREY.

Chertsey.—Girls' Secondary School.
Croydon.—Church of St. Michael and All Angels, Poplar Walk: Tower. Messrs. Luscombe & Son (of London), contractors.
Hall, Whitgift Street: additions for Mr. W. T. Taylor.
Twelve houses, Ederline Avenue, for Messrs. W. Aston & Co.
House, 25 Melville Avenue, for Mr. K. J. Young.
Six houses, Strathyre Avenue, for Mr. J. E. Trimble.
Three houses, Woodside Green, for Mr. P. Richardson.
Six houses, Pollards Hill West, for Mr. O. Gray.
Three houses, Clyde Road, for Mr. C. H. Gibson.
Seven houses and shops, Lower Addiscombe Road, for Mr. C. Taylor.
Three houses, Teevan Road, for Mr. R. B. Manser.
Mission Hall, Boston Road. Mr. E. J. Saunders, contractor.
Vicarage, Elmwood Road. Messrs. W. Smith & Sons, contractors.
Fire station, Brigstock Road, Thornton Heath (£7,500). Borough engineer.
Carnegie Branch Library, Brigstock Road, Thornton Heath.
Frensham Common.—Pumping station for the Wey Valley Water Co.
Guildford.—"Astolat," Semaphore Road: additions for Mr. W. G. Clarke.
"Lorelei," Weston Road: additions for Mr. A. Messenger.
House, Wodeland Road, for Messrs. Rutter & Co.
Municipal Offices, Tunsgate. Mr. C. G. Mason, Borough surveyor.

WARWICKSHIRE.

Erdington.—Council Elementary school, Ryland and Bracebridge Roads (for 1,200 places).
Council Special School, Bristol Street (£4,750).

WESTMORLAND.

Tebay.—L.N.W. Railway Co.'s station.

ENGLAND—continued.

WORCESTERSHIRE.

Dudley.—Great Hospital: extensions (£10,000).

Worcester.—School for 420 places, St. Paul's (£3,400).

Messrs. A. H. (F.R.I.B.A.) & A. G. Parker, architects.

Messrs. J. & H. Stokes, contractors.

YORKSHIRE.

Bradford.—Board of Guardians: Children's Home, Thackley. Mr. F. Holland, architect.

Conisburgh.—Parish Church: restoration and improvement (£2,200).

Goole.—(Supp. to Nov. 15.)—Workhouse: additions and alterations. Messrs. Thorp & Turner, architects. Messrs. Jackson & Oates, contractors (£4,100).

Harrogate.—Royal Pump Room: annexe (£2,700).

Tinsley.—Council School, Plumpers Road: alterations and extensions. City architect of Sheffield.

Whitby.—Villas, Dunsley Lane. Mr. G. S. French, architect.

WALES.

Cardiff.—Offices for the Insurance Act Commissioners, the Labour Exchange, &c. (£70,000 to £80,000).

Houses, Auchinairn Road. Messrs. J. Marshall & Sons, builders.

Electrical engineering works, Broad Street, Mile End: additions for Messrs. Mavor & Coulson, Ltd.

Phoenix Cabinet Works, London Road, Parkhead: additions for Messrs. J. Walker & Sons.

Picture Theatre, Shettleston, for Mr. G. A. Scott.

Lochwinnoch.—Sanatorium (King Edward Memorial).

Montrose.—Villa, The Mall, for Mr. A. Hurry (£900).

Newtonmore.—Public Hall (£1,300). Separate trade contractors.

IRELAND.

Granard.—Twenty-four working-class lodging houses (£3,400).

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 19,853. Sept. 6, 1911.—Date claimed under International Convention Sept. 6, 1910. Improvements in hollow reinforced-concrete floors, ceilings, and the like. Emile Klée, 12 rue de la Pepiniere, Brussels. This invention consists in constructing a hollow concrete floor or ceiling with concrete beams, with inclined struts connected together by transverse iron rods located in cuts or recesses provided in the beams, and the beams and transverse iron bars are fastened together by means of wire twisted round the beams and rods. Fig. 1 is a perspective view of the reinforced-concrete beams for forming the floor and the ceiling. Fig. 2 is a perspective view of the reinforced-concrete beams made capable of receiving nails with differently applied accessories for forming the ceiling and the floor. The reinforced-concrete beams, A, of the form shown are moulded with struts, A¹, on each side of a web, which struts are inclined outwards towards the right on one side and towards the left on

the other side. A braced beam is thus formed. The beams have reinforcing rods for increasing their strength by taking up the tension and shearing-stresses, and transmitting the weight of the load to the walls. In forming a floor the beams are joined together laterally by rods, o, located in recesses provided in the beams, and fastened to the beams by means of wires lying in recesses provided in the flanges of the beams. The concrete flooring, c (fig. 1), is cast or arranged on an arched slab, b, serving as a support, and resting between the

Fig. 1.

Fig. 2.

beams, A, or on a suitable centering, which is subsequently removed. The concrete ceiling is formed correspondingly to the floor or by means of the flat slabs, d (fig. 1), and i (fig. 2), or cast upon centering, as at f (fig. 1) and k (fig. 2). The upper and lower parts, g and h, of the reinforced-concrete beams, A, in fig. 2, are made capable of receiving nails. They thus replace wooden girders. Thus planks or boards, m and l, can be nailed on to the parts g and h. The material for receiving the nails is composed of one part of cement, two parts of hot asphalt powder, half part of shavings, which elements are moistened with water containing 52 per cent. of kaoline, and the whole is rammed. Sept. 18, 1912.

PATENT SPECIFICATIONS PUBLISHED
NOVEMBER 28, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 17,563. Aug. 2, 1911.—F. R. G. Richards, 10 Meriden Street, Coventry. Treatment of iron or steel for preventing oxidation or rusting.

21,763. Oct. 3, 1911.—Samuel Elliott, Silverdale, Henley Road, Caversham, near Reading. Process and appliances for drying or seasoning timber.

17,782. July 31, 1912.—Otto Wetzel and August Kuntz, 2 Romerstr., Heidelberg, Germany. Automatic lubricating apparatus for elevators, conveyors, and the like.

1,296. Jan. 16, 1912.—C. A. Muller, Gelsterstr., Witzhausen, Germany. Locks.

10,498. May 3, 1912.—F. A. Homer, 109 Gower Street, London. Tap for water, steam, or other fluids.

THE Portland cement industry of New South Wales has been marked by a steady growth during the past ten years. In 1902 the value of the cement production was £46,500; in 1911 it amounted to £315,569—an increase of £64,459 over the total for the preceding twelve months. The Commonwealth Portland Cement Co., Ltd., is the chief producer; but large quantities are also manufactured by Messrs. Goodlet & Smith, Ltd., at their Granville Works. The lime manufactured during 1911 was 29,930 tons, valued at £32,918.

VARIETIES.

THE late Mr. George Wilson, F.R.I.B.A., of 19 Broadburn Terrace, Edinburgh, left personal estate valued at £30,405.

THE Public Works Committee of the Birmingham Corporation have been authorised to reconstruct the railway bridge in Witton Road at an estimated cost of £4,500. The present brick-arch bridge will be replaced by one of girders.

THE Belfast Master Builders' Federation on Monday sent a deputation to attend the meeting of the Belfast Corporation, when a protest was made against the growing tendency to carry out important municipal works by direct labour.

THE Tynemouth Education Committee is about to appoint an architect or architects for the erection of one or two new elementary schools, and invites applications by Tuesday next, the 10th inst., for appointment from architects living or practising within a radius of 12 miles from the borough of Tynemouth; the engagement will be at the usual rate of commission.

THE special committee of the Nottingham City Council appointed to consider the future of the borough architect's department has recommended that Mr. Arthur Dale, the present assistant city architect, be appointed city architect at a salary of £450, and that Mr. F. B. Lewis, the retiring city architect, be retained as consulting architect at £250 per annum.

THE first annual staff dinner of Messrs. Bovis, Ltd., building contractors, of Upper Berkeley Street, W., took place on Saturday last, the 30th ult., at the Victoria Mansions Restaurant, S.W., when a company fully representative of the building trade and its various branches assembled under the chairmanship of Mr. Josephs, one of the founders of the firm, who was supported by his fellow-director, Mr. Gluckstein. Messrs. Bovis are a young firm, but, judging by the sentiments uttered during the evening, they bid fair to become a power in the building world in the not far distant future.

TRADE NOTES.

MESSRS. SIEMENS BROTHERS' DYNAMO WORKS, LTD., have obtained a renewal order for the supply of "Wotan" pure-drawn Tungsten lamps for the whole of the street lighting for the Brighton Corporation during the next twelve months.

UNDER the direction of Mr. Lloyd Roach, A.M.I.C.E., surveyor to the Urban District Council, Tredegar, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Council Chamber, Tredegar.

MESSRS. OETZMANN & Co., LTD., 67-79 Hampstead Road, W., are making their customary display of Christmas and New Year gifts. Being complete house furnishers, the firm open a wide field of choice to their customers. If a personal visit to the large showrooms is impossible, application should be made for their illustrated catalogues.

H.M. TRADE COMMISSIONER for Canada reports to the Board of Trade that a firm at Montreal, who state that they have business connections with architects and builders in that city, are desirous of obtaining agencies to cover Montreal and Quebec of British manufacturers of builders' supplies, such as architectural terra cotta, firebricks, tiles, steel window sashes, &c. The name and address of the firm may be obtained by British manufacturers on application to the Commercial Intelligence Branch, 73 Basinghall Street, London, E.C. Any further communications should be addressed to H.M. Trade Commissioner for Canada, 120 Board of Trade Building, Montreal.

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Fails-worth, Manchester, have recently supplied their warm-air ventilating patent Manchester stoves with descending smoke flues to the Melbourne Road Schools, Cambridge. Among the firm's other contracts are the following: The Tredington Isolation Hospital, Glos., is being supplied with double-fronted Manchester stoves with descending smoke flues, Manchester grates, patent exhaust-roof and inlet ventilators; the new Infectious Diseases Hospital, Thornton, Fife, is being supplied with Manchester stoves and grates; the new Billiard Hall and Picture Palace, Fleetwood, are being ventilated by patent exhaust-roof ventilators; and the Festiniog Urban District Council Assembly Rooms and the Electric Palace of Varieties, Belper, are being ventilated by means of Shorland's exhaust-roof ventilators and patent hygienic inlet ventilating panels.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 ls. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

JAMAICA.—Jan. 31.—The Mayor and Council of Kingston offer a prize of £100 for a design for municipal buildings (suitable for construction in reinforced concrete) to cost not more than £9,000. Charge 2s. For information apply to Messrs. Alexander Young (London), Ltd., 60 Fenchurch Street, London, E.C.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

CONTRACTS OPEN.

ALTRINCHAM.—Dec. 30.—For erection of shelter and conveniences at the recreation ground, Broadheath, in accordance with revised plans. Mr. H. E. Brown, surveyor, Town Hall, Altrincham.

Every reader will at once admit that the Fireplace is the centre of attraction in nearly every room, and for this reason both Architects and Builders pay great attention to the choice of a Fireplace suitable in character and design for the room they have built.

We want to convince Architects that they will be quite safe in specifying "The Carter Fire," and we also want to show Builders by our book of Fireplace Designs that we can fulfil their requirements, no matter what they may be. This book should be in the hands of every Architect and Builder in the country, and we will gladly send it free and carriage paid to any address on application.

The "Carter Fire" Corfette Design.

CHRISTMAS, with its holly, mistletoe, and yule log, is essentially the "home holiday" of the year, and in these days of expeditious and comfortable travel the unfavourable weather conditions need not exclude any who may wish to join the family circle at this festive season. We have just received a copy of a most attractive programme issued by the Great Central Railway Company. It is intended for those who are spending their Christmas in the Midlands, Yorkshire, Lancashire, Lincolnshire, or North of England. On Tuesday, December 24, special expresses will leave Marylebone at suitable times for over 500 different stations. The tickets issued at extremely low fares will be available for return on the following Thursday, Saturday, or Tuesday, enabling those who may so desire to spend the special holiday period with their friends. Luncheon or restaurant cars will be attached to the principal trains, and the compartments represent the acme of comfort, being well-lighted and maintained at a genial temperature. Shopkeepers and others whose business may keep them in town until late on Tuesday evening will have the advantage of suitable night trains. Copies of this Christmas holiday programme can be obtained free at Marylebone Station, G.C.R.

REGISTRATION OF PLUMBERS.

A MEETING of London plumbers was held this week at King's College, Strand, when a lecture was delivered by Mr. J. W. Hart, R.P., foreman to Messrs. Dent & Hellyer, of Red Lion Square, on "Modern Sanitary Appliances." The chair was occupied by Mr. H. D. Searles-Wood, F.R.I.B.A., who attended in his capacity of Chairman of the Managing Committee of the General Council for the National Registration of Plumbers, and represented the interest taken by the architectural profession in the registration of plumbers, as a means of distinguishing those who have given satisfactory evidence of their qualification, and are, by the conditions of their enrolment, made individually responsible for the efficiency of their work.

The lecturer described in detail, and illustrated by diagrams and sketches upon the blackboard, the principal points in the construction and objects of the various ancient types of sanitary appliances of which records have been preserved, and those in use at the present day.

The restriction in the use of valve closets in London was referred to in connection with regulations of the Metropolitan Water Board. These are under consideration by the London Council for the National Registration of Plumbers and Plumbers' Company.

The system of "marking" the work of registered plumbers which was adopted by the General Council at their recent conference in Bristol was described, and it was explained that by the system the identity of the master plumbers, or other employers who undertook plumbing work, and also the identity of the operative plumbers who executed it, would be recorded for the greater security of the public and the encouragement of good workmanship.

The following is a description of the mark: A copper label has embossed on it on the right-hand side in the space at the top the mark of the employers (an alphabetical letter or other sign), to distinguish each of their jobs whereon the system of marking is adopted. The number of each of the registered operative plumbers who executes the work appears in the space on the left side of the label. The words "Registered Plumbers' Work" appear below these marks.

The copper labels should be sweated on the pipes to distinguish the piece of work of each man, and the labels should be attached, where practicable, on the bench.

SUMMER SCHOOL OF TOWN PLANNING.

IN view of the success of the first Summer School of Town Planning held at the Hampstead Garden Suburb in August last, under the auspices of the University of London, it has been decided to hold a second Summer School next year at the same centre. It will last for a fortnight, commencing August 2, and continuing till August 16, and during that time lectures and demonstrations on town planning and subjects practically connected therewith will be given by some of the leading authorities. Last summer certificates were awarded to the students by the Extension Board of the London University, and a number of architects and engineers have already found these certificates of great advantage. Next year it is hoped that with the experience of the first Summer School the course will even be an improvement upon last year's. The Hampstead Garden Suburb, the 400 acres extension of which forms a great portion of the town planning scheme recently submitted to the Local Government Board by the Finchley District Council, makes an ideal centre for a study of this kind. The practical difficulties which town planners have to overcome can here be studied on the site as they actually occur, and the lectures are rendered of considerably more value by constant illustration of outdoor practice. The school will, as before, be specially adapted to the needs of municipal engineers, architects, and surveyors.

Particulars can be obtained upon application to the Hon. Secretary of the Summer School, Mr. J. S. Rathbone, The Institute, Hampstead Garden Suburb, London, N.W.

THE sole selling rights for Great Britain and Ireland for "Castor," the well-known preparation for rendering cement plastering waterproof, have been transferred to the "Castor" Waterproofing Co., 110 Fenchurch Street, London, E.C.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

THE VICARAGE at RYTON on TYNE.

THE SUNDIAL IN THE GARDEN "ALPHA" July 1912

From a Drawing by "ALPHA."

We are informed that the style of the firm of Mr. John Tann, 117 Newgate Street, London, E.C., has been altered to John Tann, Ltd. The works remain at St. Stephen's Road, Old Ford, E.

THE Berwick Town Council as the Sanitary Authority for the borough, have received the sanction of the Local Board to borrow £21,800 for the purpose of carrying out the joint water scheme for the three parts of the borough—Berwick, Tweedmouth, and Spittal.

THE Wimbledon Corporation have agreed to purchase the Wimbledon Park Estate, with its lake and lands adjoining, for the purpose of a public open space, at a cost of £65,000. Property owners in the vicinity will contribute towards the purchase money.

A Local Government Board inquiry was held at Stockport on Tuesday into an application by the Corporation for sanction to a loan of £15,000 required to extend the police buildings. The present scheme is the third to be prepared.

NEW CHIMES FOR CANADA.

MR. ROBERT WARNER, who has just returned from Canada after a journey of over nine thousand miles, informs us that Messrs. John Warner & Sons, of the Spitalfields Foundry, London, have been entrusted with the work of the installation of a chime of 13 bells for Fredericton Cathedral, New Brunswick, Canada. The chime will cost £2,000, which is based upon a 40-cwt. tenor, and the total weight will be about 9 tons.

The installation of another chime at Winnipeg, Ontario, has also been entrusted to Messrs. John Warner & Sons. Winnipeg is the most important city in Western Canada.

The chime will be composed of 15 bells, with a total weight of about 12 tons, and based upon a 50-cwt. tenor. The bells, which will cost nearly £2,500, are being given to the church by a lady in memory of her husband and son, who perished in the sinking of the *Titanic*.

THE L.C.C. Main Drainage Committee recommend the expenditure of £1,000 on the necessary preliminary work and the preparation of plans, &c., for a proposed enlargement of North Woolwich pumping station, at an approximate total cost of £51,000.

**BUILDING PROGRESS IN THE PROVINCES
AND SUBURBS.**

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.**CHESHIRE.**

Ellesmere Port.—Cemetery Chapel (£850).
Wilmslow.—Catholic Church (£3,000 to £4,000).

DERBYSHIRE.

Alvaston.—Council Offices.
Burton.—Church, Dale Road.
Creswell.—St. Mary Magdalene Church: enlargement by 300 places (£1,300).
Derby.—Elementary Council School for 800 places, Nightingale Road.
Long Eaton.—Four elementary schools off Station Road, for 1,200 places (£14,400).

DEVON.

Feniton.—The E.C. Schools: additions and alterations. Mr. A. J. Redfern (of Honiton), architect.

DORSET.

Poole.—Baptist Church, Hill Street: additions and alterations.
Chauffeur's Cottage, "St. Ann's," Canford Cliffs. Mr. R. W. Schultz (of London), architect.
House, Wimborne Avenue, for Mr. E. V. Wilson.
House, Cliff Drive, for Mr. S. Ward.
House, Cliff Drive, for Mr. R. Young.
House, Caledon Road, for Mr. G. H. Isaacs.
House, Danecourt Road. Mr. H. Kendall, architect.
House, Lyell Road, for Mr. H. Harding.
House, Marlborough Road, for Mr. H. Knight.

DURHAM.

West Hartlepool.—Swimming Bath.
Wheatley Hill.—Council School: alterations and improvements. Mr. N. Richley (of Durham), architect.

ESSEX.

Dunmow.—Police Station: extension.
Harwich.—Police Station (£6,000 to £7,000). County architect.

HAMPSHIRE.

Portsmouth.—Forty-three model dwellings, Portsea.

KENT.

Ramsgate.—Council School, Ellington Place. Mr. G. G. Tucker, architect.

LANCASHIRE.

Bacup.—Baptist Sunday School for 500 places. Messrs. Smith & Cross (of Rochdale) and Mr. F. P. Halsall, A.R.I.B.A. (of Southport), joint architects.
Bolton.—House, "The Clough," Chorley New Road, for Mr. A. T. Crook.
Six houses, Chorley Old Road, for Mr. A. England.
Six houses, Chorley Old Road, for Mr. J. Hardman.
House, Church Road, for Mr. R. McConnell.
House, Junction Road, for Mr. A. Thompson.
School for the Blind, off Marsden Road (£5,000).
Brightmet.—Six houses, Bury Road, for Mr. T. Woods.
Manchester.—Henry Watson Library, Piccadilly: extension (£500).
Rochdale.—Infirmary: additions and alterations. Messrs. Jesse Horsfall (F.R.I.B.A.) & Healey (of Manchester), architects.
Southport.—Picture palace, Nevill Street, for Mr. J. Baker.
Picture palace, Nevill Street, for Mr. B. Hanmer.
Picture palace, Walton Road, Birkdale, for Mr. A. Wade.

LEICESTERSHIRE.

Blaby.—Glen Parva brickworks: additions and alterations for an Oil and Meat Syndicate.

LINCOLNSHIRE.

Lincoln.—Two houses, Scorer Street, for the Lincoln Land and Building Society.
Eighty-three houses, Westcliff Street. Mr. J. M. Harrison, builder.
Vicarage, Newport, for the Rev. Canon Leeke.

MIDDLESEX.

Hendon.—(King Edward VII.) Memorial Cottage Hospital, Park Road.
Southall.—Elementary Council School.
Sunbury-on-Thames.—Public Elementary school: enlargement by 100 places.

MONMOUTHSHIRE.

Abersychan.—Council School, Pentwyn, for 500 places. Mr. J. A. Bain, F.R.I.B.A. (of Newport), County architect; also
Blackwood.—Council School, Libanus, for 600 places.

NORTHAMPTONSHIRE.

Northampton.—Fifty workmen's dwellings, Bective Estate, Kingsthorpe (£9,000). Mr. J. W. Gossage, contractor.

NOTTINGHAMSHIRE.

Mansfield.—Hospital (King Edward VII.) Memorial Wing.
Selston.—Council School.

SOMERSET.

Frome.—Infantry Drill Hall. Mr. W. J. Willcox (of Bath), County surveyor.
Taunton.—Twelve houses, String Lane. Mr. D. Edwards, A.M.I.C.E., Borough surveyor.

STAFFORDSHIRE.

Stafford.—Twenty (or more) houses for the working classes.
Stoke-on-Trent.—Church at Hartshill, Basildon (£5,000). Church Schools, Fenton (£5,000).
Council School, Oakhill.
Children's Hospital and Nurses' Home extension (£6,000).

SUFFOLK.

Ipswich.—Offices for the Sun (Fire) Insurance Co., Ltd. Mr. E. T. Johns, architect.

SURREY.

Byfleet, West.—Public Elementary School for 350 places.
Chertsey.—Sir William Perkins' School. Messrs. Jarvis (A.R.I.B.A.) & Richards (of London), architects.
Farnham.—Seven pairs of cottages, Weydon Hill Road, for the U.D.C. (£3,100).
Guildford.—Extension of premises, High Street, for Messrs. John Reeks.
Molesey.—Hotel, Theatre, Concert Room, &c., Tagg's Island. Mr. F. Matcham (of London), architect.
Reigate.—Police and Fire Station, London Road.

SUSSEX.

Lewes.—Sanatorium (£20,000). Mr. F. J. Wood, A.M.I.C.E., County surveyor.

WORCESTERSHIRE.

Rubery.—Pumping station
Stourport.—Electric theatre. Messrs. Pritchard & Pritchard (of Kidderminster), architects.
Worcester.—Council School, Skating Rink (Arboretum) site.

YORKSHIRE.

Alne.—(Supplementary to November 22.)—Wesleyan Sunday School. Mr. J. F. Todd (of Easingwold), architect.
Messrs. J. Allinson & Son (of Pocklington), contractors (£500).
Brighouse.—St. John's Church, Rastrick. Sir Charles Nicholson, Bart., F.R.I.B.A. (of London), architect.
Dewsbury.—Alterations in Bond and Grove Streets, for the Dewsbury and District Junior Unionist Association. Mr. W. F. Cave (of Heckmondwike), architect.
Sandsend.—Two villas, for Mr. T. Trattles.
Whitby.—Raithwaite Hall: wing for Mr. W. H. S. Pyman.
Garage for Mr. Walker, near the Royal Hotel Farm.

WALES.

Glyn Neath.—Cinematograph Theatre. Mr. M. H. Hunter (of Neath), architect.
Llanelli.—Public Hall.
Morriston.—Cinema Hall, Swan Road, for Messrs. Hopkins, Samuels & Co.
Swansea.—Cinema Hall, Worcester Place, for Messrs. A. Andrews & Son.

SCOTLAND.

Airdrie.—Police Station, Clarkston (£850).
Alyth.—Masonic buildings. Separate trade contractors.
Coatbridge.—School, Drumpellier Street and Bank Street corner, for 750 places (£7,000).
Edinburgh.—Cinematograph Theatre, Baxter's Place, Greenside (for 900 sittings).
Motherwell.—Public slaughterhouse: improvements (£1,000).
Paisley.—Seedhill Finishing Co.'s Cloth Works.
Rutherglen.—Works: additions for River, Bolt and Nut Co.

IRELAND.

Kells.—Town Hall (£1,000). Mr. Grace, architect.
Longford.—St. Mel's College: library and gymnasium. Mr. T. F. Macnamara (of Dublin), architect.

MESSRS. HARVEY, NICHOLS & CO., LTD., have recently rearranged their premises, including the reconstruction of the whole of their shop windows fronting to Knightsbridge, with returns in Seville Street and Sloane Street. Their old-fashioned and rather low sashes, with two irregular and awkward entrances, have given place to the new windows, very much higher than the old ones, formed of ornamental bronze mouldings and gunmetal ornaments with green marble fascia and plinth, the whole being a happy combination of commercial utility and artistic taste.

There is at either end of the new windows a large island window, with an entrance doorway in the angle at the back of same, whilst in the centre shaped windows lead into

two sets of folding doors, which are separated by a circular glass case with a domed glass roof, the whole forming an imposing and attractive feature. The total length of the new windows is about 350 ft. run. Inside the windows, at a distance of 7 ft., is a mahogany screen, glazed at top with fire-resisting copper glazing.

The new shop-front has been made and erected by Messrs. Harris & Sheldon, Ltd., of Birmingham, and 70 Wood Street, London, the shop-fitters, who are also responsible for a large quantity of new mahogany fittings and mahogany, bronzed and plate-glass counters. The work has been designed and carried out under the entire supervision of Mr. F. E. Williams, A.R.I.B.A.

PATENT SPECIFICATIONS PUBLISHED DECEMBER 5, 1912.

Selected by James D. Roots, M.I. Mech.E., Thanet House Temple Bar, London.

No. 24,707. Nov. 7, 1911.—John Gunning, 100 Holden-hurst Road, Bournemouth. Apparatus for lighting and extinguishing lights at predetermined times.

24,936. Nov. 9, 1911.—Myer Coplans, 8 Ashwood Villas, Headingley, Leeds. Apparatus for purifying water or other liquids.

25,031. Nov. 10, 1911.—A. J. Caldwell, 92 Lower Bridge Street, Chester. Fire and temperature alarm.

25,287. Nov. 14, 1911.—John Todd, 20 Dumbarton Street, Liverpool. Construction of chimney pots, chimney cowls and ventilating terminals.

29,168. Dec. 28, 1911.—John Shanks, Tubal Works, Barrhead, Renfrew. Ball cocks.

813. Jan. 10, 1912.—J. C. Hamilton, Sutton, Ferrybridge, Yorkshire, and T. W. Wheatley, of Brotherton, Ferrybridge, Yorkshire. Apparatus for filtering, cleansing, and purifying water, &c.

1,556. Jan. 19, 1912.—J. Erskine-Murray, 34 Norfolk Street, W.C., and F. R. Trevithick, King's Road, Mount Eden, Auckland, N.Z. Apparatus for measuring angles.

4,658. Feb. 24, 1912.—J. M. Goodrich, "Ashleigh," Woodthorpe, Nottingham. Revolving oven shelf.

5,541. March 5, 1912.—Moritz Schitzkowsky, 53 Colnerstr., Dusseldorf, Germany. Process for the manufacture of collars or other thickened portions of pipes and similar hollow bodies.

8,488. April 10, 1912.—Date claimed under International Convention. Otto Rehnitz, 1 Kaiserstr., Cottbus, Germany. Lathing or plaster supports capable of being rolled up, and in the process for their manufacture.

9,114. April 18, 1912.—Oswin Hansom, 16 Tithebarn Street, Liverpool. Water heating apparatus.

13,789. June 12, 1912.—Date claimed under International Convention June 17, 1911. J. Ravaisson-Mollien, 61 Rue d'Auteuil, Paris. Flushing mechanism for water cisterns.

13,926. June 15, 1912.—Anton Gasparich, West Oakland, Alameda, California, U.S. Flexible rollers for drawing curves.

17,497. July 27, 1912.—H. D. Hope, 55 Lionel Street, Birmingham. Closing windows and the like and devices therefor.

10,038. April 27, 1912.—Arthur Haywood, Gabbary Works, Egyptian State Railways, Alexandria, Egypt. Window fastener.

10,088. April 29, 1912.—Joseph Southall, Worcester Foundry, Worcester. Fall-bars for cooking ranges.

10,141. April 29, 1912.—J. McCulloch Ross, Lucan, Middlesex, Ontario. Means for completing and economising the combustion of fuel in stoves.

11,332. May 13, 1912.—P. L. Bryning, 26 Linden Place, Brookline, Norfolk, Mass., and E. L. Brown, 17 King Street, Lynn, Mass. Sectional shelving.

12,153. May 22, 1912.—Date claimed under International Convention May 26, 1911. F. Vereycken, 19 rue du Couloir, Brussels. Flushing cisterns.

DUNFERMLINE TOWN Council, at their monthly meeting on Monday, had before them an application to erect 70 dwelling-houses on a site in the area proposed to be town-planned by the burgh. The convener of the Town-Planning Committee moved that the plans be held over until the Local Board had sanctioned the Council's final plan for the laying out of the ground. He said that if the Council granted authority they might be held liable for compensation in the event of the buildings not conforming to the town-planning scheme as approved by the Board. The Council, in consequence, postponed consideration of the plans until March or April.

EFFECTS OF TOWN AIR ON METALS.*

EVERYONE has noticed the more prominent of these effects in the occurrence of tarnishing and disfigurement, but a third more deep-seated one, often of greater importance—namely, corrosion—frequently escapes observation. The phenomena are partly mechanical and partly chemical, and their causes may be classified as follows, noting that they will, in a large number of cases, act conjointly. The order is taken in time-sequence, as they usually come into operation.

1. Direct action on the metallic surface of certain gaseous impurities in the air.
2. Deposit of a carbon layer from the soot.
3. A greasy coating from hydrocarbons which attracts dust.
4. A corrosive film from acid vapours.

The second and third, or mechanical causes, greatly obscure and disfigure a bright metallic surface, but do not of themselves corrode it; in fact, a hydrocarbon layer would, as is well known, actually form a protection, if it were uniform. But, unfortunately, it is not, and only gathers in drops and smears, and the metal becomes, in consequence, mottled and unevenly affected. Simple soot due to almost pure carbon is easily detachable, and it is only when the brown adhesive hydrocarbon soot is present that it is more difficult to clean. On the other hand, the deposition of the combined carbonaceous coating involves an immense amount of labour in removal, the tarry matters derived from the imperfect combustion of coal being the main difficulty. The remedy for the evil is obviously the prevention of smoke by a complete and economic combustion in grates and furnaces. This will be reverted to later.

In reference to the first cause given, the direct action on metallic surfaces of gaseous impurities, there are districts in manufacturing towns (including London) where hydrochloric acid, spray, or dust from various chemicals, ammonia or sulphuretted hydrogen are emitted from the works. But away from these, the last-named gas is continually occurring in towns, derived from the incomplete combustion of coal in domestic grates, sewers and putrefaction, emanations from human beings, or accidental leakage of unpurified coal gas accounting for smaller quantities. It is hardly necessary to mention the tarnishing and blackening effect on nearly all metals.

Sulphuretted hydrogen requires special attention as the only ordinary gas which attacks silver, and, apart from the expense of continually cleaning with whitening or other polishing agent, there is a constant loss of the precious metal in the removal of the film of silver sulphide, a loss that might be calculated from the gradual thinning and reduction of weight of silver articles in time, and would amount to a very serious aggregate. In silversmiths' shops it is avoided, at another expense, by encasing the window, but when taken out and exposed to town air the articles rapidly tarnish.

Aluminium is unaffected by sulphuretted hydrogen itself, but, on the other hand, is susceptible to chloride vapours, to many acids, and to alkalis which may be used for cleaning. In spite of its valuable qualities for domestic application, it is not invulnerable against town air.

Copper and brass are particularly sensitive to attack by sulphuretted hydrogen. A familiar example is the rapid darkening of copper or bronze coinage, the coating being mainly sulphide. Although the cause may be mainly due to human exhalations, there is no doubt that copper or brass surfaces remain bright longer in the country than in towns, and this has a special interest to tradesmen on account of the collectively immense area of brass exposed on shop name-plates, which require with constant labour to be kept immaculate.

Ammonia, also present in small quantity in the air of towns, can also attack copper or brass, and with the aid of atmospheric acids can form the green or blue incrustations which are commonly called "verdigris."

These actions are intensified generally or locally if the active impurities are condensed by soot, or brought down by rain; and not simply tarnishing of the surface, but actual corrosion of the body of the metal, may be occasioned. Some analyses of London soot collected from glass roofs in dry weather gave in percentage averages: Carbon, 39 to 43; hydrocarbons, 5 to 14; sulphuric acid, 4; hydrochloric acid and ammonia, each about 1; the rest being mineral matter containing oxide of iron, with some moisture. There is not sufficient ammonia to neutralise the sulphuric and hydrochloric radicles, therefore such soot is acid in reaction.

* A Paper by Dr. S. Rideal, D.Sc., F.I.C., prepared for presentation to the International Smoke Abatement Conference at the Agricultural Hall, London, N

Samples of soot in Glasgow have contained as much as 7.9 per cent. of SO_2 . In the elaborate and valuable research under the auspices of the Coal Smoke Abatement Society, reported in the *Lancet* of January 6, 1912, under the title of "The Sootfall of London," observations are published for the year from June 1910 to June 1911, made at three stations in London and one on the borders of the metropolitan area at Sutton, Surrey. They show that the deposit is greater in the City area, amounting to about 650 tons per square mile, that in the south-western district it was 460 tons, and at Sutton 195 tons, the maximum fall being generally in the late autumn, the period of fogs. In the S.W. district the insoluble deposit, mainly soot, was less, on the whole, than that which fell in the City, and in the suburban area typified by Sutton it was only about one-sixth of that in the metropolis. The soluble matters deposited included ammonium and calcium salts, sulphates and chlorides, and some organic constituents, among which acetic acid was certain to have occurred; the quantity of soluble matter in the suburban district was again less. Particular attention is drawn to the sulphate figures, "inasmuch as most, if not all, of the sulphur found in rain may be traced to the combustion of coal or gas." The City area receives nearly double as much sulphate as the S.W. district, while in the suburban area there was often only a trace, and sometimes none. Ammonia is a product of the faulty combustion of coal; coal gas is free from ammonia, and yields none on burning. The amount in the S.W. district is three-fourths and that at Sutton one-twentieth of that in the City. It is stated that rain in the metropolis is rarely acid, in spite of its load of impurities, while in Leeds, Glasgow, and Manchester acidity is constantly reported. This is attributed to the comparatively less development of factories in London as a whole, and also to the fact that domestic fires tend to make the smoke alkaline from ammoniacal tarry compounds.

(To be concluded.)

VARIETIES.

THE Lincoln Board of Guardians on Tuesday agreed to purchase nine acres of land near the barracks as a site for a workhouse which it is proposed to erect at a cost of £20,000.

THE Bromsgrove Board of Guardians have appointed a committee to report upon the question of building upon the workhouse land, with instructions to engage an architect to prepare plans and estimate.

MR. H. W. PEARCE, who has been assistant borough surveyor at Worthing for some four years, has been appointed surveyor to the Urban District Council of Swanage. As a parting gift the Corporation staff have presented Mr. Pearce with a gold watch.

THE Smethwick Education Committee have this week approved the plans of the proposed Smethwick Halls Schools. The buildings are laid out on the one-storey plan, and, in addition to the ordinary school premises, there are a manual training centre to accommodate 40 boys, a private room for the assistant school medical officer, a room in which medical inspections can be carried out, and a room which can be utilised later as a school clinic. The suggested open-air school was abandoned as being too costly.

THE Asylums Committee of the London County Council recommend that the erection of the Maudsley Hospital at Denmark Hill should be proceeded with, subject to the approval of the necessary plans by the Secretary of State. The final estimate of the cost of the buildings by the asylums engineer is £48,000 for 108 beds, or £444 8s. 10d. per bed. The additional cost of equipment is estimated at £8,000.

It was stated at the last meeting of the Whitley Urban Council that the harbour improvement engineers, Messrs. Sandeman & Sons, of Newcastle, had been instructed to prepare plans for additional fish quays, in connection with the harbour improvement works, which are being carried out by Messrs. W. Hill & Co., London, at a cost of about £60,000. The Council has power to expend £75,000, including a Treasury grant of £24,400.

THE tender of Messrs. Quibell, Sons & Co., Ltd., Hull, amounting to about £33,000, has been accepted for the erection of the "Dr. Lee Rest Homes" at Hull. They will be built on the Anlaby Road, and will provide accommodation for seventy-five single persons and forty married persons. The architect for the scheme is Mr. H. T. Hare, F.R.I.B.A. Dr. Lee, who died in January last, left £195,246, which, with the exception of £11,000, will be devoted to founding the Rest Homes.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

CHRISTMAS HOLIDAYS.

All alterations or fresh copy for advertisements for the next issue must reach us by Monday morning next, the 23rd inst.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 1s. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

HEMEL HEMPSTED.—Jan. 31.—The Town Council invite competitive designs for a housing scheme comprising 25 houses. Premium offered £20. Printed conditions and plan of site may be obtained on payment of £1 1s. deposit, which will be returned on receipt of bona fide designs on or before January 31. Send application to the Borough Surveyor, Town Hall, Hemel Hempstead.

HAYTI.—Feb. 4.—The Acting Consul-General at Port-au-Prince reports the announcement in the *Moniteur* of a competition of designs for a national palace at Port-au-Prince. Plans will be received by the "Département des Travaux Publiques," Port-au-Prince, up to Feb. 4, and prizes of \$500 (about £103), \$250, and \$200 will be awarded. The building and furnishing of the new palace, is expected to cost about £80,000. The *Moniteur*, containing further particulars, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

JAMAICA.—Jan. 31.—The Mayor and Council of Kingston offer a prize of £100 for a design for municipal buildings (suitable for construction in reinforced concrete) to cost not more than £9,000. Charge 2s. For information apply to Messrs. Alexander Young (London), Ltd., 60 Fenchurch Street, London, E.C.

LANCING.—Sketch plans are invited for church accommodating 500 people, to be erected in South Lancing, to cost, when completed, from £4,000 to £5,000. Communications to be sent to the Secretary of Building Committee, Rev. E. Peel, Lancing Vicarage, Worthing.

NEWCASTLE-UPON-TYNE.—The Education Committee invite from architects practising in Newcastle competitive plans for elementary schools at (a) Rye Hill, and (b) Crudas Park. Apply to the Secretary, Education Offices, Northumberland Road, Newcastle-upon-Tyne.

WELLINGTON (SALOP).—The Urban District Council invite competitive designs for houses to be let at 3s. to 3s. 6d. a week. A prize of £10 10s. will be given for the design most approved by the Council, and the plans for which such prize is awarded shall become their absolute property. No undertaking is given or to be implied that the architect submitting such plans will be employed to carry out the work, or that the scheme or design will be carried out. Mr. J. W. Littlewood, Clerk, Bank Chambers, Wellington, Salop.

CONTRACTS OPEN.

ALTRINCHAM.—Dec. 30.—For erection of shelter and conveniences at the recreation ground, Broadheath, in accordance with revised plans. Mr. H. E. Brown, surveyor, Town Hall, Altrincham.

The Education Architect County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

THE INSTITUTION OF CIVIL ENGINEERS.

THE highest marks in the October Associate Membership Examination have been obtained by Mr. C. Quartanos, of Newcastle-on-Tyne, and Mr. H. Knowler, of Sutton, Surrey.

The Council have accordingly directed that Mr. Quartanos, who is ineligible for the Bayliss prize by reason of his not being a present or former student of the Institution, receive honourable mention, and that the prize—of the value of £15—be awarded to Mr. H. Knowler, Stud.Inst.C.E., under the conditions of its foundation.

THE proprietors of Ronuk Sanitary Polish have had the honour to receive a Royal Warrant of Appointment to her Majesty Queen Alexandra.

A NATIONAL Gas Exhibition is to be held during October next at the White City, Shepherd's Bush, London, under the presidency of Mr. Corbett-Woodall. It will be in commemoration of the jubilee of gas engineers and centenary of gas supply. This Exhibition has been organised by a Joint Committee representing the Institution of Gas Engineers, the Society of British Gas Industries, the British Commercial Gas Association, and the municipal and private gas undertakings of the United Kingdom. A special section of the programme is to be devoted to the hygienic and economic aspects of good and bad illumination. Model rooms, lighted by various methods, will be on view, and lectures delivered.

THE President of the Edinburgh, Leith and District Building Trades' Association, ex-Bailie Forrest, speaking at their annual dinner last week, said he was convinced that they were about to have a revival of trade—he would not say a "boom," but if they got good, steady business it would be better than a "boom."

MR. RICHARD NORMAN SHAW, R.A., of 6 Ellerdale Road, Hampstead, Middlesex, architect, left estate valued at £104,627 16s. 4d., with net personalty £99,461 2s. 6d. Testator gave £300 and all the household effects to his wife, and while a widow the use of his house. The residue of his property he left as to one-seventh to his son William Campbell Shaw, one-seventh in trust for his daughter Elizabeth Ellen Shaw, known as Sister Elizabeth Ellen, for life, and then to his two sons, and four-sevenths to his wife during widowhood, or the income from £10,000 should she re-marry, and subject thereto for his two sons.

MESSRS. STEWARTS & LLOYDS, LTD., iron and steel tube manufacturers, desire to feu 16 acres of the lands of Riddrie fronting Cumbernauld Road from the Glasgow Corporation for the purpose of erecting there large engineering works, the machinery in which would be operated by electric power.

MESSRS. KING & ARNELL, LTD., builders, have offered the London County Council a rent of £2,000 for a lease for ninety-nine years of a site in Kingsway, having an area of about 8,000 feet and frontages of 80 feet and 80 feet to Kingsway and Kean Street respectively. The offer is made subject to the condition that for a period of six months the lessees shall be granted the first refusal of a lease, at a corresponding rent, of an adjoining site of equal area.

A NEW ASPHALTE FACTORY.

ALMOST half a century ago Messrs. Engert & Rolfe, Ltd., established themselves on the site of their present works in Poplar—their first place, in 1854, was, however, at Millwall. In the earlier years the reputation of the firm was built up by the excellence of their external roofing, underslating, and, above all, hair felts. But an energetically-managed concern is always on the look-out for opportunities of development and fresh fields to conquer. Messrs. Engert & Rolfe found a promising opening in the direction of natural rock asphalt work. This they followed up with such success that it recently became necessary to erect at the works at an expense of some thousands of pounds an asphalt factory and bitumen refinery. The plant has been specially designed by the most competent, if not the only, specialist in this country, and it embodies certain improvements which in combination cannot probably be found in any other similar plant. The visitor—and visitors are welcome—will be afforded an object-lesson in compactness, and in addition he will receive a graphic lesson in the production of asphalt under the most up-to-date conditions.

The factory lies alongside a canal, on which is conveyed the raw material: the asphalt rock from Sicily, France, and the Limmer Mines of Hanover, and the crude bitumen from the renowned Pitch Lake of Trinidad. The bitumen is first refined and then used as a flux in exactly-gauged proportions to the asphalt rock. This rock is broken by hand to the size of a man's head before being placed in the crushers, where it is broken to the size of walnuts. Next it is conveyed by elevators to the hoppers, from which it descends to the disintegrators for reduction to powder. This powder is then elevated to the top of the building to the screening chamber, the fine powder falling down to a two-way hopper, while the unpowdered pieces automatically return to the disintegrators. This powder is bagged and wheeled direct to the cookers. When sufficiently cooked the asphalt is drawn off and moulded into the usual cakes or poured into the caldrons or "locos" for conveyance to the job.

Messrs. Engert & Rolfe pride themselves on having excellent men, excellent materials, and now an excellent plant. Even with their former plant they built up a high reputation. For instance, they are the triennial contractors to the War Office, and have executed a considerable amount of work for the Office of Works and the London County Council (they are at present engaged upon the asphalt to the new County Hall, Westminster), and can show lists of works executed and in course of execution all over the country. The firm are now in a position to beat all their previous records and to make their name as widely known for asphalt work as it has long been for felts.

THE York Corporation are in negotiation for the purchase of 12½ acres of land, lying between Fulford Road and the river. It is proposed to utilise the front portion for extending the tramways depôt, the centre portion for an open-air school and a school for defectives, and the rear portion for allotments.

ARKLOW Urban District Council invite the services of a competent engineer to recommend (1) the most suitable water supply from a number of given sources, and (2) to give approximately the estimated cost of procuring same. Applications, which must specify fees required, will be received up to January 4.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

From a Drawing by "AVEC BEAUCOUP DE PEUR."

ENGLISH TIMBER: ITS MARKETS, VALUE AND PRODUCTION.*

THE subject of English timber is a wide one, and I intend to review the question of the marketing, value and production of timber in its widest application.

I wish especially to refer to our general policy—or want of it—in the past, and to advocate the great importance of instituting a proper policy, on possibly somewhat new lines, to remedy the present unsatisfactory state of affairs.

Before dealing with any of my three heads, let me remind you what are the conditions of to-day. We find the price of foreign timber continually increasing, recently at an abnormal rate, while the quality as steadily falls off. All consumers agree that the first quality to-day was the third quality twenty years ago; yet the advance in price in twenty

years has been 25, 50 and in some cases 100 per cent. The price of English timber of equal quality, on the other hand, has actually decreased during the same period.

Turning to the production of timber on estates, the lines on which we are proceeding can scarcely be considered satisfactory, or likely to lead to forestry being the sound investment which I believe it to be if conducted on proper economic lines.

Take the case of oak. We have, in our English oak, the finest known timber of its kind, and yet forestry tables prove that it is impossible to secure a return by the production of English oak. These tables are based, of course, on the price—the absurd price—that English oak realises on estates to-day, and which price is influenced not by its intrinsic value, but by a number of other conflicting and depressing causes.

The more we consider the subject of English timber, and especially its markets, or, rather, the absence of them, and the poor price obtainable, compared with the good demand

* Extracts from a Paper by M. C. Duchesne (Fellow), read at the Ordinary General Meeting of the Surveyors' Institution, held on Monday, December 16.

for the foreign, the more we must admit that there is something wrong, and that something should be done to remedy matters.

We have on all hands an immense consumption of wood in every form with large markets at our doors. Let us only cultivate them properly. I submit that it is principally a matter of organisation, coupled with what I may call wide as opposed to local knowledge of supplies and markets. This naturally means that the work of organisation must be on a large scale, and that it is practically impossible for private individuals independently to grapple successfully with the problem. We can succeed only by having an influential body to carry out the work of organisation. In place of spasmodic, disorganised and disjointed attempts on a small scale, we must adopt a complete and broad policy, copy the foreigner, and make woodland industries an important, up-to-date and extensive industry. No matter whether one discusses hoops for barrels with the cooper or English timber with the architect or other consumer, the principal reason they give for buying the foreign article is seldom its cheapness. It is almost invariably the difficulty of obtaining supplies of the native article in the quantity, quality, and at the moment required.

But I fail to see why we allow the foreigner to beat us in one of our own markets in the very centre of England. The principal reason given by consumers is that the foreigner by organisation meets every requirement of his customer, whereas we have no organisation, and require the customer to run after us and hunt up available supplies, because in the past there has been no central body for him to apply to for help.

On the other hand, I may find a local market glutted with English produce, and ruinous competition driving makers to give up an industry. This shows the danger of attempting these matters on a small scale. The only chance of success in all these cases lies in working on a large scale, and with wide in place of local knowledge of markets and supplies.

We shall undoubtedly see in the near future large schemes for the afforestation of what is termed waste land, and State forestry will refer almost entirely to high forest. But with the altered set of conditions in many districts—although I do not anticipate that the scare of the larger landowner will continue indefinitely—I am not at all sure that in estate forestry our hope of salvation may partly lie rather in the direction of coppice than high forest. This opinion is, of course, subject to the great and important change that would follow a proper co-operation and organisation of production and markets on the wide lines which I advocate.

To sum up. The principal reason for the decay of woodland industries and for the absence of proper markets for our timber is the narrow policy in the past of cultivating only a local demand for only local industries by local merchants with only local knowledge; while in the sale of the produce the landowner secured only local competition.

ENGLISH TIMBER.

In my opinion, unless steps are taken on the lines which I shall suggest, it is inevitable that these markets will go from bad to worse. English timber—as is shown by the daily decreased demand—is continually being ousted by the foreign timber in almost every market. I know of existing markets for English timber which will be lost in the near future. Some of these have been looked upon in the past as the backbone of the local trade. In very few of these instances is this loss due to the inferiority of English timber to foreign, but either to the natural change of market conditions or more often, as in the case of underwood, to unorganised marketing. There are new and good markets in plenty to take the place of existing ones as the latter die out, but all these are captured at once by foreign timber, owing to its superior organisation.

English timber suffered greatly through the period of agricultural depression, and the consequent drop in agricultural rents, which absolutely compelled landowners to fell large quantities of their timber. This led to all proper rotations of selling timber being upset, and a general unfortunate policy from which we have never recovered.

Meanwhile, supplies of high-class foreign timber were sent to this country, with the result that the demand for foreign timber increased, and many of the best and most up-to-date merchants discontinued marketing English timber and took up foreign.

Again, the out-of-date methods of many English timber merchants have compared most unfavourably with the foreign trade, both as regards converting and marketing the timber, and especially studying the consumer's requirements. The

principal handicaps of the English timber merchant are lack of capital and enterprise, and his undertakings being on too small a scale. Now that he has to compete in complicated markets with the highly skilled foreigner, the methods necessary are very different from the days when he purchased and converted timber for the simple requirements of local builders and wheelwrights.

The processes by which English timber markets were captured by the foreigner were gradually developed over a number of years. The latter's whole policy has been to market timber by the best and most economical methods; to organise the supply to meet the demand; to advertise the advantages of the produce offered for sale; to find fresh uses for it; to cultivate new markets; and especially, to consult the requirements, convenience, and wishes of customers. In the result architects now almost entirely omit English timber from their specifications, even when they might be anxious to specify it.

One may ascribe this partly to the ease with which any particular variety and quality of foreign timber is obtainable, partly to the many incorrect impressions about English timber that have obtained a firm foothold. Should an architect wish to specify English oak, he is usually informed by the contractor that there is none to be obtained. Again, many absurd and incorrect beliefs are held by architects regarding the sizes, and especially the quality, of English timber. This is mainly the result of unfair comparisons between English and foreign timber made by those who are interested in the latter. What should have been everyone's business has been no one's business, and hitherto nobody has taken steps to ensure fair treatment for English timber.

It is curious that many of the people who should have looked after the interests of English timber appear to have taken delight in going about crying stinking fish. Instead of defending English timber and pointing out its good qualities, they dwell solely on its suggested defects, and gave additional publicity to inaccurate statements, thereby playing into the hands of the foreigner.

English timber has also been hit by unmethodical marketing, which failed to ensure a regular supply.

(To be concluded.)

It has been decided to commence at once with the erection of an addition to the Provincial Police Orphanage, Redhill, Surrey. The new building will provide dormitories for forty-eight girls, with extensive bath and lavatory accommodation on each floor, eleven rooms for staff, new boiler house, stores, &c. The cost of the works is £4,000, and the architect Mr. J. Augustus Souttar, of 52 Bishopsgate, E.C.

A NEW head Post Office has been erected at Bishop's Stortford, and was opened for the use of the public on the 9th inst. The buildings comprise, amongst other accommodation, public office, sorting offices, telegraph and telephone instrument rooms and battery house, postmaster's offices, postmen's, linesmen's and telegraph boys' rooms, rest-rooms for the clerical staff, lavatories, cycle house, truck shed, engineers' stores-house, and numerous other stores-rooms, &c. Provision has been made for future extension and enlargement. The buildings have been erected by Messrs. J. Day & Son, of Bishop's Stortford, from the designs and under the superintendence of Mr. W. H. Atkin-Berry, F.R.I.B.A., of the firm of Messrs. Kidner & Berry, London.

THE Barnsley Town Council on Tuesday adopted a recommendation by a committee appointed to consider the question of a new town hall that the new building should be erected on the site of the present Manor House estate and the Central Chambers estate in Church Street, at an approximate cost of £15,000.

THE Sunderland Town Council decided that the plans passed on February 17 for adapting the Bede school buildings and the Cowan Terrace School for secondary education purposes should be rescinded, and that a larger scheme, under which a girls' secondary school would be provided on the present Bede site, and a boys' secondary school be erected on a new site should be adopted.

THE Plans and Works Committee of Edinburgh Town Council received a deputation on the 12th inst. from the Edinburgh building trades and electrical contractors with reference to the fair wages clause in Corporation contracts. The deputationists offered objections to the antecedent part of the clause and generally to its inquisitorial character. The matter was referred to a sub-committee in order, it is understood, to ascertain the operatives' point of view.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

BEDFORDSHIRE.

Luton.—Council schools, Leagrave Road. Messrs. J. R. Brown & Son, architects.

BUCKINGHAMSHIRE.

Amersham.—House, Amersham Hill Avenue. Mr. W. Gomm, builder.

Penn.—House, Penbury Grove, for Mr. H. Crane.

CAMBRIDGESHIRE.

Cambridge.—Primitive Methodist Church, Castle Street (£5,000). Messrs. A. F. Scott & Son (of London and Norwich), architects.

CHESHIRE.

Macclesfield.—Picture house, Buxton Road.

Parish Church, Hurdsfield: restoration (£850).

Runcorn.—Cinematograph Hall, High Street (for 800 sittings), for Mr. Thomas Aulton (of Southport).

Public Hall, next Bank Chambers, for Mr. Alphonso Smith (of Salford).

Tarporley.—The National and Utkinton Schools: alterations.

CORNWALL.

Budock Royal.—County secondary school for boys.

CUMBERLAND.

Whitehaven.—Coach works, New Road: additions and alterations. Mr. J. S. Stout, architect.

DERBYSHIRE.

Chesterfield.—Church, Stonegravel: extension.

Heanor.—Elementary school for 936 places (£10,250).

DEVON.

Barnstaple.—Battalion headquarters for the County Territorial Force Association.

Budleigh Salterton.—Detachment Drill Hall, &c., for the 4th Battalion as above.

Devonport.—Guildhall and Municipal Offices (£70,000).

Holsworthy.—Drill Hall, &c., for D Company, 6th Battalion of Territorial Force Association.

South Molton.—Artisans' dwellings.

Torquay.—Memorial Hall, Park Street (£2,000).

Torrington.—Drill Hall, &c., 6th Battalion and Squadron Headquarters, Royal N. Devon Hussars.

Umbleigh.—Council school (£2,150).

DORSET.

Motcombe.—Stalbridge Memorial Hall.

ESSEX.

Maldon.—Sixteen houses for the working class (£3,000).

Ongar.—Workhouse: alterations.

Wansted.—Fire Station (£1,250).

HERTFORDSHIRE.

Bishop's Stortford.—Hospital: Lady Gold Memorial wards.

LANCASHIRE.

Audenshaw.—Leather works: re-building. Messrs. J. H. & J. A. Percival (of Ashton-under-Lyne), architects.

Liverpool.—St. Barnabas Church: completion (£11,300). Roman Catholic Church, West Derby (£6,000).

LEICESTERSHIRE.

Hinckley.—Isolation Hospital (£6,000).

Leicester.—Wyggeston Schools: extension.

LINCOLNSHIRE.

Scunthorpe.—Masonic Hall, Crosby. Mr. A. M. Cobban, architect.

MIDDLESEX.

Hendon.—Court House (£3,400).

MONMOUTHSHIRE.

Bedwas.—Villa, Bryngwyn Street. Mr. G. L. Rees, architect.

NORFOLK.

Hindolvestone.—Church.

NORTHAMPTONSHIRE.

Peterborough.—Petty Sessions Court House (£1,500). Messrs. Townsend (A.R.I.B.A.) & Fordham, architects.

Two houses, Alexandra Road, for Mr. Marlow.

Shop, Midgate, for Mr. T. L. Barrett.

Weston Favell.—Convalescent Home: additions and alterations. Mr. W. Shaw (of Northampton), architect.

NOTTINGHAMSHIRE.

Norwell.—"The Beacon": additions and alterations. Mr. George Wells (of above), architect.

OXFORDSHIRE.

Banbury.—Forty houses, off Paradise Road (£6,500). Messrs. G. Lucas (F.R.I.B.A.) & Lodge (of London), architects.

SHROPSHIRE.

Clee Hill.—Public Elementary School, Cainham (for 200 places).

SOMERSET.

Bridgwater.—Picture theatre and shops, High Street (£11,000). Mr. B. Crewe (of London), architect.

Taunton.—St. Mary's Church: Askwith Memorial Vestry, &c. (£750). Messrs. Naylor & Sale, F.R.I.B.A. (of Derby), and Messrs. Sprankling & Price, joint-architects. Messrs. Spiller & Browne, contractors.

STAFFORDSHIRE.

Leek.—Twenty-four houses, Spring Gardens. Messrs. Bayley & Morris, builders.

Lichfield.—Wesleyan Sunday School, Tamworth Street.

Tamworth.—Workhouse: alterations (£1,600).

Walsall.—Post Office, Hatherton Place.

SURREY.

Compton.—Parish Church repairs (£550). Mr. Weir (architect to the S.P.A.B.), architect.

Hook.—Church Schools: enlargement and improvement (£800).

SUSSEX.

Battle.—Drill Hall for the County Territorial Force Association.

Brighton.—Workhouse alterations (£3,000).

Hayward's Heath.—Congregational Church, South Road. Wesleyan Church: enlargement, &c.; rebuilding schoolroom.

Horsham.—Two schools, New Street.

WILTSHIRE.

Melksham.—Picture theatre (£2,000). Messrs. Bennett & Stratton, A.R.I.B.A. (of Finchley), architects.

WORCESTERSHIRE.

Bromsgrove.—Workhouse: Children's Home.

YORKSHIRE.

Bridlington.—No. 3 Kirkgate: additions and alterations. Mr. F. Walkington, architect.

Castleford.—Three houses, Savile Road. (Apply, Mr. E. Craven, 46 Rhodes Street.)

Dewsbury.—House, &c., Thornhill Lees, for the Working Men's Club. Messrs. J. Barton & Son (architects).

Gawber.—House. Messrs. R. & W. Dixon (of Barnsley), architects.

Harrogate.—St. Mary's Church.

Leeds.—Clothing factory, Grace and Princess Streets. Mr. G. F. Bowman, architect.

Oulton-with-Woodlesford.—Council School: enlargement by 150 places.

Rotherham.—"Empire" Theatre, High Street (1,600 sittings) £20,000.

Scarborough.—Municipal School: additions and alterations (£1,550).

WALES.

Llanelly.—Electric Theatre, New Dock Road. Mr. O. P. Bevan, P.A.S.I. (of Merthyr Tydfil), architect.

Pembroke.—Drill Hall and Headquarters for the County Territorial Force Association. Mr. H. J. P. Thomas (of Haverfordwest), architect.

Swansea.—Central stores for the Corporation, Pottery Wharf (£15,000). Mr. G. Bell, A.M.I.C.E., Borough surveyor.

SCOTLAND.

Anstruther.—Golf cleeck factory, Shore Road, for Mr. D. W. Brodie.

Ayr.—Mercat Cross: re-erection (£600). Mr. J. K. Hunter, F.R.I.B.A., architect.

Buckie.—Church Hall, Portessie.

Cathcart.—Electric Theatre, Castle Street, for the Cathcart Picture Playhouse Co., Ltd.

Glasgow.—Ten self-contained houses, off Kelvindale Road. Mr. W. Waddell, builder.

Two double houses, Springburn Road, for Mr. W. Nimmo.

Special school for defective children, Garrioch Road, for the School Board.

Electric Theatre, corner of Vinicombe and Cranworth Streets, Hillhead, for the Hillhead Picture House, Ltd.

Kirkcconnel.—Board School enlargement (£3,550).

IRELAND.

- Curragh*.—Curragh House. Messrs. Orpen & Dickinson (of Dublin), architects.
Dublin.—Picture house, St. Mary Street. Mr. G. L. O'Connor, M.R.I.A.I., architect.
Longford.—"Castleforbes": additions. Mr. W. Coote, contractor.
 (Supplementary to last issue.) St. Mel's College: additions. Mr. T. F. Macnamara (of Dublin), architect. Mr. P. Kelly, contractor (£4,000).
Pembroke.—Working-class lodging-houses, Beatty's Field (£8,600) and Duignan (£12,000).

PATENT SPECIFICATIONS PUBLISHED DECEMBER 12, 1912.

Selected by James D. Roots, M.I. Mech. E., Thanet House Temple Bar, London.

- No. 10,260. Nov. 27, 1911.—J. Zwicky, 66 Chester Road, South Tottenham. Fire-extinguishing and like apparatus.
 18,503. Aug. 16, 1911.—Ludwig Grote, 177 Mount Pleasant Road, Tottenham, and A. H. Vivian, 103 Hop Exchange, London, S.E. Material or composition or mouldable substance, and process of manufacturing same.
 25,550. Nov. 16, 1911.—F. W. Campbell, 1 Laureldene, Cliftonville Road, Belfast, and J. M. Leighton, 4 Easton Crescent, Belfast. Formation of concrete piles.

EFFECTS OF TOWN AIR ON METALS.*

(Concluded from last week.)

DAVIS calculated that "coal smoke alone produces annually in the British Isles about 3,000,000 tons of sulphuric acid, most of which is showered down in the rain," and Dr. Carpenter estimated that at Widnes the same source gave 120 tons of sulphuric acid per day, to be condensed on metallic and other surfaces. Angus Smith found that the sulphuric acid in town rain was from six to twenty-six times that in the country, the average in English towns being about thirteen. The *Lancet's* analyses of London and Kent snow in 1906 showed in the former (as grains per gallon) 1.73 of sulphuric acid and 5.6 of solid matters containing tar; in the latter the figures were nil and 1.68 respectively. The Manchester Air Analysis Committee at an earlier date published a large number of determinations of the oxidised sulphur in the air of their city. Some of my own results with the atmosphere of towns as compared with the country have been recorded in the *Journal of the Sanitary Institute* and elsewhere.

I may recall an interesting observation of G. Witz in 1885 (*Comptes Rendus*, c. 1385), from which he inferred the existence of sulphurous acid "as a normal constituent of the air of towns." He remarked that placards covered with red lead, posted in situations where they are protected from the sun and rain, become gradually decolourised, whereas similar placards exposed under similar conditions in country air retain their colour unimpaired. The decolourised placards were found to contain lead sulphate and lead sulphite. He was also frequently able to recognise sulphurous acid in hail, snow, and especially hoar-frosts in the neighbourhood of towns.

But although the sulphur impurity of town air is commonly spoken of as sulphurous acid, the statement is not generally correct. As diffused in contact with excess of oxygen and moisture, aided by traces of nitrous compounds, and by ozone, which by this and other processes is eliminated from town air, SO_2 is almost at once oxidised into the more energetic sulphuric acid, and by this oxidation the destructive activity on metals is increased.

Some other ingredients of soot that would seem at first sight to be inert—namely, carbon and oxide of iron—have been proved to be agents in corrosion, on account of the fact that the action is probably for the most part electrolytic. Sir Gerald Muntz at the Institute of Metals in 1910 attributed a great part of the corrosion of brass in sea-water to "the juxtaposition of carbon." Tilden found that ferric oxide in contact with iron formed a couple in which the oxide was electro-negative, therefore the oxygen would be driven towards the metal, accounting for the gradual invasion of "pitting" under the spots of rust. Moreover, oxide, like all porous substances, absorbs air, and in that way tends to localise the effect. Bruhl's researches for the same Institute in 1911 also led to a conclusion that the local effect known as "pitting" was caused by electro-chemical action set up by certain substances, "and of these ferric hydrate and carbon are probably the worst."

Even when we protect bright surfaces in towns by gilding we find that its brightness does not last, and gold articles often become dull. The pure metal gold is little affected by atmospheric influences, but on account of its softness it is alloyed with copper and sometimes other metals to such an extent that some of these mixtures are nominated as "9 carat," or only 37 per cent, gold. The alloys will be, of course, affected proportionately by atmospheric tarnishing, and their frequent cleaning will occasion an appreciable loss of gold. Modern electro-chemistry has succeeded in plating with alloys. Much gold leaf is hammered from an alloy, and it has been remarked that the gilt titles of books in town libraries have a tendency to become faded, which does not occur in the country. It is evident that with all bright metals the constant cleaning necessitated by the attack of town gases and the sooty film occasions a loss of the body of the substance, without speaking of the immense aggregate labour involved. Brass and bronze are not dissolved uniformly, the more positive metal zinc being oxidised first, so that in extreme cases the copper is left in a spongy state, the alloy becomes brittle and is rapidly worn away.

Atmospheric corrosion effects constant damage, resulting sometimes in serious accidents, by causing loosening or detachment of metallic fastenings. The perishing of wires and

* A Paper by Dr. S. Rideal, D.Sc., F.I.C., prepared for presentation to the International Smoke Abatement Conference at the Agricultural Hall, London, N.

electric fittings has given rise to interrupted connections or even to fires from short circuits.

The corrosion of iron is deeper and more rapid. In a pure atmosphere, containing, besides the inert nitrogen, only oxygen, carbon dioxide, and water vapour, iron can remain nearly or quite rustless. The ordinary commercial metal has less immunity, since it contains, among other impurities, sulphide, phosphide, carbide, and free carbon; still the action under these conditions is slow. But if saline substances and strong acids are introduced with the water, the rusting becomes active, and with the aid of electrolysis the corrosion quickly extends. It may be noticed that with nearly all metals, whether the vapours or solutions are acid, alkaline, or neutral, if salts are present the latter become dissociated by great dilution, and the ammonia can act, for instance, on copper, and the sulphuric acid on iron.

I was called in consultation in 1905 on the accident at the Charing Cross Station, when the roof girders collapsed through rusting, and analysed many samples of the rust. One sample from a lateral girder contained 4.25 per cent. sulphuric acid (as SO_3), equal to 8.95 per cent. of iron dissolved as ferrous sulphate. The rusting is obviously more rapid in closed spaces where the acids from coal consumption are restricted in range, and especially on a roof where condensation will occur. At the same time similar results of analysis were obtained from other London stations, while in the open country and at an erection in a small town (Dorchester Cattle Market) exposed iron had much less rust, with about one-fourth to one-third the amount of sulphate. It was found in this case that the accident was owing to the structure not having been properly protected by painting. When hot oil is put on the clean metal immediately after rolling, it forms a permanent coating; similarly in repainting old work it is essential that it should be properly cleaned with wire brushes and free from rust, and a coating of oil applied hot, which will then adhere.

Other constituents of town soot deposits are chlorides and lime compounds. The above-mentioned report on the soot-fall of London remarks that "the presence of chlorides in the rainfall of London is a mystery, as both coal and gas are free from chlorides." But the distinct traces of chloride in various coals have escaped notice as not being ordinarily of commercial importance. Wills found in one variety from Staffordshire 0.06 per cent. of chlorine. There were also several other sources of chlorides in the atmosphere of towns, such as the burning of refuse, and an appreciable amount is given off by living beings. It has been proved that marine spray is often carried by wind for long distances inland, and this in towns is absorbed and concentrated by the soot. Sulphuric acid from coal burning would liberate hydrochloric acid from chlorides, and the latter acid has a quicker solvent action on many metals than sulphuric. As to lime compounds derived from the ash of coal and from the dust of building operations, they simply, as a rule, add mechanically to the incrustation on metallic surfaces, and may rather hinder corrosion.

A few words must be said on the action of some of these impurities on metallic pigments. Unfortunately, many artists, notably Turner, have made free use in their pictures of lead preparations, which are seriously affected by sulphuretted hydrogen and sulphurous acid, the one by blackening, the other by bleaching. The best varnishing, and even glass, does not protect entirely from town air. Darkening of ordinary white paint, containing as it does lead hydrocarbonate, is familiar, and necessitates continual great cost in repainting.

As to remedies for the action of town air on metals, protection of the surface has always been practised, and varnishing, lacquering, and painting are effectual for the time. The principle of guarding by a more electro-positive metal, as in the so-called galvanising with a coat of zinc, is one of the resources; in this case, atmospheric action causes a solution of the zinc, or a crust of oxide, carbonate, or basic sulphate, while the structural iron is protected. On the other hand, in common tinning, although tin itself is almost proof against air gases, the iron underneath, if in any way the coating be broken, is more rapidly corroded. Plating with nickel is well known. Aluminium is especially affected by alkalies; a recent patent (22,684 of 1910) protects it by a film of copper, supplemented by a special lacquer. I found that the coating retards the attack on the metal and prolongs its life for many industrial purposes.

Some of the more or less successful protective methods depend on forming hard uniform and coherent coatings analogous to those which are produced irregularly and loosely by atmospheric influences. Examples are the Bower-Barff process, in which a film of magnetic oxide is formed on iron

by heating in steam; the "bronzing" or "browning" of gun-barrels, and the sulphurising or so-called "oxidising" of silver.

In America a very pure form of iron, called "ingot iron," has been recently made, and is said to be almost rust-proof, and to have a power of resisting acids which is twenty times that of ordinary steel.

A common drawback of coatings of metals less subject to attack, and of varnishes and lacquers, is that they either crack or scale off easily or have pin-holes or scratches; such defects in many cases increase the rate of corrosion, making it irregular and local, and actually more dangerous because unseen. Enamelled iron is good when stationary, and it is common observation how serviceable it has proved for street signs.

I dealt with this subject at the Conference on Smoke Abatement in 1905, and gave statistics of the time in the paper "Acids of Smoke," published in the Journal of the Royal Sanitary Institute. Since then there has been much improvement in the conditions, owing to the work of smoke abatement societies, and to the introduction of smokeless lighting by incandescent burners and by electricity, and of heating by gas stoves instead of coal fires. We must remember in the present purification of gas 90 per cent. of the sulphur in the coal is removed, and the methods of burning eliminate the evils of smoke and soot, which we have shown to have pre-eminently the most injurious effect on metals.

VARIETIES.

MESSRS. W. V. & A. R. GOUGH, architects, Bristol, have prepared the plans for completing the church of St. Aldhelm, Bedminster, at a cost of £3,000.

THE Keighley plumbers' strike is at an end, the men having accepted the masters' offer of $\frac{1}{2}d.$ advance now to $8d.$ per hour and $\frac{1}{2}d.$ a year hence.

THE Port of London Authority have accepted the tender of Messrs. Perry & Co., amounting to £105,466, for the construction of a deep-water riverside jetty at Tilbury.

MR. E. B. L'ANSON, M.A., F.R.I.B.A., who died recently at the age of sixty-nine, left estate of the gross value of £87,194, of which the net personalty has been sworn at £70,746.

FURTHER wages advances for carpenters and joiners are officially announced as follows: Arbroath, Glossop, and Worksop—one halfpenny per hour with better working rules; Sunderland, one farthing per hour.

THE committee of the proposed South London Hospital for Women have received an offer from some sympathisers of a site at Clapham Common and a donation of £25,000 for the erection of the necessary buildings.

THIS year has been a record building year in the city and suburbs of Sydney, New South Wales. The expenditures, with the cost of the Harbour Trust buildings, amounting to £175,000, made an aggregate of £6,299,000, or over £750,000 more than in 1911.

THE Newcastle Education Committee have given authority to the sub-committee to recommend the appointment of an architect or architects to submit for consideration designs for a complete scheme of extensions to Rutherford Technical College. The cost of the first stage of the extensions is estimated at £10,000.

THE Carpenters' Company has again issued particulars of a course of lectures to be delivered in their hall on the arts connected with building. The names of the lecturers are a sufficient guarantee for their excellence, and the whole series is an interesting one to artists and craftsmen connected with buildings. The first lecture will be given on January 8 next at 7.45 p.m. by Sir Alfred East, R.A., the subject being "The Value of Colour to the Crafts."

TRADE NOTES.

UNDER the direction of Mr. J. A. Marsden, architect and surveyor, Doncaster, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Picture Palace, Doncaster.

OWING to the continued expansion of their business, Messrs. W. F. Stanley & Co., Ltd., have been compelled to provide much larger office accommodation, and they will in future occupy the whole of the upper part of the premises at 286 High Holborn, W.C., where their showrooms have been on the ground floor for some time, retaining their old premises at 4 and 5 Great Turnstile, Holborn, W.C., for export only.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BELFAST.—Jan. 1.—The Corporation invite designs in competition for 126 houses of two apartments each and 126 houses of three apartments each. Premiums of £25, £15, and £10 are offered for those designs placed respectively first, second and third for each of the two sizes of dwellings. Mr. H. Seaver, B.E., architect, Belfast, and the City Surveyor will act as assessors. Printed conditions and block plans of the sites will be supplied on payment of £1 1s. deposit by Mr. H. A. Cutler, M.Inst.C.E., city surveyor, Town Hall, Belfast.

DUBLIN.—The Estates and Finance Committee of the Dublin Corporation invite competitive designs for proposed municipal offices. Copies of conditions and instructions, together with other particulars, may be had on payment of £2 2s. deposit to Mr. E. W. Eyre, City Treasurer, Municipal Buildings, Dublin.

HARROGATE.—Feb. 3.—The Education Committee invite designs for an elementary Council School which they propose to erect in the Skipton Road, to provide accommodation for 675 children. A copy of the conditions of competition may be obtained from Mr. C. E. Rivers, A.M.I.C.E., borough engineer, Municipal Offices, Harrogate.

HAYTI.—Feb. 4.—The Acting Consul-General at Port-au-Prince reports the announcement in the *Moniteur* of a competition of designs for a national palace at Port-au-Prince. Plans will be received by the "Département des Travaux Publiques," Port-au-Prince, up to Feb. 4, and prizes of \$500 (about £103), \$250, and \$200 will be awarded. The building and furnishing of the new palace, is expected to cost about £80,000. The *Moniteur*, containing further particulars, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

HEMEL HEMPSTED.—Jan. 31.—The Town Council invite competitive designs for a housing scheme, comprising twenty-five houses. Premium offered £20. Deposit £1 1s. The Borough Surveyor, Town Hall, Hemel Hempstead.

AGENTS IN CAPE TOWN:—Messrs. D. M. MURRAY & CO., 2, 4, 6, & 8 Greenmarket Square. Importing Agents. Stocks kept.

JAMAICA.—Jan. 31.—The Mayor and Council of Kingston offer a prize of £100 for a design for municipal buildings (suitable for construction in reinforced concrete) to cost not more than £9,000. Charge 2s. For information apply to Messrs. Alexander Young (London), Ltd., 60 Fenchurch Street, London, E.C.

LANCING.—Sketch plans are invited for church accommodating 500 people, to be erected in South Lancing, to cost, when completed, from £4,000 to £5,000. Communications to be sent to the Secretary of Building Committee, Rev. E. Peel, Lancing Vicarage, Worthing.

SWAFFHAM.—Jan. 25.—The Rural District Council are about to submit schemes to the Local Government Board for erection of workmen's cottages, and invite plans, specifications, and estimates (on the cubic principle) for suitable cottages (in pairs only), each cottage to contain not less than three bedrooms, with suitable living rooms and offices. The person whose design is selected and approved will be paid £10 premium. Mr. S. Matthews, clerk, Swaffham, Norfolk.

WELLINGTON (SALOP).—The Urban District Council invite competitive designs for houses to be let at 3s. to 3s. 6d. a week. A prize of £10 10s. will be given for the design most approved by the Council, and the plans for which such prize is awarded shall become their absolute property. No undertaking is given or to be implied that the architect submitting such plans will be employed to carry out the work, or that the scheme or design will be carried out. Mr. J. W. Littlewood, Clerk, Bank Chambers, Wellington, Salop.

CONTRACTS OPEN.

BECKENHAM.—Jan. 13.—For the following, for the Urban District Council—viz.: (1) Supply and erection at Kelsey Park, Beckenham, of two rustic thatched shelters, about 32 feet by 16 feet each; (2) supply of some 180 rods of rustic fencing, 3 feet high; and (3) the erection of a greenhouse, 20 feet by 10 feet. Deposit £1. Mr. J. A. Angell, surveyor, Beckenham.

BLACKHILL.—For erection and completion of the various works required in proposed premises, Derwent Street, Blackhill, Durham, for Messrs. Walter Willson, Ltd. Mr. D. M. Spence, architect and surveyor, 24 and 25 Central Exchange Buildings, Newcastle-on-Tyne.

BOOTLE.—Jan. 3.—For alterations and additions to the Territorial quarters of the 7th Battalion the King's (Liverpool Regiment), in Park Street, for the West Lancashire Territorial Force Association. Deposit £1 1s. Mr. H. L. Beckwith, architect, Bank Chambers, 3 Cook Street, Liverpool.

BRADFORD.—Dec. 28.—For the work required in erection of a weaving shed at Norwood Green, near Wyke, Bradford. Drawings may be seen and bills of quantities obtained at the offices of Messrs. Moore & Crabtree, architects, York Chambers, Keighley, on Dec. 28.

BROCKENHURST.—Dec. 30.—For the reconstruction of the superstructure of Brockenhurst Bridge, consisting of two 20 ft. spans of steel decking, for the Hampshire County Council. Deposit £2 2s. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BUNTINGFORD.—Jan. 8.—For the construction of a precipitation tank at the sewage disposal works. Mr. E. G. Thody, surveyor, Rural District Board Room, Buntingford.

CARLISLE.—Jan. 13.—For the whole of the work required in providing additional storage at Earl Street, for the County Property Committee. Mr. G. Dale Oliver, F.R.I.B.A., County architect, Carlisle.

CHATHAM.—Jan. 4.—For erection of an elementary school at Ordnance Street, for the Education Committee. Send applications and £2 2s. deposit by Jan. 4 to Mr. G. F. Bond, architect, High Street, Rochester.

CHORLTON-CUM-HARDY.—Jan. 8.—For reinforced concrete work at the Carnegie library, Chorlton-cum-Hardy, near Manchester, as follows: Dome, 28 feet, octagon; roof, flat, 400 super yards; floor, 145 super yards, for the Libraries Committee. Deposit £1 1s. The City Architect, Town Hall, Manchester.

CLEETHORPES (LINCS).—Jan. 16.—For additions to the Bancroft Street Council school at Cleethorpes, for the Lindsey County Council Education Committee. Send applications and £1 1s. deposit by Jan. 1. Messrs. Scorer & Gamble, architects, Bank Street Chambers, Lincoln.

COTTERED.—Jan. 8.—For the repair of the public draw well upon the green at Cottered, near Buntingford, for the Cottered Parish Council. Mr. E. G. Thody, surveyor, Buntingford.

COTTINGHAM.—Jan. 1.—For alterations and additions to the Council School, for the East Riding of Yorkshire County Council. Deposit £1 1s. Apply at the School and the Building Surveyor, County Hall, Beverley.

DONCASTER.—Dec. 30.—For the erection and completion of a Nurses' Aid and Rescue Station at Wheatley, Doncaster. Send applications by Dec. 30 to Mr. James E. Knight, architect, 33 College Street, Rotherham.

DORCHESTER.—Jan. 2.—For alterations and repairs to the stables at Loud's mill. The Borough Surveyor, North Square, Dorchester, Dorset.

EAST HAM.—Jan. 21.—For erection of Brampton Road school to accommodate 1,491 scholars. Send application by Dec. 31 to Mr. R. L. Curtis, architect to the Education Committee, 11-12 Finsbury Square, London, E.C.

FORDINGBRIDGE.—Jan. 11.—For alterations and additions to the cells and police station at Fordingbridge, for the Hampshire County Council. Deposit £1 1s. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

FOWEY.—Jan. 6.—For erection of cottage hospital, Fowey. Deposit £2 2s. Mr. C. W. Parkes Lees, architect, Porthpean House, Lanteglos-by-Fowey.

HUNMANBY.—Jan. 1.—For erection of a teacher's house at the Council School, for the East Riding of Yorkshire County Council. Apply at the School and the Building Surveyor, County Hall, Beverley.

IRELAND.—Jan. 2.—For additions and alterations to St. Agnes' Hospital workhouse Cork. Mr. J. Cotter, clerk, Board Room, Cork.

IRELAND.—Jan. 13.—For erection of two houses at Markethill station, Armagh, for the Great Northern Railway Co. (Ireland). Deposit £1 1s. The Engineer's Offices, Dublin and Belfast.

IRELAND.—Jan. 15.—For the building of thirty labourers' and fourteen artisans' cottages at Workhouse Road, Ballina, for the Urban Council, together with boundary walls, sewers, roads, &c. Charge 5s. Mr. J. S. Cairns, C.E., architect, Ballina.

IWADE.—Jan. 11.—For the erection of a Council school of special construction in steel and concrete to accommodate 120 scholars at Iwade, for the Kent Education Committee. Send applications and £1 deposit by Jan. 1 to Mr. F. W. Crook, secretary, Caxton House, Westminster, S.W.

KIPPAX.—Jan. 10.—The West Riding Education Committee invite whole or separate tenders for the following works: Kippax Council school additions (builder, joiner, slater, plasterer, plumber, and painter). The Education Architect, County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

LONDON.—Jan. 2.—For erection of additional bedrooms for officers over the east wing of the front central block at their infirmary, Dartmouth Park Hill, N., for the St. Pancras Borough Council. Deposit £5. Mr. J. E. P. Hall, clerk, Town Hall, Pancras Road, N.W.

LONDON.—Jan. 2.—For taking down and rebuilding parapet and certain other works at Nos. 31 and 32 Tredegar Square, Mile End, E., for the Guardians of Mile End Old Town. Mr. E. J. Harrison, architect, 9 Gray's Inn Square, W.C. Send £1 deposit to the Clerk to the Guardians, and delivered at the Guardians' Offices, Bancroft Road, Mile End, E.

LONDON.—Jan. 7.—For fire-proofing the central octagon and wings at the National Gallery, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. H. A. Collins, H.M. Office of Works, Storey's Gate, London, S.W.

LONDON.—Jan. 9.—For certain sanitary works, &c., at the St. George's Workhouse, Mint Street, S.E., for the Guardians of the Southwark Union. Deposit £5. Mr. A. Saxon Snell, F.R.I.B.A., architect, 9 Bentinck Street, Manchester Square, W.

LONDON.—Jan. 21.—For the construction of buildings for public conveniences on the Victoria Embankment, near Blackfriars Bridge, for the London County Council. Deposit £1. Sir Maurice Fitzmaurice, C.M.G., chief engineer of the Council, County Hall, Spring Gardens, S.W.

LYMINGTON.—Jan. 11.—For alterations and additions to the cells and police station at Lymington, for the Hampshire County Council. Deposit £1 1s. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

NAFFERTON.—Jan. 1.—For the erection of a Council School for 136 children, for the East Riding of Yorkshire County Council. Deposit £1 1s. The Building Surveyor, County Hall, Beverley.

NANSPUSKER.—Jan. 1.—For building a pump house of masonry, 32 ft. by 27 ft., at Nanspusker, Cornwall, about three miles from Hayle station, for the Phillack Urban District Council. Mr. G. W. Harris, A.M.I.C.E., 1 Holyrood Place, The Hoe, Plymouth.

SCOTLAND.—Jan. 6.—For the works to be executed in the construction of new station buildings and relative works at Port Glasgow, for the Caledonian Railway Co. Deposit £2 2s. The Engineer, Buchanan Street Station, Glasgow.

SCOTLAND.—Jan. 7.—For the following works required in connection with proposed new dining hall, Coplawhill, Albert Road, for the Glasgow Corporation—viz.: (1) digger, mason, and brick works; (2) carpenter and joiner works; (3) slater works; (4) plumber work; (5) plaster work; (6) tile work; (7) painter work. Mr. J. Dalrymple, general manager, 46 Bath Street, Glasgow.

SOUTH KIRKBY.—Jan. 10.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with enlargement of South Kirkby Council School: Builder, joiner, slater, plumber, plasterer, painter. The Education Architect, County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

SOUTHMINSTER.—Jan. 4.—For erection of headquarters, stores, &c., for 4th Battalion the Essex Regiment, for the Territorial Force Association, County of Essex. Send applications and £2 2s. deposit before Jan. 4 to Colonel F. F. Johnson, C.B., secretary, Market Road, Chelmsford.

TAUNTON.—Jan. 18.—For erection of the showyard buildings, enclosures, &c., for their forthcoming show at Taunton in May 1913, and for four subsequent shows in Somerset, for the County Agricultural Association. Mr. H. O. Samson, Lic.R.I.B.A., surveyor to the Association, Hammet Street, Taunton.

TOTTON.—Jan. 11.—For making alterations and addition to the cells and police stations at Totton, for the Hampshire County Council. Deposit £1 1s. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

WALES.—Dec. 30.—For erection of offices at the Pontardawe Steel, Tinplate and Galvanising Works, for Messrs. W. Gilbertson & Co., Ltd., Pontardawe. Mr. J. C. Rees, M.S.A., Parade Chambers, Neath.

WALES.—Jan. 3.—For additions and alterations to the Imperial Hotel, Mount Stuart Square, Cardiff, for the Alliance Buildings, Cardiff, Ltd. Mr. Sidney Williams, Lic.R.I.B.A., architect, Wharton Street, Cardiff.

WALES.—Jan. 3.—For erection of an administrative block receiving home, boys' home, stable, &c., at Llwydcoed, for the Merthyr Tydfil Board of Guardians. Mr. T. Roderick, architect, Clifton Street, Aberdare.

WALES.—Jan. 9.—The Swansea Harbour Trustees invite tenders for the supply, delivery, and erection of: (1) One framed and braced steel double-storeyed extension of the grain shed at the Prince of Wales Dock, with sides and roof covered with galvanised corrugated sheeting; the extension to be 70 feet long by 63 feet wide. (2) Two framed and braced steel single-storeyed extensions of the transit shed at No. 1 Quay, King's Dock, with sides and roofs covered with galvanised corrugated sheeting; the extensions to be 122 feet long by 60 feet wide and 96 feet long by 60 feet wide respectively. Deposit £3 3s. Mr. Talfourd Strick, clerk, Harbour Offices, Swansea.

WALES.—Jan. 9.—For the erection of a drill hall and house for instructor at Maesteg, for the County of Glamorgan Territorial Force Association. Deposit £1 1s. Mr. H. A. Clarke, architect and surveyor, Briton Ferry.

WALES.—Jan. 11.—For erection of a Council School buildings at Hook, in the parish of Llangwm, for the Pembrokehire Education Authority. Deposit £1 1s. Mr. O. T. Thomas, Lic.R.I.B.A., County Education Offices, Haverfordwest.

WESTHOUGHTON.—Jan. 14.—For the erection of an elementary school to accommodate 281 scholars at Fourgates, Westhoughton, Lancs. Deposit £2. Mr. H. Littler, county architect, 16 Ribblesdale Place, Preston.

WHITEHAVEN.—Dec. 31.—For erection of two dwelling-houses, Low Road, for Mr. Hewitson Hurst. Messrs. J. S. Moffat & Bentley, architects, &c., 53 Church Street, Whitehaven.

WORSBOROUGH DALE.—Jan. 10.—The West Riding Education Committee invite whole or separate tenders for alterations, &c., to Worsborough Dale Council School (builder, joiner, slater, plumber, plasterer and painter). The Education Architect County Hall, Wakefield. Send £1 deposit to the West Riding Treasurer, County Hall, Wakefield.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Failsworth, Manchester, have received repeat order to supply their double-fronted patent Manchester stoves with descending smoke flues to the Napier Hospital, New Zealand.

MR. ROBERT JONES, who has been appointed chief manager of the Oakeley slate quarry, which is one of the principal quarries in North Wales, began work as an ordinary quarryman. The appointment is exceedingly popular with the workmen.

THE scarcity of houses in Clitheroe is being severely felt, and at last week's meeting of the Town Council the Town Planning Committee and the General Finance Committee were authorised to select a suitable site and prepare plans and estimates for the erection of about twenty houses suitable for working-men's families.

THE Council of the University of Leeds, in order to provide for an extension of the administrative offices, have decided to enlarge the buildings in College Road by a block of two storeys, situated between the main entrance to the University and the Department of Chemistry. The erection of the building has been entrusted to Mr. Paul Waterhouse, F.R.I.B.A. The materials to be used on the frontage are red brick and stone of the same kinds as those used in the adjoining later buildings. The contractor, selected in a limited competition, is Mr. Paul Rhodes, of Leeds. Building operations will commence immediately.

MR. HENRY FROWDE announces a new volume in the "Church Art Series," of which the general editor is Mr. Francis Bond. It deals with the subject of English Church bells, and the author is Mr. H. R. Walters, joint-editor of volumes on the Church bells of Essex and Warwickshire. Curious local uses and customs in ringing bells are dealt with very fully, and very numerous specimens are given of the dedications, inscriptions, and stamps on bells. The volume also contains the most complete account yet given of mediæval and post-Reformation founders and foundries. The great development of interest in campanology may be gauged from the fact that the bibliography of bell literature in Mr. Walters's book occupies no less than eleven closely-printed pages. The volume will be profusely illustrated, as its predecessors in the series, with photographs and drawings.

ENGLISH TIMBER: ITS MARKETS, VALUE AND PRODUCTION.*

(Concluded from last week.)

THE fluctuating and uncertain supply of English timber assisted the foreigner. It enabled him to provide just what was required at any time, and thereby secure our markets. He was competing against a local, disorganised, and small trade, and so could defeat the English timber merchant almost everywhere.

By organisation we should ensure constant and regular supplies. Not until these are forthcoming for a given purpose can we expect consumers to purchase supplies grown in this country. I would remind you of the unlimited home market for timber—totalling approximately £30,000,000 per annum—which fact illustrates the fallacy of an argument often advanced to the effect that English timber realises a poor price in a particular district on account of "the glut of English timber in the market." The actual fact is usually quite the reverse. The difficulty is more often to obtain sufficient supplies. It is only in very limited and usually very local markets that there is any competition between supplies of English timber.

Another fallacy is that the consumer always purchases foreign timber, because it is cheaper than English. Study the quotations in the various building and other journals where the current prices of imported timber are given, and you will realise the falsity of this statement.

There is one great advantage which we possess, viz. the great natural superiority of the varieties of our timber, especially our hardwoods. All authorities admit that there is scarcely a country in the world where timber of finer quality can be, and, in many instances, is grown. This may be due largely to our climatic conditions and geographical position, and to the superior timber produced by our indigenous trees. All authorities are agreed that for tensile strength, durability and other important qualities there is no oak in the world to compare with English oak. The same remark applies to other of our native timber, especially English ash. The unique qualities of our native timber for special purposes points to the advisability of advertising the fact to the consumer. I attribute the loss of several of our best markets to the fact that we do not advertise our goods sufficiently to induce the consumer to pay a higher price for an admittedly superior article.

TIMBER FOR BUILDING CONSTRUCTION.

I have already referred to the unfortunate fact that architects at present almost entirely omit English timber from their contracts. There are many varieties of English timber which might be more extensively used, but here, too, I must confine my remarks to the question of oak, using this timber as an illustration. There is no question that for oak panelling, oak beams, oak entrance gates and fencing, and oak block floors, there is no oak which can compare with our native wood, thanks to its fine qualities and rich appearance and figure.

One of the principal objections advanced against our native oak is that it is harder to work than the foreign. Speaking generally, that is quite true, but it is at once a proof of its superiority. Nearly all valuable woods are more difficult to work than inferior. The prejudice against English oak under this head is largely responsible for other objections advanced against its use, such as that it is more likely to open or split. But consider the lovely old work in English oak of which there are so many examples everywhere. I am certain that if we only will use as much care, knowledge, and skill in the conversion to-day as our forefathers did there would be little foundation for these contentions. There is no branch where less knowledge and skill is brought to bear than in the seasoning, and also the conversion of English oak for such purposes as interior work.

I have often argued the undoubted advantages that quartering oak has over our present slipshod methods of converting it, but I seldom meet an experienced man who has ever considered the question seriously. About the only reason given for oak not being properly quartered is that there is more waste in conversion. If this is to be advanced as an excuse, I would suggest that it is actually an excuse for incompetence; and an illustration of the disadvantage of conducting the timber trade on too small a scale.

When going through the Chicago packing factories, I was informed that there was nothing they did not make

use of in a pig but the squeal. If a business is conducted on a large scale, and the man knows his business, there is nothing which he cannot make use of in the oak tree, not even excepting the sawdust or the bark, as these are capable of being utilised to-day. Again, in this case, the quartering of oak depends largely on the diameter of the log; but, as the London contractor—so one informed me—has to pay more for inch boards of English oak than for Spanish mahogany, I am convinced there is a large and lucrative trade to be done with architects. This conviction has been confirmed by conferences which we have held with them during the past twelve months.

I have referred more than once to steps which we were taking with regard to special points, and illustrated the urgent need of an influential body to organise supplies and to protect the interests of the producers of English timber and coppice.

Now these proposals have taken practical shape, I hesitate to refer to a body for whose existence I am largely responsible, and in whose work I take a responsible share. Since, however, the existence of

THE ENGLISH FORESTRY ASSOCIATION

is so little known, while its influence upon the markets, value, and production of English timber may well be incalculable, I trust that in these circumstances you will pardon the reference.

It is impossible to explain in a few words the detailed policy of this Association, but its objects may be summarised briefly under two heads:—

1. To encourage the demand for English timber (and coppice), to advertise its superior qualities, to encourage its use by consumers, to organise the markets, and to assist the consumer to secure sufficient and regular supplies with the least possible trouble.

In pursuance of this first part of our policy the following are a few of the special steps we are taking (or have taken):—

(a) We are holding conferences with architects, railway and colliery managers, and representatives of other special markets.

(b) We propose to distribute in the proper quarters information dealing with the different varieties of English timber and pointing out its special qualities for any particular purpose, and its advantages as compared with other timber (e.g., English oak for railway goods wagons, &c., English v. Russian larch for fencing, &c., larch v. Baltic fir for barge building, &c.).

(c) We shall endeavour to give the fullest publicity to some of these points, so that the general public will insist on purchasing, and be willing to pay more for, the superior article (e.g., English oak for panelling, block flooring, entrance gates, &c.).

(d) We hope to act as a central bureau to which consumers can write on any point relating to English timber, and especially as to where supplies can be obtained. Architects wishing to specify English oak for panelling, or coopers desirous of purchasing English barrel-hoops, will then know where to apply for information.

(e) We hope to organise new, and to revive old, woodland industries, and to take all necessary steps to insure proper markets for our coppice and timber.

The above steps must have a beneficial effect on English timber; in fact, we can already point to good results. Moreover, we shall do everything to ensure a proper supply of the timber to meet the demand, and endeavour to bring about a proper organisation of the marketing.

2. To supply all information relating to English timber (and coppice), especially its marketing, and to assist members in every way possible in the sale by placing them in touch with the best buyers and taking steps to ensure them the best price obtainable.

This will ensure the markets for coppice and timber being wide rather than local in character, and the introduction of buyers from a distance will obviate the necessity of relying solely on local competition. Leaflets will be distributed to members, giving information as to the different varieties of timber and coppice, suggesting new markets with information thereon, and emphasising important points in the production when required for a special purpose.

It is most important for producers to know the requirements of, and to keep in close touch with, markets. It is impossible to calculate the loss (1) to individuals, (2) to the country, and (3) to forestry and rural development resulting from our failure to do this in the past. It is nothing

* Extracts from a Paper by M. C. Duchesne (Fellow), read at the Ordinary General Meeting of the Surveyors' Institution, held on Monday, December 16.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

15 CENTY COTTAGE WIMBOURNE

SKETCHED SEPT. 21 1912

Prize Drawing by CHARLES H. ROBERTS.

short of deplorable that valuable woodland industries have been lost for want of a little organisation.

I would remind you that only a body consisting of land-owners and land agents can have a proper knowledge of the supplies of English timber available and can organise the marketing of these supplies. To obtain really good results from conferences, such as I have referred to, one must have them arranged by an independent body with the necessary information at their disposal, and with an influential council.

To remove any misapprehensions I wish to emphasise that this is not a trading association, and we do not propose as a body to buy or sell any timber. We do not, there-

fore, compete with timber merchants. On the contrary, by creating a healthy demand for English timber and improving the present position we must do them a great deal of good. Especially as we leave it to the recognised channels to supply this demand.

We do not charge commission on the sale of timber or otherwise, so we do not conflict with agents or auctioneers. We prefer in all cases to leave the actual negotiations on the sales of timber to be carried out between agent and purchaser. It is quite impossible for agents, with their numerous and increasing duties, unaided to keep in the close touch with markets that is so necessary to-day.

We limit our ground to the marketing and the com-

mercial utilisation of timber, so that we do not interfere with the arboricultural or any other existing society, and we hope to work in cordial co-operation with all other bodies.

We do not suggest that we have a five-minute solution for all the problems relating to English timber, but we submit that this is an honest attempt to tackle the question and to improve the present unsatisfactory state of affairs, and as such it is deserving of support.

There are, of course, as in every problem, many obstacles to surmount, not the least of which is to counteract the depressing influence of those who take delight in exaggerating the difficulties, and, in fact, make a special point of advertising them broadcast. It is most important, before undertaking anything, to examine the obstacles fully, to see how they can be overcome; but a person who thinks solely of the difficulties of a problem will inevitably end as a member of that band of infallible immortals who never make a mistake for the good reason that they never attempt anything.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

BUCKINGHAMSHIRE.

Eton.—Roman Catholic Church. Messrs. Palmer & Sons, builders.

CHESHIRE.

Chester.—Working-class cottages (£7,000 to £8,000).

Congleton.—St. James's, St. Peter's, and St. Stephen's Council schools: alterations.

Macclesfield.—Technical and Science school: extensions, &c.

Nantwich.—Secondary school. County architect.

Tarporley.—British schools: alterations.

CORNWALL.

St. Day.—Sunday school, North Corner.

CUMBERLAND.

Calthwaite.—Church. Mr. J. H. Martindale, F.R.I.B.A. (of Carlisle), architect.

Carlisle.—Council school.

St. Bede's Council school: additions and alterations.

Borough surveyor.

Technical school.

DERBYSHIRE.

Derby.—County Children's Hospital: out-patients' department (£1,000).

Heanor.—Secondary school: additions (£1,000).

New Mills.—Secondary school for 252 places (£10,000).

Mr. G. H. Widdows, A.R.I.B.A. (of Derby), architect.

DEVON.

Barnstaple.—Battalion Headquarters for the County Territorial Force Association.

Devonport.—Church, Warleigh Road, Ford. Mr. C. Cheverton, architect.

Municipal buildings.

Ivybridge.—Detachment Drill Hall for the 5th Battalion County T.F.A.

Okehampton.—Headquarters for B Company, 6th Battalion County T.F.A.

Plymouth.—Headquarters for Devon R.E.

Plympton.—Headquarters for No. 2, Heavy Battery, Devon R.G.A.

Tiverton.—Drill Hall, &c., for E Company, 4th Battalion, County T.F.A.

Totnes.—Company headquarters, &c., for 5th Battalion and Royal 1st Devon Yeomanry.

DURHAM.

Hebburn.—Thirty-six houses, High Road (by Newton Terrace), for Colonel Carr-Ellison.

Four houses at the Colliery, Argyle Street, for the Council.

House, Canning Street, for Mr. G. Gordon.

Houghton-le-Spring.—Drill Hall, &c., for the County T.F.A. Messrs. Wright (F.R.I.B.A.) & Chapman (of Newcastle-on-Tyne), architects.

ESSEX.

Benfleet, South.—Church schools: additions (£1,800).

Grays.—Aveley school for 240 places.

Ingatestone and Fryerning.—Boys' and girls' schools: alterations, &c. (£750). Mr. A. E. Christy, F.S.I. (of London), architect.

HAMPSHIRE.

Odiham.—Three almshouses.

Petersfield.—Workhouse: sick wards.

KENT.

Chatham.—House, Athelstan Road, for Mr. H. P. Hughes. House, Upper Luton Road, for Mr. G. B. Silver.

Gillingham.—Lyceum Theatre and Picture Palace, High Street. Mr. G. E. Bond (of Rochester), architect.

Margate.—Flats and shops, Northdown Road. Messrs. Reeve & Reeve, architects.

Sevenoaks.—Special instruction centre. Mr. W. H. Robinson, F.S.I. (of London), architect.

LANCASHIRE.

Bury.—County police divisional headquarters, Tenterden Street (£14,000 to £15,000). Mr. H. Littler (of Preston), County architect.

Liverpool.—Public elementary school for 1,000 places, Netherfield Road South.

MIDDLESEX.

Southall.—Council school, North Road: enlargement by 400 places.

MONMOUTHSHIRE.

Little Mill.—Reformatory school. Mr. J. Bain, F.R.I.B.A. (of Newport), architect.

NORFOLK.

Hindolvestone.—(Supplementary to last issue.)—Church. Mr. H. J. Green, A.R.I.B.A. (of Norwich), architect.

NORTHAMPTONSHIRE.

Northampton.—Girls' High School.

NOTTINGHAMSHIRE.

Basford.—Workhouse: Nurses' Home (accommodation for eight to ten) £2,500.

RUTLAND.

Oakham.—All Saints' Church: improvements (£600).

STAFFORDSHIRE.

Audley.—Primitive Methodist Sunday school (£2,500).

Burton-on-Trent.—Workhouse: Children's Homes, near Belvedere Road (£1,200).

Hanley.—Dispensary.

Lichfield.—Workhouse additions. Mr. R. J. Barnes, architect.

Stafford.—Forty working-class houses, Blakiston and Harrowby Streets.

County Lunatic Asylum: Nurses' Home. Mr. W. J. Nevett, County architect.

Walsall.—Post Office.

SUFFOLK.

Debenham.—Sir Robert Hitcham Girls' school: enlargement by fifty places, &c. Mr. E. G. Fordham (of Ipswich), architect.

SUSSEX.

Berhill-on-Sea.—Bungalow, Lionel Road. Mr. G. H. Gray, architect.

House, Sutherland Avenue. Mr. G. Shoesmith, architect.

House, Manor Road, for Mr. W. Shannon.

Motor-house, Dorset Road. Mr. J. B. Wall, F.R.I.B.A., architect.

Cinematograph Theatre, Western Road. Mr. P. D. Stonham (of Eastbourne), architect.

York Private Hotel, Sea Road: extensions. Messrs. Tubbs & Messer (of London), architects.

Brighton.—School, Southern Cross. Mr. G. M. Simpson, A.R.I.B.A., architect.

WORCESTERSHIRE.

Dudley.—St. John's Church (£3,000).

Malvern Link.—Council school enlargement (£700).

YORKSHIRE.

Cloghton.—Parish church: additions. Messrs. Walker (F.R.I.B.A.) & Son (of Hull), architects.

Elsecar.—Market Hotel: additions for Mappin's Masbro' Old Brewery Co., Ltd. (of Rotherham).

Harrogate.—Council school.

WALES.

Llandovery.—College: laboratories and class-rooms. Mr. Ll. B. Price, B.A. (of Lampeter), architect.

Port Talbot.—Hospital, Aberavon. Mr. F. B. Smith, architect.

Sealand (Flintshire).—Public Elementary school for 320 places. Mr. S. Evans (of Mold), County surveyor.

SCOTLAND.

Aberdeen.—Factory, Rose Street: alterations. Messrs. Jenkins & Marr, architects.

Ferryhill Mills, Albury Road: additions. Messrs. Wilsons & Walker, architects.

SCOTLAND—continued.

Airdrie.—Fever hospital (£12,000).

Arbroath.—Public baths. Mr. P. C. Smith, Burgh surveyor.

Buckie.—Wesleyan Methodist church, Portessie (£2,000).

Edinburgh.—Nursing Home for mental cases (accommodation for thirty to thirty-five beds).

Stirling.—Caledonian Railway Co.'s station (£30,000 to £40,000).

IRELAND.

Athenry (near).—Sanatorium and medical superintendent's house, &c. Mr. W. A. Scott (as below), architect.

Belfast.—Vested school, Edinburgh Street. Mr. T. Houston, architect.

Cork.—St. Fin Barre's Cathedral: chancel completion (£1,500 to £2,000).

Galway.—Dispensary. Mr. W. A. Scott, A.R.I.B.A., M.R.I.A.I. (of Dublin), architect.

BRITISH PATENT SPECIFICATIONS.

Selected and abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 9,114. April 18, 1912.—Improvements in water-heating apparatus. Oswin Hansom, 16 Tithebarn Street, Liverpool. This invention has reference to water-heating apparatus, and more especially to that type of apparatus used for domestic purposes, heated by gas, electricity, or oil, in which

a large reservoir vessel is disposed above and communicates with a smaller and heated vessel. The object is to provide apparatus which is more generally serviceable for domestic purposes, capable of supplying water at a relatively large range of temperatures. Fig. 1 is a diagrammatic elevation, partly in section, showing the apparatus fitted to a gas or electric cooker. The boiler proper or lower vessel *a*, in which the water is actually heated by the heating medium applied to the lower plate *b*, comprises a casing with a partition

or diaphragm *d* across it of double form, with an air space *d'* between them, so as to limit the conduction of heat from the boiler *a* upwards; and directly upon this lower boiler portion *a* the upper portion or accumulator vessel *e*, which is of relatively large capacity, is placed, this vessel *e* being closed above by a roof plate. The double vessel *e*, diaphragm *d*, and bottom plate *b* (and also a lower ring stand) are all secured together by bolts and nuts on the outside. The upper vessel *e* and also the lower part or chamber *a* may be lagged. Between the double diaphragm *d* and the upper part of the accumulator vessel *e* an internal pipe *h* extends, and between the space above and beneath it is a conduit *i*, having a cock or valve upon it, by which the lower part of the vessel *e* and the vessel *a* are put in and out of communication, the upper part of the vessel *e* and the boiler part *a* being always in communication by the pipe *h*. Cold water is admitted to the vessel *e* by an inlet pipe *k* from a tank or other service, and the hot water to the bath, sink, and other taps is carried away from the upper part of the vessel *e* by the pipe *l*. A branch or pipe *m* is provided in the casing *c* of the boiler vessel *a* for drawing off boiling water from this vessel. In action when it is desired to heat water, say, to a medium temperature in the large or accumulator vessel *e*, the communicating controlling cock or tap is opened, so that the lower part of the chamber *e* is put in communication with the boiler *a* by way of the conduit *i*, which it controls; and the water heated in the lower and primary boiler *a* passes up the pipe *h* on the partition or diaphragm *d* to the upper part of the vessel *e*, and the cooler water from the lower part of the vessel *e* flows by communicating conduit *i* into the lower vessel or primary boiler *a*, and thus it is circulated continuously. In this condition water of medium temperature may be drawn off by the pipe *l* for various uses in the house.—Nov. 20, 1912.

PATENT SPECIFICATIONS PUBLISHED
DECEMBER 19, 1912.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

NORTHERN BUILDERS' FEDERATION.

THE annual meeting of the Northern Counties Builders' Federation was held at South Shields, when the following officers were elected:—President, Mr. W. T. Weir, Howdon-on-Tyne; Vice-presidents, Messrs. John Guthrie, Darlington, and John T. Armstrong, South Shields; Hon. Treasurer, Mr. John W. White, Sunderland; Hon. Auditors, Messrs. Percy Bray, Middlesbrough, and Thomas Anderson, South Shields.

An Executive Council was elected as follows:—Messrs. W. T. Weir, John Guthrie, John T. Armstrong, John Proud, Alex. Ross, Fred W. Ranken, Wm. B. Cooper, Robert J. Huntley, John W. White, G. Douglas, Stephen Easten, W. J. Robertson, W. Foster, R. Johnson, J. Simpson, J. Pelton, T. Brown, H. Doughty, and W. M. Thompson.

The following representatives were elected upon the Council of the National Federation:—Messrs. Stephen Easten, T. Wilkinson, J. W. White (John W. White, Sunderland, is a member ex-officio). On the National Conciliation Board, Messrs. John W. White and John Proud. On the Northern Centre Council, Messrs. Stephen Easten, John Proud, Wm. B. Cooper (J. W. White, ex-officio). On the Northern Centre Conciliation Board, Messrs. Stephen Easten and T. Wilkinson.

THE SOCIETY OF ENGINEERS (INCORPORATED).

THE third annual general meeting of the Society of Engineers (Incorporated) was held at the Society's offices, 17 Victoria Street, Westminster, on Monday, December 9, Mr. John Kennedy, President, being in the chair.

The report of the scrutineers of the postal ballot for the election of Council and officers for 1912 showed that the following had been duly elected: President, Arthur Valon; Vice-Presidents, H. C. H. Shenton, Norman Scorgie, T. E. Bower; Members of Council, Henry Adams, C. T. Walrond, Percy Griffith, H. C. Adams, J. R. Bell, S. Cowper-Coles, H. P. Maybury, B. H. M. Hewett, F. H. Hummel, G. A. Becks; Associate Member of Council, R. J. Simpson; Hon. Sec. and Treasurer, D. B. Butler.

It was announced that Premiums for papers read at meetings and published in the Journal during 1912 had been awarded as follows:

The President's Gold Medal to Mr. W. P. Durnall, for his paper on "The Generation and Electrical Transmission of Power for Marine Transportation."

The Bessemer Premium, value £5 5s., to Professor Herbert Chatley, for his paper on "Resistance to Rolling."

The Clarke Premium, value £5 5s., to Mr. Gerald O. Case, for his paper on "Ligno-Concrete."

The Bernays' Premium, value £2 2s., to Mr. J. P. Harris, for his paper on "The Construction of a London County Council Low Level Sewer from Battersea to Deptford."

A Society's Premium, value £2 2s., to Mr. P. J. Waldram, for his paper entitled "Test Deflections in Reinforced Concrete."

A resolution was passed thanking the other gentlemen who had presented papers during the year, some of whom, being members of the Council, were not eligible to receive Premiums.

INCORPORATED CHURCH BUILDING SOCIETY.

THIS Society held its usual monthly meeting on Thursday, December 19, at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W. The Hon. Sir E. P. Thesiger, K.C.B., was in the chair. There were also present the Rev. A. G. Ingram, the Rev. H. W. E. Molony, Lieut.-Col. the Hon. G. H. W. Windsor-Clive, Messrs. George Cowell, F.R.C.S., E. Lee-Warner, J. E. Ollivant, F. H. Rivington, Lewis Wigram, and the Rev. T. T. Norgate, F.R.G.S., F.R.Hist.S. (Secretary). Grants of money were made in aid of the following objects—viz.: Rebuilding the church of St. Mary Magdalene, Stowell, Somerset, £60; and towards enlarging and otherwise improving the accommodation in the churches at Dymchurch, St. Peter and St. Paul, Kent, £40; and Pleaseley Hill, St. Barnabas, Notts, £50. The following grants were also paid for works completed: King Cross, St. Paul, Halifax, £250; Langley Mill, St. Andrew, Derbyshire, £150; Taplow, St. Nicholas, Bucks, £150; Colne, Holy Trinity, Lancs., £120; Headstone, St. George, Middlesex, £100; Gringley-on-the-Hill, St. Peter and St. Paul, Doncaster, £50; East Wickham, St. Michael, Welling, Kent, £50; Fitzroy Square, St. John, Middlesex, £40; Hendon, St. Paul, Sunderland, £30; and Rathmell, Holy Trinity, Yorks., £10. In addition to this the sum of £100 was paid towards the repairs of five churches from Trust Funds held by the Society.

The Committee appeals to Churchpeople for liberal donations to this old Society before the end of the year. At this time, when charitable donors are making special gifts, it is hoped that this, an essential branch of the Home Mission work of the Church, will be prominent in their recognition. The Society is badly in need of help in order to meet adequately many pressing applications now before it, their number being quite abnormal.

VARIETIES.

THE Manchester City Council have agreed to put an end to the present unsightly appearance of the old infirmary site. The ground is to be levelled, sown with grass, and provided with cross paths at a probable cost of over £1,000.

THE Secretary for Scotland stated in the House of Commons last week that there had been seven cases of bankruptcies of builders in Scotland during 1911, as compared with twelve and ten for the two preceding years. This number is lower than any other twelve months since 1903.

MR. GEORGE ECKLES, of Sans Leon, Carr Lane, Bridlington, and late of Hull, builders' merchant and brick and tile manufacturer, left estate of the gross value of £89,320 9s. 8d., of which the net personalty has been sworn at £842 17s. 4d.

THE Salford Borough Council have adopted the report of the Gas Committee recommending the purchase of a plot of land in Liverpool Street, containing 38,790 square yards, from the Earl of Ellesmere, for gasworks purposes, at a total cost, including payments for paving charges, buildings, and plant upon the land, cost of new roadway and boundary walls, &c., of £53,000. Direct application will be made to the Local Government Board for sanction to borrow the money.

THE Seaham Harbour Urban Council have decided upon a scheme for the erection of sixty-nine workmen's dwellings, and to proceed with the erection of forty-eight of them as soon as the sanction of the Local Government Board has been obtained for the borrowing of the necessary money. The site, on the south of the town, covers 2,874 acres, and is offered by Lord Londonderry at £550 per acre. The houses will be twenty-four to the acre, self-contained in blocks of five to six. Access to back doors will be through passages between each block. Each house will have a back garden 26 feet by 16 feet, and the back yards will have a clear paved area of 150 square feet. The houses will consist of a living-room 15 feet 3 inches by 14 feet on the ground floor, and also a scullery. Room has been left in the scullery for the insertion of a bath. On the first floor will be two bedrooms, one 15 feet 3 inches by 12 feet 3 inches, and the other 11 feet 9 inches by 12 feet. Joint wash-houses will be provided, well away from the dwellings. The rents will be 6s. per week. The total loan required for the sixty-nine houses will be £14,909 10s., and the scheme will not become a charge on the rates.
